A.

Address at Worcester, Hampshire, &c. Cattle Shows, by H. Colman, 1
 Address before Essex Agricultural Society, by A. Putnam, 308
 Address before Middlesex Agricultural Society, by H. Colman, 333
 Address of Judge Buel before the Agricultural and Horticultural Society of New Haven, 197
 Affliction of a mother, 228
 Agriculture, state of, in U. States, 2—in Virginia, 13
 Agriculture of Massachusetts, 2d report, 21—3d do. 386
 Agriculture, encouragement to, in Massachusetts, 402, 410, 426
 Agriculture in England, present state of, 224, 229, 237, 248, 256
 Agriculture in Europe, 194—among the Romans, 136
 Agricultural census, 414—gatherings, 5—meetings, importance of, 5
 Agricultural exhibition at Concord, 122—at Worcester, 39, 138—at Essex county, 111—Middlesex county, 133—at Pawtucket, 141—at Bristol, 150—at Plymouth, 174—reports of committees of Plymouth co. 174, 175, 176, 311, 383, 391, 399, 407
 Agricultural notice of Worcester Agricultural Society, by H. C. 146—reports of committees of Worcester co. 157, 158, 163, 166, 167, 173, 181
 Agricultural Society, Essex, transactions of, 354, 375, 376, 401—notice of, by H. C. 114
 Agricultural Society of Massachusetts. (See Mass. Ag. Society)
 Agricultural Convention in S. Carolina, 207
 AGRICULTURAL MEETING AT THE STATE HOUSE, II. C.'s invitation to attend an, 210
 First meeting, Webster's and Professor Silliman's Addresses, 242, 245—Second do. committees chosen, 258—Third do. Soils and Manures, 266, 269—Wm. A. Hayes, Esq's remarks at, 272—Fourth do. Hon. Isaac Hill present, 274—Fifth do. Indian Corn, 282, 290—Sixth do. E. H. Derby, account of his farm, 296—Seventh do. Col. Duncan on Wheat, 298—Eighth do. misc. lectures, 306—Ninth do. Silk, 314—Tenth do. Beet Sugar, 322
 Agricultural improvements, 241
 Agricultural Warehouses, account of, in the U. States,

tion on Bees, 118—Farmer's garden, 35—on Forest Trees, 181
 Bacon, making of, 225
 Bards, hints on handling, 288
 Bartlett's, Franklin, statement on cows, 375
 Berratt's, Joseph, remarks on canker worms, 392
 Barrall, J. seph, on the curculio, 398
 Beet Sugar, M. Duroy's proposition to manufacture, 46
 Beet Sugar manufactured by M. Duroy 54
 Beet Sugar, notice of Child's treatise on, 221
 Beet Sugar, remarks on, by H. C., 42
 Beet Sugar, preparation for making in various places, 462
 Beet Sugar, report on premiums by Mass. Ag. Soc. 274
 Beet Sugar, first manufacture of, in N. England, 384
 Bean Pods poisonous to swine, 328
 Bee hive, notice of a model of, 315
 Bees, notice of J. M. Week's essay on, 370
 Bees, interesting communication on, by W. B., 118
 Bear, capture of, 268
 Betting, danger of, 6
 Berkshire pigs account of E. Plinney's, 71
 Berkshire pigs, C. N. Bement's communication on, 145, 245
 Berkshire pigs, W. S. Turner's reply to C. N. Bement.
 Berkshire pigs, caution to beware of imposition, 231
 Berkshire and other hogs, 192
 Bement, C. N., communication on Berkshire pig, 140, 241
 Benefactors of the world, 70
 Billaudeau Cabbage, 213
 Birds, destruction of, 416
 Bird's benevolence in, by J. B., 280—exhortation to protect, 330
 Birds and Canker worms, 266
 Birds of Massachusetts, 156
 Bird story, 96
 Blast, a disease, 517
 Boys, letter from Peter Jones about, 321
 Pottomless meadow, 113
 Bone as a manure, 367
 Bounty on wheat, decision of H. C. in a contested case, 226
 Botany, knowledge of, important to farmers, by W. B. 287
 Botsy, Joseph, remarks on beet sugar, 46—On book

C.

Cabbages, food for hogs, 385—description of, 40
 Canker Worms, remedy applied frequently injurious, 406
 —remarks of Joseph Burrell Quincy, 398—German mode of preventing, 414—notice of, 425—prevented by leaden troughs, 329—encouragement of birds best remedy, 236—essay on, 120
 Calves, treatment of, 40—raising of, 320—fatal disease in, 422
 Carrot, remarks on, 30, and ruta baga—method of preserving carrot, 46, 170
 Cattle show at Hardwick, notice of 146—at Worcester, 138, 145—at Bristol, 150—at Concord, notice of, 122, 123—Rhode Island Society, 141—at Plymouth, 174
 Cattle, watering in the winter, 217—bringing them to the barn, 175
 Camomile, a decoction of leaves to destroy insects, 119
 Canine, caution, carrot, cast, castration, 46
 Catarra, cattle, chalk, chaff cutter, charcoal, 47
 Celorium, 40—eat. the bite of, 140
 Capital invested in agriculture, 279
 Capons, Chinese mode of making, 127—operation barbarous, 127
 Celery, cultivation of, 254
 Cheese, chemistry, cellar, 47
 Change of food, its effects upon the animal system, 41
 Change of soil, effecting a change of plants, 241
 Chloride of soda, method of using, 86
 Charcoal, nutritive qualities of, 86—description of, 47
 Chinese Tree Corn E. P. Roberts account of successful cultivation, 185—communication of G. Thurburn and Dr. Green on p. 211
 Choice of employment, 265
 Chandler, Capt. Daniel, report on the agriculture of the House of Industry, 326
 Chickens, rearing of, 425
 Chopping hay, 390
 Child, David Lee, notice of his Treatise on Sugar Beet and Beet Sugar, 221
 Cisterns, manner of constructing, 4
 Cider and Apples, 406
 Circumscbed Farmer, 85
 Clover, gigantic variety, 33—sowing of clover seed, 131
 —seed, respecting the quantities to be sowed on an acre, 71

178—obituary notice of Theodore Sedgwick, Esq. 178—bringing cattle to the barn, 178—silk reel, 186—materials for manure, 186—agriculture in Europe, 194—notice of Cultivators Almanac, 194—Westboro Agricultural Society, 202—watering cattle in winter, 217—soiling, 217—silk convention at Washington, 218—Dillingham potatoes, 218—decision in a contested case, 224—remarks on premium butter, 234—notice of Westboro agricultural meeting, 250—science and agriculture, 258—obituary notice of Hon. J. Lowell, 214—notice of model hoe hive, 315—address before the Middlesex Agricultural Society, 337—poultry management and butter, 338—value of punctuality, 346—remarks on poultry, 350—on silk culture, 364—notice of Week's Essay on Bees, 370—of Florida Bostonians, 370—notice of Third Report of Agriculture, 384—remarks on Massachusetts agricultural premiums, 394—address at cattle show at Worcester, &c. 1—on the season, 18—hayage, 18—rutu bago and bone manure, 18—Independence, 48—Second Report of Agriculture of Massachusetts, 21—on beet sugar and silk, 402—on arrangement to agriculture in Massachusetts, 402, 410, 426—labor saving machines, 410—opening Western Railroad, 123—notice of cattle show at Worcester, 138—speculation, 186

Corn, expenses of cultivating an acre, 21—harvesting, by H. C. 74—crops, Hon. Isaac Hill's account of large crops, 189—Brown's account of large crops, 190

Cows, milk and heifers, Essex Agricultural Reports on, 375—on stripping them, 409—a good one, butter, &c., 56—extraordinary one, 29—holding up their milk, inquiries about, 145—holding up their milk, remedy for 155—importance of their having access to good water, 135

Cruelty to Animals, 153

Crops, 21—in Western New York, 5, 38—ploughed in as a manure, 432

Creeper Wheat, 106

Cranes, remedy for, 3

Cross breeding in the vegetable kingdom, 319

Curelon, Joel Burnett's account of, 304—remarks on 431—do, by Dr James Thatcher, 343—by Joseph Barreille Quincy, 398

Curtis, Inven, of Sheffield, remarks on grain at agricultural meeting, 307

Cucumber and Melons, 345

Culture of Ruta Baga, 89—of the mind, 52

D.

Day for labor, night for rest, 346

Dairy management, 112—dairy and smiling, 30

Dana, Samuel L., on ploughing in crops for manure, 432

Dearborn, H. A. S., on Billaudem cabbage, 213—speech at the agricultural meeting, 301

Degeneracy in Plants and Animals, causes of, 337

Denston Lequent drain system, 261

Derby, E. H., account of his farm at sixth agricultural meeting, 206

Denny, George, on butter made on his farm, 318

Dew, theory of, 353

Diseases in Cattle, remedy for, 33—animals, 359—of horses, 261

Dictionary of terms used in agriculture, 40, 46

Dillingham between labor and son, 152, 159

Dillingham Potatoes, 218

Dirty Stables, ill effect of, 358

Dodge, Pickering, of Salem, on the first manufacture of beet sugar in New England, 384

Dog, fidelity of one, 196—anecdote of, 204—faithfulness of one, 268

Domestic economy, 15, 308

Downing, J. A., on the culture of the strawberry, 48

Drought, destroying mulberry cuttings, 40

Doncan, Col., on wheat at agricultural meeting, 298

Durham Cattle, 102—half bred harder than the pure, 177

Dumb Creation, a word for, 96

Duroy, M., on beet sugar, 46

Dutch Butter, 17

Dysentary, receipt to cure, 73

E.

Early Rising, advantages of, 49

Education of Farmers, by H. C., 30, 72—by H. C. Merriam, 281—J. Holbrook, 9, 16, 55—thoughts on, by Dr Humphrey, 177—qualifications of teachers, 192, 200, 209, 225—school houses, 183

Eggs, poultry, 351—value of, 89

Elsworth, H. W., notice of Treatise on Swine, 201

Election of Governors, 251

Entomology of the Canker Worm, 120—knowledge of, important to farmers, 311

Enquiry about a hunting match in Rowley, 352

Encouragement to agriculture in Massachusetts, 402, 410, 436

Essex Agricultural Society, notice of, by H. C., 114—address before, by A. Putnam, 300—transactions of, 354—reports on cows, 375—reports on reclaimed meadows, 376—agriculture, 401

Ethan Allen in England, 260

Essay of an Amateur Farmer, 110

Every thing in its place, 345

Expenses and profit of crops, 21—of cultivation of an acre of corn in Sheffield, 21

Experience, importance of, 100

Execution and extraordinary scene at Athens, 148

Excretion of plants, 230, 253

F.

Farm Wall, 238—accounts and profits, 233

Farming, thoughts on, 113—profits, 26

Farmers, hints to, 198—happy lot, 177—circular, H. C., 162—gardens, by W. B., 38—on lazy one, 66—a circumscribed one, 84—cabinets, by J. Holbrook, 31—education, 59, 72—value of observation to, 87

Fashions, origin of, 20

Farmer, 131

Fences, 360

Flora Bostonensis, notice of, by H. C., 13

Flax culture, 161

Flour speculators and the banks, 6

Forest Trees, their importance, sowing the seed, 181—on planting the seed by M. Allen, 111—inquires about, 111

Fosses Inodores, 193

Founder in horses, a cure for, 29

Fruits, mixture of, 377—trees, proper time for pruning, 339—advantage of planting near a wall, 119

Franch, B. V. Esq., remarks at eighth agricultural meeting, 306

Free martins, 41

Franklin County Agricultural Society, address before, by H. C., 1

Franklin and Legislative Chaplains, 172

Foster, William, letters from, read at sixth agricultural meeting, 312—on agriculture in France and Spain, 341—communication on irrigation and management of water, 373—on agriculture, 400—cider and apples, 406—power of water, 424

G.

Garlic, extirpation of, 39, 49

Gargo, saltpetre a remedy for, 81

Geology and agriculture of Wheatland, 12—of Maine, review of third report, by H. C. 58, 66, 82, 98

Gillies, 17

Gigantic Clover, 33

Good work advancing, 240

Goodwill on cross breeding in the vegetable kingdom, 219

Grain Plants, 49—crop of 1838, 136—preservation of, 223

Gratitude, 203

Grapes, native, from Mr Perry, 122

Great Men, the end of, 60—wall of China, 268

Green crops as manure, 354, 432—of Indian corn, 110—manuring with peas, 216

Growth of plants, 264

ii.

Hampshire cattle show, address by H. C., 1

Haggenston, David, communication on rose bush slug, 418

Hard times, 132

Harvest, prospects, 31

Haskell, Calvin, notice of his silk farm, 104

Harvesting corn, by H. C., 74

Haus, curing of, by H. Fowle, 40

Hay, the way to be, 140—condition of the New England Farmer, 191

Hays, William A., remarks at agricultural meeting, 272

Hay, making, 430—racks, best way of placing, 8—change in English, 278—tea for swine, 253

Haying, by H. C., 18, 74

Health, compensation to farmers favorable to it, 73

Heu crops, 33

Hins to farmers, 198—for the season, 143

Historical incident, 1, 256

Hilling potatoes, 17—plants, 10

Hite, James S. queries on sugar Beet, 45

Horticultural Society, New York, annual exhibition, 100—Massachusetts, annual exhibition fruits and vegetables, 129—flowers, 128—committee of arrangements

for annual exhibition, 27—premiums awarded for earthenware, 27—notice of exhibition, by H. C. 130—premiums offered for fruits 1810, 377—for flowers, 378—and vegetables 1840, 378—premiums awarded for crops on vegetables, 257—on fruits, 304—on flowers, 303—premium offered for rose bush slug, 294, 418—Exhibitions, 7, 19, 27, 31, 42, 50, 55, 58, 63, 78, 97, 106, 113, 135, 146, 151, 155, 162, 170, 178, 189, 255, 278, 394, 402, 410, 418, 422, 434

Hog, notice of a large one, 249—weight of fine ones raised by E. Thimney, 283—great weight of, 98—gold in Providence, 231—description of Russian, 169

Horses, slobbering, causes of, 11, 96—and cattle, to cure wounds on, 96—hints on the cure of, 273

Honest poverty rewarded, 394

Honey-dew, causes of, 97

Holbrook on education of farmers, 9, 16, 25, 33—on geology and agriculture of Wheatland, 12—on farmers' cabinets, 31

House plants, 31

House wife, rule for, 252

Housewifery, a hint in, 56

House of Industry, report of the agriculture by Captain D Chandler, 256

Howard, J. E., success in cultivating Rohan Potatoes, 313

Hov to be rich, 8

Husbandman, life of, 225

Humphrey's Thoughts on Education, common schools, 177—school houses, 183—qualifications of teachers, 192, 200, 209, 225

Hunt, Thomas, remarks on poultry management, 330—answer to inquiry relative to poultry, 362

Hunting Deer by steam, 100

Hydrargy, how to change the color of the flower, 65

H. Vase on education of farmers, 39, 72.

I.

Illinois, description of the face of the country, 84

Independence, by H. C. 18

Indian corn crop, Isaac Hill's account of large crops in N. H., 189—green crop of, 110—suckering, 34—benefits of ploughing in the manure for, 207—successful cultivation of, 263—discussion on the culture at the state house, 282—crop, by M. A. 336—John Brown, account of crop, 190—account of Samuel Hartwell's crop, 286

Influence of climate upon seed, 95—of native magnesia, on the germination, vegetation and fructification of vegetables, 45

Internal Improvements, 124

Industry rewarded, 284

Insects, prevention against, 330

Improved stock, 247

Importations into our country too great for our prosperity, 64

J.

Jackson's, C. J., Report on Geology of Maine, review of, by H. C. 66, 58, 82, 98—on manure from peat and lime, 77—on soils and manures at third agricultural meeting, 208

Jarvis, Leonard, on culture of ruta bago, 89

Jacobs, J. R. answers to the interrogatories of the Massachusetts Agricultural Society, 344

Jewish nation, article, 430

Jewish nation, statistics of, 372

Junial anecdote, 208

K.

Kentick, W., the effect of slavery on agriculture in Virginia, 123—essay on silk culture, new system, 365

Keep, N. C., letter to C. T. Jackson on peat, 78—essay of an amateur farmer, 110

Keeping truth in the dark, 364

Keely, John, on turning in green crops, 354

Knowledge under difficulties, 132—pursuit of, 140

Kirkland, Rev. Dr., biographical sketch of, 38

L.

Laborers, comparison of the Americans with the English, 193

Labor and labor saving machines, 208, 410

Landlord, a tender hearted one, 348

Lazy farmer, by B. S. 65

Lands, exhausted, too soon abandoned, 239

Lawton, Joshua K., letter from, explaining his mode of cultivation, 327

Letton, J. D., essay on swine breeding, 167

Lightning rods, 423

Lime, efficacy in preventing insect depredations, 91—remarks on the use in agriculture, 81—benefits of, 88

a manure, 112—use of it, 105, 450—on wheat crop, influence of, 145—Ruffin on calcareous manures, 344
 Lining and wheat on clover, 193—benefit of, and green-manuring with peas, 216
 Live and dead, 148
 Lincoln, William, report on swine, 181
 Lowell, Hon. John, obituary notice, 314
 Lowell Horticultural Society, notice of, 83—first exhibition of, 106
 Loams management of sandy, 135
 London dairies, 219, 257.
 Loest tree, Daniel Stebbins account of his plantation, 327
 Lucerne, cultivation of, 417
 Lying, 100

M.

Marl, its incinerating effect, 136—experiment with, 306
 Madison's homestead, 220
 Mammoth pear, 241
 Man's necessities his greatest temporal blessing, 191
 Manure, accumulating of, 136, 173—from peat and lime, 17—from sea weed and dry straw, 121—application of, 54—materials for, by H. C. 86—urate and pou-drette, 125—nutritive, 316—experiments in, 354—use of long, 414—bad ill effects of dirty stable, 329—application of, by James A. Garrett, 62
 Manuring, cheap, 57
 Mackey pigs, Mr Phinney's, 701
 Marsh mud, experiment with, 434
 Management of the dairy, 112
 Massachusetts Horticultural Society, see Horticultural Society—Society for Promoting Agriculture, premium list 1833, 14, 23—remarks on premiums, by H. C. 50—premiums for butter and cheese awarded, 202—report of committee on butter, 224—report on best sugar premiums, 264—of Dr Stebbins on beet sugar, 384—on best cultivated farms, 283—on vegetable and grain crops, 256—on trees and live hedges, 308—premium farm reports, 325—Ichabod R. Jacob's answers to inquiries, 344—premium list for 1840, 351
 Means and measures of educating farmers, 33
 Meadow land, by W. B., 37
 Merriam, H. C., on education of farmers, 281
 Memorial of agricultural commissioner, 293
 Milch cows, importance of their having access to good water, 135—and heifers, 375
 Milking by women, 50—instructions for, 217
 Milk, the importance of pure, for the supply of New York city, 160—sickness, observations upon, 88
 Milk, time of sowing, great produce of, 30
 Middlesex cattle show at Concord, 134—notice of, by H. C. 122—address before the society, by H. C. 333
 Moore, Col. Abel, notice of his farm, by J. B. 61
 Mole, natural history of, 276
 Monopoly, by H. C. 50
 Morus Multicaulis, failure of cuttings, 40—virtues and value of, 63—tea and cigars made from it, 63—buds, failure of those planted, 64—excitement about, 76—shoots made of it, 100—sales reported, 112—the staple produce of New Jersey, 109—speculation in at an end, 170—bad business, 209
 Mulberry trees, sale of, 62—and the silk business, confidence in, 81—bad business, 209—silk culture in 1772, 112—essay on, by Daniel Stebbins, 385—Massachusetts Agricultural Society's precisions on, remarks, by H. C. 50
 Mutual improvement clubs, 263
 Much ado about nothing, 316
 Mysteries of the Kitchen, 220

N.

Natural history, 60
 New Jersey farming, 109
 Negro fiddler, 100
 New York Poudreite Company, 125
 New York annual horticultural exhibition, 108
 Newspapers, benefits of, 177
 Night soil, 230
 Nichols, Dr. A., statement on manures, 362
 Notes on New Jersey farming, 109
 Northern shepherd, 85
 Notices of tracts, minutes by the way, and E. Phinney's farm, 53, 61—Col. A. Moore's farm, 61—E. L. Pennington's place, 90—Gen. Holman's, 93—Calvin Haskell's, 104—of Essex Agricultural Society, 114—of the Good Housekeeper.

O.

Oats, large ones, 81
 Odds and ends, 60
 Observation, value to farmers, 87

Onions, great yield of, 170—Samuel Newman's account of premium crop, 286
 Ornithology, knowledge of, important to farmers, 358
 Orchards, good effect of swine running in them, 105
 Order, ever thing in its, 132—and regularity, 335
 Osborn, William, on reclaimed meadows,
 Oxen against horses, 56—remedy for pulling off from each other, 199

P.

Pawtucket cattle show and fair, 111—premium list for 1840, 425
 Parental affection, pleasures of, 188
 Pauper farms, 277
 Peach tree borer, 361—pruning of, 382—cutting streak of nature in, 95—coal ashes for their preservation, 167
 Peat meadows, 4—on peat and lime, from Jackson's report, 77
 Peppercil, notice of improvements in, 104
 Penn, William, getting what he wanted 130
 Pennington, E. L. notice of his place, 90
 Perfume of plants, deleterious in confined apartments, 10
 Phinney, E. Esq. notice of his farm, 53—of his pigs and piggy, 71—on the cultivation of wheat, 349—letter to C. F. Jackson on peat, 77
 Pigs and piggy, Mr Phinney's, 71
 Pine, Norfolk Island, 288
 Plant, insect, 356
 Planting trees, 88—seeds, inquiries by W. Ames answered by Rev. M. Allen, 11
 Plymouth cattle show, report of committee, &c. 174—on improvements, 311—spots on silk, working extra, &c. 353—on stock, produce, &c. 391—on inventions, 399—list of premiums for 1840, 356—premiums awarded, 407—remarks on, by H. C. 154, by M. 154
 Poetry. Lecture to the world's people, 8—the stormy Petrel, 92—Yankee girl, 100—our mountains and valleys, 108—the farmer, 132—birds in autumn, 124—farmers' choice, 228—the wild flower, 260—consumption, 292—1 bow not yet, 292—the monkey, 316—the horse, 332—the farmer 380
 Potatoes, frost bitten, observations on, 223—experiment with, 262—planting in the furrow, 334—Gilkes, 17—hilling of, 17—best soil for, varieties and cultivation of, 32—preserving of, 145
 Premiums awarded by Massachusetts Agricultural Society, 203—list of Mass. Agri. So. 15—Plymouth County Society, 356
 Pruning fruit trees, proper time, 399—remarks on premiums of Massachusetts Agricultural Society, by H. C. 50—utility of, force of prejudice, 134
 Politics for farmers, 400
 Poultry, to fatten, and rearing of, 193—on the keeping of, 57—management by Thomas P. Hunt, 330—by T. W. and H. C. 335—inquiries answered by T. P. Hunt, 362—and eggs, 351
 Poudreite, recommendations of, directions for using, &c. 12
 Profits of farming, by H. C. 26—of crops, 21—of an English farm, by J. A. J. 131

AGRICULTURAL.

[From the July No. of the North American Review.]

An Address at the Annual Cattle Shows of the Worcester and the Hampshire, Hampden and Franklin Agricultural Societies, October, 1838. By HENRY COLMAN, Commissioner for the Agricultural Survey of the State. Boston: Otis, Broaders, & Company. 8vo. pp. 23.

Agriculture, the first pursuit of civilized man, has been the last to receive the direct attention and patronage of governments. Commerce, navigation, manufactures, the mechanic and fine arts, science and letters, had commanded much respect and reached high degrees of excellence, before the cultivation of the earth, either for the purposes of profit or embellishment, found favor among the affluent and enlightened, or was deemed an object worthy of the careful consideration of statesmen and legislators. But, when nations have reached an advanced position in prosperity and refinement, and other more attractive or lucrative branches of industry have been so extended, as to employ a large portion of the population, an immensely increased amount of products is required to meet the augmented demand of consumption; and the necessity of rendering the earth more prolific, becomes so apparent, that what had been imprudently neglected, and was, in fact, the most substantially momentous interest of the country, at once imperiously commands the most grave consideration.

As the commercial and mechanical enterprise

by Marshall, several years before, to the Society of Arts in London. The reports of the several commissioners being very voluminous, as they contained exact details relating to practical operations in every department of rural economy, digests were made to render them more available, by the indefatigable projector and collaborator in the execution of this enlarged and efficient plan for advancing the important interests of the whole country. But even in that reduced form, with the other materials which he had individually collected during a period of nearly twenty years, which had been devoted to the subject, for compiling "A Compendious System of English Agriculture," the work consists of fourteen volumes.

The expenditures of Great Britain having rapidly and immensely increased from the commencement and during the progress of the war which followed the French revolution, and nearly half of the whole revenue being derived from direct taxes and the excise, it became of still greater consequence to the land-owners and their tenants, from whom that vast amount of income was chiefly received, to render each acre more productive, by the introduction of every possible improvement in the science and art of cultivation, which genius and skill could create or introduce, from the practice of any other age or country. Interest, knowledge, and industry were, therefore, actively and zealously united in a common cause, and the beneficial results have been truly wonderful. With a territory whose area is not a third, and whose population is only half that of France, and with a soil and climate not so propitious, the agricultural products of England are

equal to those of France. This was accomplished by the "Massachusetts Society for Promoting Agriculture" was incorporated soon after that which was established in England; and the example has been cautiously followed in most of the counties throughout the State, while all have been encouraged and fostered by the seasonable and liberal endowments of the government. Much has been thus accomplished within the present century; but, acting from a yet more enlarged and generous policy, the executive and legislature of the Commonwealth, with a munificence which reflects upon them the greatest honor, directed, two years since, an agricultural survey of each county to be made; and a gentleman was appointed as the commissioner for performing that difficult and laborious duty, who, from his attainments, industry, ardor, and practical experience, was eminently qualified for the station.

This may undoubtedly with propriety and justice be considered one of the most important measures that have been adopted since the organization of the government: for it is immediately interesting, and must be directly beneficial, not only to every citizen who depends upon the cultivation of the earth for his support, but to the whole population, of which the farming class constitutes at least seven-tenths, being, at the same time, the grand nursery and constant source of supply for filling all the other diversified occupations in society.

With a soil naturally as capable of tillage, and to as high a degree of perfection as that of any other region, Massachusetts has been dependent on other States for a large portion of the most indispensable products of agriculture, which are annual

From the first report made by Mr Colman, there is ample testimony to warrant the assertion that Massachusetts is capable of yielding more than triple the amount of agricultural products which have hitherto been obtained. There is not a county which the commissioner has visited, that has not presented examples of tillage, and experiments in all the branches of New England culture, which fully illustrate the immense advantages that are derivable from a skillful application of science to the practical arts of husbandry. This verified and consequently most useful of all kinds of knowledge, but which has been confined within very limited and far separated circles, will hereafter be as universally possessed, through the medium of the reports on each county, as that which has been collected and published on every other subject connected with human industry; and the whole, when completed, in the lucid, exact, and satisfactory manner in which the first has been presented, will, allowing for the extent of territory surveyed, form the most accurate and valuable agricultural cyclopaedia which has appeared in any country. It will include the actual operations of each individual, who has best perfected that portion of rural economy to which his attention had been most exclusively directed, from the nature of the soil, and geographical position as respects a market.

Hitherto all the publications which have appeared on agriculture, have been principally compilations from the various treatises that have been written on that all-important subject, since the period of the illustrious Columella; and, however laborious may have been the authors, and ingeniously faithful in design, or desirous of producing a work which might the most perfectly subserve the purposes of the region of country for which it was intended, it is notorious to every experienced and well instructed farmer and gardener, that they have invariably failed to accomplish what had been so confidently anticipated; and it is evident, to even the most superficial observer, that there is no other mode of concentrating in a really useful form the requisite information, for the general guidance of the uninstructed as well as experienced cultivators of the earth, and of enabling them to participate in the advantages which have been derived from the most approved methods of conducting the multifarious labors of a farm, than that which has fortunately been undertaken by the government of Massachusetts, and which, from what has already been done, we have the fullest confidence will be thoroughly executed. Each of the most skillful and enlightened experimentalists, whose results will be given in the reports of the Agricultural Commissioner, must have consulted the most celebrated authors, and to some extent taken them as guides, for directing them in their diversified operations; and the benefits obtained will be at the command of every citizen.

The agricultural survey is but the continuation and completion of a system, which has been projected for obtaining accurate information, as to the physical geography, topography, natural history, and general statistics of the commonwealth. Massachusetts has been the first of all the States in the Union, to cause a correct map to be constructed, based on the triangulation of its whole area, which involves astronomical observations for estab-

include a whole nation. Happily, however, for the navigation of the United States, the same operation is in progress, under the direction of the national government, for forming complete hydrographical charts of the coast from Passamaquoddy to the Sabine.

Connected with these important labors, a geological survey was undertaken, which has been most ably completed by Professor Hitchcock; and the other departments of natural history, including the animal and vegetable realms, have been directed to be explored, and the duty has been confided to several scientific gentlemen, from whom may be expected full and interesting accounts of the quadrupeds, birds, fishes, reptiles, insects, and plants which are peculiar to the State.

These works will be honorable monuments of the enlightened and expanded views of the Legislature, reflect lasting honor upon the chief magistrates under whose direction they have been so successfully prosecuted, and entitle the enlightened and meritorious gentlemen who have participated in the very responsible labors, to the respect and gratitude of the present and all future generations.

We have indulged so far in the general remarks which the very interesting subject of agriculture has suggested, that there is left only sufficient space to commend to the real friends of the country the instructive address which the Agricultural Commissioner delivered before the assembled yeomanry of several of the interior counties, during the last autumn. It is an impressive appeal to the farmers, urging them strenuously to endeavor to render their condition as prosperous and happy as their pursuits are respectable and important, by renewed efforts in the acquisition of intelligence, and to illustrate, by example, how independent and deserving of the highest consideration are those, who zealously emulate the hardy virtues and rural industry of their adventurous Anglo-Saxon ancestors.

STATE OF AGRICULTURE IN THE UNITED STATES.

That the Agriculture of the United States does not, to use a commercial phrase, rank with that of the most favored nations, is perhaps generally admitted; that it might with proper care be made to do so, does not admit of controversy; and it may be well to inquire into some of the causes that lead to this state of things. With one of the most fertile countries, by nature, on the globe, we do not in the amount of products equal that of some countries much less favored, but which by superior skill in cultivation have attained a fertility unknown among us. As examples of this, we may name England, Belgium, and part of Germany; in which the average per acre of the crops is much greater than in the United States, if we except, perhaps, some few of the best cultivated districts.

In order to determine what *should be*, it is sometimes useful to ascertain what *actually is*. Estimates have been made at different times of the total of agricultural products in this country. Such estimates have no pretensions to exactness; they are only approximations to the precise quantity; still, as similar estimates are made in other countries, they may afford the means of comparison, as showing the proportion of production to the population. The year 1838 was, on the whole, a favora-

ble one hundred millions, and oats at one hundred and fifty millions of bushels; we should not probably be far from the truth. Barley does not rank high in amount as a cultivated crop, though the quantity produced is annually increasing. The wheat is principally grown in the country north of the Potomac and Ohio, and south of the great lakes. The corn is produced chiefly in the south, and in the valleys of the Ohio and Mississippi. Oats are cultivated in all sections unless the extreme south; and are everywhere the principal food of horses, while they are given to cattle, sheep, and swine to a considerable extent. The average crop of wheat on the whole, cannot be estimated per acre at more than eighteen bushels; corn, thirty-five bushels; oats the same; and barley about twenty bushels. This rate will of course vary greatly in different sections. In the States north of the Ohio, the average of corn would perhaps equal or exceed fifty bushels to the acre, while in the States south of the Potomac, it has been estimated as low as fifteen bushels per acre. The difference in the other crops in the several sections of our country would be less, but still it is considerable.

That these average productions might be greatly increased, does not admit of a question; that the interests of agriculture demand that such should be the case, is equally clear. By attention to the selection of seeds and the preparation of the soil, an addition of ten per cent, to these averages might be readily made; experience shows that such is the fact; and multitudes of individual instances might be adduced to prove that such has already been done by skillful and intelligent farmers.

The causes which, in our opinion, have tended more than any others to depress agriculture, and prevent its receiving the attention it demands, as well as to reduce the profits which should reward the laborer are the following. First, a want of respect in the agricultural interest for their own profession. There is a feeling in certain portions of the community, principally those who have done nothing to increase the productive capital of the country themselves, and who may be termed the drones of the social compact, that personal labor is disgraceful, and that the cultivator of the soil is little better than a slave. Strange as it may seem, this feeling may be said to be promoted and perpetuated by the conduct of farmers themselves. There are too many men among us; men who have good farms and who might employ their sons upon them, with the certainty that honorable competence would be the result; who prefer to see them become poor miserable retailers of tape and sugar candy, or second or third rate lawyers, men fit for nothing only to promote litigation, and sow the seeds of strife, and bring into contempt the high principles of right which the law is intended to embody, rather than honest, high-minded, intelligent cultivators of the soil. For this evil, and it is a serious one, the remedy is with the farmer. His sons should be well educated, but they should be taught to feel, what in fact is the case, that in the actual dignity and usefulness of their profession, the farmer has few equals and no superior.

The second cause of the depressed state of agriculture in the United States, is the inattention of farmers in selecting the best breeds of animals for their yards, and the best seeds for planting. In

shown that animals can be formed in the hands of the scientific breeder to meet the wants or remedy the defects of any existing race. Whether it be a beautiful form, weight of carcass, aptitude to fatten, or all these combined in cattle; or the same qualities, with or without wool in sheep; Bakewell, Culy, Berry, and Ellman, have shown that domestic animals in the hands of the farmer who understands the principles of breeding, are as clay in the hands of the potter, to be moulded and transformed at will. The records of Smithfield market, the most decisive evidence that can be produced, prove that the average weight of cattle and sheep has increased one-third within less than half a century. Not less beneficial have been the results which have ensued from attention to improved or new varieties of seeds. The most valuable kinds of wheat, barley, oats and other grain in Europe, and of maize or corn in this country, have been the result of careful selection and long-continued cultivation. Col. Le Conteur, of the Isle of Jersey, who has paid more attention to wheat, and instituted a greater number of experiments in regard to the plant than any other man living, having devoted about twenty years and ample means to the pursuit, states "that the only chances of having pure sorts was to raise them from single grains or single ears, and that the improvements he had made in this way had amply rewarded his labor, as the produce of his crops was increased from an average of about twentythree to twentyfive bushels an acre to about thirtyfour; and since he had raised wheat from single ears, or carefully selected sorts, he has increased his crops to between forty and fifty bushels an acre." Many of the best known kinds of wheat, barley and oats, now grown in Europe, and some of them have been successfully introduced into this country, have been produced from single ears or heads of grain, selected by observing men for some valuable qualities they appeared to possess. Such was the origin of the White Kent and Whittingham wheat; the Chevalier, Arcot and Strain barley; and the Potato.

that matter undergoes in the transformation from inert atoms to organized life. Constantly among plants, and compelled to be familiar with insects, some of both of which he numbers among his worst enemies, he is in part a botanist and entomologist by necessity; and were his observations properly directed, there is nothing to hinder, but much to render farmers the most successful discoverers in these sciences. Works which would give a proper course to his inquiries, may be found at almost every bookstore; and it is not too much to hope, that volumes will be found in every common school and district library which will awaken inquiry, and direct observers, in the successful pursuit of these and other sciences. We think that blame may be attributed, in a greater or less degree, to most of the agricultural publications and periodicals of the day, in not devoting more of their pages to the discussion and elucidation of these topics. It may perhaps be said, that but little is yet known with certainty on these subjects; that chemical analysis, vegetable physiology, and the development of the laws that govern the nutrition of plants and animals, are all as yet in their infancy; still it cannot but be useful to have what is known, spread before the public mind, and if much that is supposed to be certain, should hereafter prove merely theoretical, useful observations will be prompted, and truth eventually established. Agriculture is strictly a science, and should be considered as such. The principles that govern and control matter, are many of them already understood, and no one has any pretensions to the title of a thorough farmer, who is not able to apply such as are known to his course of practice in the field. We have many men who express surprise at the well known fact, that the most skillful and successful farmers we have in the country, are men who have been bred to other pursuits, and never had the management of a farm till they purchased for themselves, and assumed the farmer at once. We think there is nothing surprising in this result. These men brought to the business of ag-

riculture neatness and order. We cannot expect that a man will spend his capital in beautifying and putting his farm in order, in planting, and draining, and repairing, when such expenditures will not repay him more than seven per cent., when by purchasing more, or new lands, there is a probability that 30 or 50 may be realized. It requires too great an effort of self-denial to see our neighbors enlarging their domains to the size of a German principality, while we are expected to be content with some two or four hundred acres. We have as a body of farmers yet to learn that the products of a small farm in proportion to the capital invested are usually greater than on large farms. We have yet to acquire a taste for small, neat, well finished and well furnished houses, in preference to the enormous 'shingle palaces' which we take such a delight in erecting; and when shall we learn that a few acres, well fenced, kept clean of foul weeds, and growing richer and more productive yearly, is better than many acres, with the fences rotted or thrown down, the fields and the crops choked with pernicious weeds, and the soil, from the wretched course of cultivation, annually deteriorating in value and productiveness. It is a very poor plan in farmers to wear out and impoverish what land they have, because they can buy more; better raise a few acres to the height of fertility, place it in perfect order, and then, if there is any surplus capital, after attending to the moral and intellectual wants of the family, it may be expended in more lands to be gradually brought to the same state.

Such are some of the most prominent causes that in our estimation have contributed to place agriculture where it now is; not as bad, it is true, as it was some twenty-five years since; but still very far from what it might be, and what it would be, if farmers would awake to their own interests. It is idle to blame the German peasant, or the Russian serf for transmitting to us their surplus grain; they would never do it if we supplied the market with home grain, as we certainly and easily might;

RAIN WATER CISTERNS.

The importance of having a supply of water in the barn yard for cattle, has already been adverted to in the Cabinet, and it is a subject which cannot be too strongly impressed on the minds of farmers. The quantity of manure lost by driving stock twice a day to water, is much greater than is generally supposed, for the droppings are most copiously deposited immediately after drinking. In many situations water is easily procured from wells of moderate depth and at little cost, compared with the benefit derived; and in all situations cisterns may be built, and the water from roofs conveyed into them at a very small expense, when contrasted with the advantage resulting from them. In this climate, the average fall of rain annually is about three feet, which furnishes about twenty gallons of water for each square foot of surface during the year, and from these data it is easy to estimate the quantity which may be collected from a building of any given dimensions. A cistern will cost from 25 to 50 dollars, built after the best manner, and the best is always the cheapest in the end; the interest on this is from \$1.50 to \$3 a year, being a sum far below the expense and trouble of taking the cattle to water, without reference to the great loss of manure.

The following table shows about the number of gallons of water contained in cisterns of the following diameters in the clear for each foot of their depth, viz:

Diameter.	Gallons.
5 feet	120
6 feet	170
7 feet	230
8 feet	308
9 feet	390
10 feet	480

By multiplying the number of gallons here stated by the depth of the cistern in feet, the product will be the number of gallons it will contain sufficiently near for any practical purpose.

The circular form is preferable to any other for a cistern, as it possesses greater strength with less materials; the principle of the arch keeping the parts combined together. Where they are constructed with brick, the width of a brick is sufficient for the thickness of the wall; where stone is used, the wall must necessarily be thicker, but the main matter is to have the mortar well made of the best clean sand, and not too much lime, and great care must be taken that all the interstices are well filled in, so as not to admit the water to escape. A coat of plastering well put on, of common mortar, made in the best manner, with no more lime than is absolutely necessary to coat the sand and cause it to work evenly, has been found to be a complete protection against leakage, but the whole should be executed in a masterly manner by a careful, conscientious workman; otherwise, you will have a broken cistern holding no water. Those who are disposed to incur a little more expense, may procure Roman cement, or water lime, such as is much used in the construction of locks for artificial navigation for plastering, and when used, it should not be put on thick, but as evenly as possible; and in the use of this article a second coat should never be applied over the first; all that is done should be done at once; it will not adhere well and would soon peel off, and endanger the stability of the cistern, even though it is sealed.

Cisterns have been in use from the earliest period of which we have any historical account, and in modern times many have been constructed, which have been long in use, and which their owners would not dispense with for ten times their original cost; therefore let those who are destitute of other means of furnishing water to their stock in their barn yards, proceed at as early a period of time as practicable, to construct a cistern in the best manner, and in two years the saving of time, trouble and manure, will repay the cost with interest. Therefore

"Build for yourselves cisterns holding water."

Farmer's Cabinet.

PEAT MEADOWS.

As planting is now over, some farmers will begin to think of their peat swamps. We have tried various modes to bring these into English grass, and have never failed to do it when we persevered.

On commencing our editorial course last January, we resolved not to attempt to lead our brother farmers into any expensive process of farming which might never yield an adequate return.

We well know it is quite easy to recommend the purchase of manures—the making of compost heaps—the raising of grain to supply the whole State, &c. &c. It is always much easier to show us how to lay out ten dollars on a farm than to show us how to get a return of ten for an outlay of five.

As our search is after truth, we shall ever admit into our columns the opinions and the statements of others who may think differently from us—for these opinions thus admitted we are not accountable, and we wish our patrons to take them for just what they are worth. But there is another class of opinions for which we feel ourselves responsible; and we must beg our readers to distinguish our own recommendations from the theories of others which are admitted into our columns.

On the subject of reclaiming peat lands and bog meadows, we have had many years, of personal experience, and it is our wish that our readers may avail themselves of the advantages to be derived both from our failures and from our success.

Our first attempt to raise English grass on a low peat meadow was in 1826. Three of us joined together in the purchase of eight acres of peat land lying in the centre of the town of Framingham. Major B. Wheeler and John Ballard, 2d. were our partners in the purchase.

When we first made known our purchase and our object we were laughed to scorn by many of the inhabitants. We forgive every one of them, for they have since confessed their error, and are ever ready to applaud the advances we have made in cultivation. They were not then aware of the mischiefs they caused us by their want of faith—it was almost impossible to procure help to labor on this meadow—people require extra wages while laboring here, and when enquired of where they had been at work, they were studious to conceal the scene of their operations. Fortunately, the purchasers were all skilled in the use of the bog-hoe and of the paring-plough, and by taking hold and setting the example, others were at length induced to join them and "to dig on old centre meadow," because much less unpopular, after one summer's than

We well remember an expression of one of the oldest inhabitants, J. Maynard, Esq., on this subject. He said he did not wish to live any longer after he should see one ton of good English hay grow on old centre meadow. He did live many years after. At a meeting of the trustees of Framingham Academy which stood on the border of this meadow, Doctor D. Kellogg, Rev. Mr. Packard, and J. Maynard, Esq. were present. Doctor Packard looked out on the old meadow, and seeing it flooded, enquired if it was *dammed*. "Yes," said Maynard, "and it always has been ever since I knew it."

This meadow was so miry in the centre that we could easily sink a rail eleven feet long, endwise out of sight. Our first business was to drain off the water. We drained it off one foot and a half below the surface. We then commenced the paring and burning system. This paring is performed by hoes—sometimes assisted by a paring plough. When the meadow will bear up oxen, a paring plough facilitates the operation. Such a plough has a wide share—say one foot and a half—which branches out in a wing on each side. It has no mould plate, and does not turn the furrow over. It only cuts the turf in slips, and suffers it to lie to bear the team up; then, with the hoes, the sods are easily turned over to dry. When the paring plough is in good order, one yoke of oxen will draw it through a strong haddock. The plough has a sharp coulter like that of an old fashioned wooden plough, and much resembles one except in the want of a mould plate, and in the addition of a second wing to the sharp, branching out to the left, or land side.

In a dry summer, the turf thus turned over will soon burn if fire is applied. It burns much better the first summer than if allowed to lie a year on the ground. It is well to commence paring and burning in June, for then we have the summer before us, and can choose the driest time for burning. When some of the sods are well on fire they may be heaped together, and others not so dry may be piled on till the heap becomes as large as a hundred of hay. When thus piled no small rains will quench the fires, and they will often burn for days of rainy weather.

Sometimes we are enabled to burn the sods as they lie, when no rain comes for ten days in succession. Then all the labor of piling and of spreading about the ashes is saved. This is the easiest mode of preparing for the grass seed, but we are not always able to burn the sods thus.

When the heaps are burnt, nothing remains to be done but to spread the ashes, sow the seed, and rake it in with a common hand rake. This should be done early in September, if we expect a good sward of grass the next summer—but any time in September will answer for sowing these low meadows with herds grass and with red top. We have seldom seen these grasses winter-killed on these peat bottoms.

When we are unable to burn all the turf by the middle of September, we spread the ashes over the whole surface, after having raked the unburnt sods in a new place, and we let these piles stand in shape of haycocks until another summer. They then will sometimes burn wholly down without any trouble, and their ashes should be spread on to the grass ground, and a little seed should be sown on the ground where the heaps stood.

In this mode, meadows may sometimes be pre-

acre. It sometimes costs thirty dollars. One advantage in this mode of reclaiming meadows is, we have manure enough in the peat ashes for two or three years, and we sometimes cut two tons to the acre without any other dressing. It cost us more than twenty dollars to subdue an acre of this meadow, for we were beginners and had no instruction. We sold about four acres of this reclaimed meadow to Dr O. Dean, at two hundred dollars an acre. Such lands must have a new dressing once in a few years, and if compost manure is carried on, it should consist, in part of gravel. This being far preferable to sand. Not more than one peck of herds grass (timothy) should be sown on an acre, for the seed will all grow, and when it is sown thicker it sometimes come up and mats together so close, as to check a thrifty growth. These bottoms become harder as the grass grows, and we are often able in a few years to plough them and turn the wild grass under and seed them down anew, as we do higher lands. We intend, in a future number, to show how we have subdued peat meadows by different processes.

In general, when gravel, or loam, or both are not nigh by, paring and burning are cheaper than any other mode.—*Genesee Farmer.*

AGRICULTURAL GLEANINGS.

The papers, in very many sections of our extended country, contain most cheering accounts, both of the quantity and quality of the forthcoming reward of the labor and care of the husbandman. We extract a few of the principal for the gratification of our readers.

The Carbondale (Luzerne county) Journal states, in reference to its neighborhood:—"We are on the eve, if all signs are to be credited, of a most abundant summer harvest. There are local exceptions, as there must ever be, but the general prospect is excellent. Should the season continue propitious to its close, without serious blight, rust, mildew, or frost, we believe that an aggregate harvest, at least twenty per cent. greater than ever,

promise. That arch enemy of the farmer, the army worm, has been at its destructive work in Missouri and Illinois, as we learn from the two journals quoted below.

The St. Louis Republican states that, on many of the farms in St. Louis county, and its neighborhood, hardly a vestige remains of wheat, oats, or corn, which but a few days before, promised fair to reward the farmers for all their labors. They are equally destructive to meadows.

The Columbus (Illinois) Herald asserts that this direful plague is at work in every direction thereabouts, and is exceedingly destructive. In Illinois, late very heavy rains have been productive of very serious consequences. This fact we gather from the statement of the "Backwoodsman," which informs us that, at Grafton, the quantity of water that has fallen is greater than ever before known in so short a time, at this season of the year. The smaller streams are overflowed, and in many places the bottom lands adjoining are inundated. It is feared that many bridges are swept away, and some of the farmers sustained serious damages. One had a field of corn, containing twelve or fourteen acres, entirely destroyed. The corn was literally washed out of the ground.

Per contra, in Georgia and Florida, they complain, and with reason, we regret to say, of drought.

The Milledgeville (Georgia) Journal says—"Without there is an early rain, the planters in this vicinity will lose their crop of corn, and the cotton will be materially injured." And the Tallahassee (Florida) Gazette declares that the drought had been greater than for several years; and that unless rain should come speedily, the corn would be "ruined." Thus far, however, the cotton in that quarter looked well.

At Cincinnati, on the 18th, Flour had fallen to \$5.00; and but little doing. Wheat had fallen 20 cents per bushel, and was then plenty and dull at 90 cents, with the expectation of a further decline. Although large supplies of Corn had been received from Illinois, prices ranged from 70 to 80

cents and predictions have been remarkably correct, I can see I was very much mistaken with regard to prices of flour at this time. I had anticipated a great fall ere long, knowing well that almost all other crops were abandoned to make room for wheat; but with some exportations and no importations, I did not dream of a fall until after next crop; but I see I am mistaken. Oats are here worth from 5s to 6s per bushel, and wheat cannot be worth over 9s, according to the price of flour in your market, which plainly shows that wheat was raised in place of oats. Provided our wheat ripen regularly and in good season, you may rely on having a large quantity from Western New York, and you may tell the Millers to take care how they buy else they will ruin themselves outright. I shall write you about the commencement of harvest; then we can tell to a certainty what the crops are. At present it is only guess work, but the chance was never more promising. We have a good demand for wool; prices range from 37 to 56 1-4 cents per lb. Sheep and cattle very high, especially cattle. Cows from \$35 to \$50 each. A FARMER.

AGRICULTURAL MEETINGS.—It is as important to the country that agriculture should be scientifically understood and studied, as that manufacturing science should progress. The mere culture of the land is nothing, except it is conducted on the best possible principles. To plough and manure, to sow and reap, to break up and lay down land, to breed and to rear stock, and to farm and to labor on a farm, merely as they who have passed away did, is no great merit. This is merely to exercise an imitative talent. The resources of the mind ought to be brought to the labor; and profiting not only by experience but in learning by experiment, we may hope to see improvement progress in an equal ratio in agriculture as in mechanics; and the knowledge that the stores of experimental philosophy affords to be applied to this, the most useful of all arts because it produces the raw material

(From the Buffalo Advertiser and Journal.)

FLOUR SPECULATORS AND THE BANKS.

"Well, the flour speculators will have to sweat, any way," was a remark we heard in the street yesterday, and the saying, though rather vulgar in its phraseology, embodies an idea that is pretty generally entertained. Flour is going down, a great deal of last year's crop of wheat is yet in the hands of the producers, and the growing crop looks exceedingly well. A still greater decline must therefore be expected, and as our unknown friend said, "the flour speculators will have to sweat." There is no class of business men for whose sufferings and losses less commiseration will be felt by the public at large. Speculators upon the necessities of life, have in all ages and countries been denounced, and now, when there is a prospect that they, who have fattened and waxed rich, when their neighbors and fellow-citizens were sunk in the deepest embarrassment, are about to suffer in their turn, there is a feeling of general exultation. How far this feeling is correct, we will not now stop to examine. Popular feelings and opinions, most usually, are made up of equal parts of truth and error, and those we have alluded to do not probably form an exception to the rule.

For some years back there have been confessedly short crops; the price of flour accordingly rose in a corresponding proportion. The rise was legitimate, and no one had any reason to complain of it. But coupled with the short crops and the enhanced price of flour, was a spirit of speculation which had overspread the land. It was universal. There was a general distaste for the pursuit of steady industry and its slow gains, and many of the more cautious business men, who had been affected by it, and who doubted the ultimate profits to be made from land speculations, went into the manufacture of flour. Few in our country have capital of their own, sufficient to carry on the business. The Banks are therefore resorted to, and for the last five years the means of those institutions, particularly in the western part of this State, and northern and central Ohio, have been almost monopolized by the millers. The Banks have been severely censured for granting to a few men of a single class, large facilities and accommodations, while the mechanic, merchant and farmer in their immediate neighborhood, and for whose benefit they supposed the banks were created could not get a dollar. But the banks, like individuals, will generally do what is most for their interest; and in ordinary times the banks can make more money by lending to the millers than by other class. The business, as a general thing, is pretty safe. The millers give the notes of the banks an extensive circulation in regions of country where they are not likely to return immediately—they get quick returns on their investments, and by sending their flour to New York are able to place funds precisely where the banks want them. If large immediate profits are their object, they can't do better than lend to the millers; but like all who are greedy and avaricious, they are liable at times to overreach themselves, and the great losses they are forced occasionally to sustain, render it questionable whether in the long run they would not find it more to their interest to confine their business to the regular legitimate channel.

But we intended, when we commenced, simply to remark upon the relative situation of the flour

prices, as we have above said, is downward, and some of the banks are getting rather fidgety about the security of their large loans, and beginning to press for payment. Every miller who is unquestionably solvent and able to meet his engagements, will soon be required to pay up at whatever sacrifice he may be obliged to make. Like the season of 1832, so well remembered by many in Western New York, it is not unlikely that some, who by a little delay could make their arrangements and ride out the storm in safety, will now go by the board, or be severely crippled, by their anxiety to meet all their engagements honorably.—The miller who is deeply and almost hopelessly in, is about the only one who is perfectly safe.

The banks are forced to sustain him on the principle of self-preservation, and this is one of the greatest evils of the connection between banks and millers. Milling is like learning in one respect—a man must drink "deep or taste not," if he proposes to carry on the business by the aid of bank accommodations; and there are now in western N. York, men of undoubted wealth who owe their good fortune in a great measure to the fact that they were so deeply embarrassed in 1832.

It may be asked what will be the effect of this state of things upon the community? We answer good. Flour must fall, and by so much will the community be benefited. But in addition to this reduction in price of one of the most important necessities of life, some of the banks will narrowly escape burning their fingers, and taught by the lesson a salutary caution, and by the payments of the millers having more means at command, they will be able and willing to give greater facilities and accommodations to the public generally.

THE DANGER OF BETTING.—Some weeks since, a clerk of a market near our city, looked into the butter tub of a market man, and thought he discovered a small deficiency in the size of lumps. Whereupon he brought forth his balances, with an air of justice, and proceeded to weigh the whole by parcels. Every lump was short of weight. So that thirty pounds of butter (less the illegal deficiency in each lump) was confiscated.

A week or two afterwards, the clerk, in the faithful discharge of his duty, stopped at a butter tub, and tried a pound in his scale.—it was correct; he tried another and another. At length the owner said—"You need not trouble yourself—you will find all of my butter correct." The clerk looked up, and discovered his old friend of the light lumps. "Perhaps I shall," said he—"but if I am not mistaken, I took thirty pounds from you a week since."

"It was not from me."

"It was—I know you."

"I will bet five dollars you never took thirty pounds of butter from me, at any one time."

"Done."

The money was staked—and the clerk told his story. It looked blue for the countryman.

"I admit the loss of thirty lumps of butter," said he, "but to have been thirty pounds, there must have been a pound in each lump." "Now, either the clerk did me injustice by confiscating my butter for unlawful weight, and I may claim back of him thirty pounds, at 25 cents per pound, which is \$7 50; or he did not take thirty pounds, and I may claim my bet of five dollars. The clerk gave up the bet.

Next, Make a light brown of butter, and so

NEW ENGLAND FARMER,
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JULY 10, 1839.

COMMENCEMENT OF A NEW VOLUME OF
THE N. E. FARMER.

It would seem ungrateful to commence a new volume of the New England Farmer, without offering our acknowledgments to our subscribers and correspondents for the aid, indulgence, and kindness, which we have received from them. We trust their kindness will prove a stimulus to greater exertions to render the paper worthy of the increasing patronage which it receives.

The New England Farmer has now been five years in its teens. We well remember when it first saw the light, and when the child was born the goodies and the gossips every where predicted that it would never live to grow up; but its devoted and lamented editor, who acted in the double capacity of midwife and nurse, soon imparted a vigor and activity to its constitution, which have brought it thus far forward; and leaves little room to doubt that it will attain the usual longevity of such a periodical. Its firmness and invariable good health are doubtless in the main attributable to the skill and care already referred to; for its protector was careful never to admit into its stomach any thing, which might disorder its digestion; and though always ready to prescribe all sorts of reepes and nostrums for others, was like most other wise physicians, altogether averse to using his own medicines in his own family, and careful to supply only the most simple and substantial food. While we have the honor in any measure of its guardianship, or are in any case called upon to prescribe for it, we shall in this matter, though with unequal steps, attempt to follow in the path of our revered predecessor.

To drop all figure however, it is our desire and purpose to make the N. E. Farmer, as far as possible, a vehicle of useful information and instruction to our brother farmers; to stimulate them to new efforts and enterprises, for the benefit of their great art; and to contribute, in the humble form in which we are permitted to labor, to swell the impulse by which this most important of all purely secular pursuits is now urged onward in the convictions of far-seeing minds and the affections of public-spirited hearts. We are happy in the belief that our labors have done something towards increasing the public interest in this subject; and however imperfect the judgment and ability with which they have been rendered, we have at least the invaluable consciousness of honest purposes, and unflinching zeal.

The preparation of a weekly sheet of the size of the N. E. Farmer, excluding in a great measure advertisements, and restricted in the choice of subjects, is no easy task. It would be an infinitely easier undertaking, if more variety, or miscellaneous matter were allowed, and perhaps quite as useful; but we hold to constitutional pledges, and as the Farmer is understood to be exclusively agricultural, excepting the last page, we shall not break the bond, though we are inclined to the belief that most of our readers would prefer a liberal interpretation of it. There is indeed among our constant readers, but not among our subscribers, once in a while a scowler, whom we despair of always pleasing. Such persons the dinner never suits; there are too many or too few dishes; there is too little or too much seasoning; they want boiled when we have nothing but roast, or they want a ragout or a fricasee when we have nothing but a plain joint. They complain that we do not give them melons in January and peaches in all the other months. We should be

the Farmer; but in the exercise of an honest judgment, a right which they may be sure we shall under no circumstances surrender, we may fail to do this; and under this inability or misfortune, we can only recommend to these generous patrons to borrow some other paper.

Agriculture in its largest extent, is a matter of such general and universal interest, entering in its ramified relations into all the business and arts of life, and lying at the very foundation of human society, that it would be difficult to touch upon any human topic, which has not a near or remote, a direct or indirect relation to it. Man himself, having been first formed out of the dust of the earth, may be considered as a kind of agricultural production, and every thing therefore, relating to his culture and perfection, may, with a show of reason, come under the general topic. One of our own poets has beautifully said, that "man is the noblest growth our realms supply," and higher authority speaks of him as the flower of the field, and as perishing like the new mown grass. But honestly as we might, we shall not avail ourselves of this general license; and will not venture into fields understood to be forbidden, though there is no fence round them; but will respect the right of property and travel as quietly as we can along the King's highway. In doing this, we express our humble hope that our own rights may be protected; and that the gate may not be opened and the dog set upon us simply because we look over the fence or merely peep through a knot hole into cultivated or neglected fields.

We were pained to hear that even in our last number some of our good friends were disturbed, because, without even going skin deep, and much less with any thought of bringing blood, we touched the reverend clergy, with the point of a fine cambric needle; though they would not hesitate to knock a poor farmer over with a bludgeon (we mean figuratively of course) if on a hot Sunday afternoon in July, after a week's haying, he should happen to feel a "lecter" drowsy under some nice hair-splitting division of the text, or some one of the five or six "finals, and to concludes" of the discourse. But how we could be suspected of any ill-design toward our own brethren we cannot divine. We will offer all the amends in our power;

and we shall say nothing of a living friend, who by his intelligence, his practical skill, and his public spirited exertions has conferred most distinguished benefits upon the agriculture of the Old Colony.

But the clergy everywhere have a direct interest in agriculture. How are we to have praying and preaching without bread and beef? Even our good friends Graham and Alcott, with their most sublimated philosophy, would lose their wind if the plough should stop. The better the preaching and the better the praying the more and the better the bread and the beef. Good husbandry promotes good morals; and if good morals be in the opinion of any no part of religion, they certainly are a most wholesome foundation for religious institutions and enterprises. The clergy then have a particular interest in the improvement of agriculture. We do not think their hands would be incurably soiled if they should sometimes handle a hoe; nor would they lose their uprightness by standing behind a plough. We think likewise they would find continually new stimulants and strong encouragements to ministerial labor if they themselves more frequently cast the seed into the ground, and saw that when the land was well prepared and enriched and the tender and growing plants carefully tended and watched over, and man faithfully performed his part, Divine Providence does not fail to give its sunshine and rain and mature the harvest.

We must therefore urge upon our friends the clergy, to take an interest in agriculture. We wish them for their own sakes to go upon the land; it will be conducive to physical and therefore mental health; and then we wish them to give us the results of their intelligent experience; and this will be for the health of the Farmer and of the agricultural community at large.

We shall persevere in our labors to be useful in this department. We cannot make any farther promises, and can give the past only as a pledge of the future. We have various competitors in the field, but the field is wide enough for us all, and we begrudge no man his honest success. We shall run no tilt with any man, and shall give the road to any impatient man who chooses to force himself by us even at the risk of overturning his own vehicle; and in meeting, we are determined,

By E. Weston, jr., Esq. and F. Parker: *Epilobium angustifolium*, *Sambucus Canadensis*, *Rhododendron maximum*, *Lilium Philadelphicum*, *Aster miser*, *Galeopsis Tetrahit*, *Convolvulus sepium*, *Prinos verticillatus*, *Pyrola rotundifolium*, *Calla Virginica*, *Holcus lanatus*, *Cornus alba*, *Hieracium venosum*.

For the Committee, S. WALKER, *Chairman*.

THE Premiums on *Carnations* will be awarded on Saturday next, 13th inst., viz.; For the best display \$5; for the best six varieties \$3; for the best seedling \$3. Per order of the Committee on Flowers.

S. WALKER, *Chairman*.

EXHIBITION OF FRUITS.

Handsome specimens of the White Antwerp Raspberries from Mr T. Mason, Charlestown.

From Mr S. Downer, Dorchester; White Tartarian Cherries of the London Hort. Soc. catalogue, 200; and Downer's Red Heart Cherries.

From E. Vose, Dorchester; True English Black Heart and White Bigarreau Cherries, of the London Hort Soc. catalogue, 15.

From Mr B. V. French, Braintree, Elton cherries, of the London Hort. Soc. catalogue 79.

From Mr J. M. Ives, Salem, Mottled Bigarreau, a seedling.

From Mr R. Manning, Salem; Bigarreau Cherries, of the London Hort. Soc. catalogue Nos. 15 and 20.

From Mr O. Johnson, Lynn; a handsome specimen of the Zinfandel grapes, finely colored.

From Messrs Hovey & Co. Cambridgeport, seedling strawberries. This specimen was more excellent than any exhibited by them before, and was the 8th box picked from 12 plants set out in 1838, in a bed of 2 1-2 by 10 feet. The specimens of cherries were all excellent, and the show of fruits to-day was superior to any we have had this season.

For the Committee, B. V. FRENCH.

Exhibition of Fruits June 29. From Mr Vose, the President of the Society, Black Tartarian Cherries, Medlen Castle and Wood Strawberries.

From Mr J. L. L. F. Warren, Amber Heart or Belle

MISCELLANEOUS.

We give place to the subjoined with pleasure, and like poor Oliver Twist, we hold out our plate for more. It is the production of a charming friend, who has youth, talents, beauty, and much higher adornments of the heart and character to make this world delightful. It was evidently written some cold stormy evening of winter, when she sat shivering with her feet between the andirons, and the fire burning very blue. It has no affinity with this delightful season of fruits and flowers, of green fields and waving harvests, and fragrant zephyrs. But we give it that the contrast may throw at least some light upon the darkly shaded picture which she has conjured up to her imagination. Human life we know has much in it of vanity and vexation of spirit; but old age is not always a season of regret and sorrow, of sickness and pain. Then there is the hope that comes to all, that so often fringes the setting sun with an ineffable beauty and splendor. H. C.

ME ERROR.—Should I help you lecture the "world's people" for their ardent devotion to the "Money God"?—By way of beguiling a winter evening, I turned my thoughts on the subject into rhyme—if my self-esteem was very large, I should say poetry. They are at your service if you want something to help fill up one of the extra pages you promise, but pray do not crowd out anything that has value in it.

Your friend,

We toil,—and still toil on—

To eather wealth and we,

Not thank how soon the wealth may fly;

That we will never go.

If for eternity

We thought to gather gold,

If countless years of happiness

That treasure could unfold,

Not harder should we strive

To heap the glittering dross,

Counting all time spent otherwise

A serious, certain loss.

And thus we delve in youth,

And thus through manhood's prime,

Hoping in age to reap the fruit

Of all this wasted time.—

But when the years arrive

To which we've looked for rest,

And when we just begin to think

Our labors will be less;

Come sickness, pain and age,—

Comes all the mournful train

Of wasted days, and ill-spent hours,

Careering through the brain

On memory's fleet wings,

To sadden all our joy,

And mix our golden happiness

With misery's alloy.

HOW TO BE RICH.

"The way to get credit is to be punctual; to way to preserve it is not to use it too much. Settle often; have short accounts."

Trust to no man's appearances—they are deceptive—perhaps assumed for the purpose of obtaining credit. Beware of a gaudy exterior. Rogues usually dress well. The rich are plain men. Trust him, if any one, who carries little upon his back. Never trust him who flies into a passion on being dunned; make him pay quickly if there be any virtue in law.

Beware of him who is an office seeker; men do not usually want office when they have any thing else to do. A man's affairs are rather low when he seeks for support. Trust no stranger; your goods are better than double charges. What is character worth, if you make it cheap by crediting

all alike? Agree beforehand with every man about to do a job, and, if large put it in writing; if any decline this, quit or be cheated. Though you want a job ever so much, make all sure at the outset; and in a case at all doubtful, make sure of a guarantee. Be not afraid to ask it, it is the best test of responsibility; for if offence be taken, you have escaped a loss. If he be in fact responsible, he will like you the better, for he thus knows that he is dealing with a man who looks at the end of things and only expects to be well served. If not, he will be provoked, and discharge you instantly. Thus you have it in power always to protect yourself in any doubtful case, by simply insisting on security. "Once well begun, it is twice done."

No, is a very useful word—be not afraid to use it. Many a man has pined in misery for years, by not having courage to pronounce that little monosyllable.

Work for a man that is punctual at less wages than for him who is not; you get the balance in certainty of payment. One dollar size, is better than two doubtful; and it will avail more upon a shift. If you cannot get full wages, take less; better do so than to be idle.

Shun idleness. A shilling a day is better than nothing. The very act of being at work will procure employ, by and by, at a fair rate. Men avoid him who is always strolling about the streets; he is judged unfit for any thing, and may die for want of employ.

If you can find nothing else to do, read and improve your mind, and fit yourself for better doing what you may have to do. Instruct your children; see that they have good schools, visit them occasionally, and take a glance at the method in which it is conducted. Do you think they will ever respect you, or be worth having, if you neglect them in their youth, when the mind first takes its bent and inclination? No man who has a family should ever say that he has nothing to do. Dr. Franklin once lived upon fifty dollars a year, including all expenses. One may, in this country, carry himself well through with less money.

Stroll not about begging patronage:—What is patronage?

Nothing after your ability is known. Then, if you are fit for employ, you will have it—if not, a better man should. You must stand competition; this is the life of business; get work by superior skill, punctuality and attention. Men know their interest, and will follow it in spite of friendship. Give me the skill, and you may have all the patrons. They will stick to you as long as you serve them best—no longer. If too many are in business, let the balance clear out, and they will soon do so, if the public do not falsely cherish them with fair words of patronage, which mean nothing:—"but every man for himself."

Recollect the main point is employ, and not fair words. One man giving a job is worth forty promising it,—promises are the ruin of many, and usually impart nothing but a vitality to hope. Many a man promises for mere good nature, and will wantonly promise the same thing to a hundred a day, and disappoint ninety-nine. Doubt every man who has not strictly complied with engagements. If he has disappointed others he may disappoint you. In fine, never think you have money at your command, until it is actually in your hand; and therefore take care how you promise it. Neglect of such prudentials hinders men from becoming rich, and produces hard times.

Tulips, Ranunculuses, Anemones, Auriculas, Carnations, Picotees, Pinks and Geraniums

H. GROOM, of Waltham, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in the cultivation of this season, he can offer at very moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the nice selections in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names.

	First Class.
A bed of 30 rows containing 210 bulbs including several of the newest varieties,	£15
A bed of 45 rows,	£21
A bed of 60 rows,	25 guineas

Second Class.

A bed of 30 rows including many fine sorts,	£10
A bed of 45 rows	£14
A bed of 60 rows	£17 10s

Tulips not arranged.

100 Superfine sorts with their names from	£7 7s to £13
Superfine mixtures, from	7s 6d to 21s

Ranunculuses.

100 Superfine sorts, with their names from	£3 3s to £5 5s
Superfine mixtures, from	5s to 21s per 100

Anemones.

100 Superfine sorts with their names,	£3 10s
Superfine double mixtures from	10s 6d to 21s per 100

Auriculas.

25 Superfine sorts with their names,	£3 13s 6d
--------------------------------------	-----------

Catalogues, with the prices of the other articles may be had on application.

Orders received by **JOSEPH BRECK & CO.**
New York.

MULBERRY FOLIAGE.

Quantities of Mulberry Leaves for feeding Silk Worms, may be had by application, personally or by mail to WINSHIP'S Establishment, or to **JOSEPH BRECK & CO.** 52 North Market Street, Boston. Brighton, June 17.

CORN SHELLERS.

Just received at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, a supply of Currier's Patent Corn Shellers; a very convenient and cheap article. A right to using and machines in counties or towns may be obtained by applying as above.

17 SCHOOL STREET.—BOSTON.

Letters on Education of Farmers.—We have just received the *Cleveland Herald* containing six essays of Mr Holtbrook, referred to in the *Farmer* recently, on the subject of the education of farmers. He is desirous that they should be published in the *N. E. Farmer*, and we are happy in the opportunity. In the views generally, we entirely concur. The essays are full of sound, practical, good sense; and show the farmers the immense good which is within their reach. They consist of six essays which we shall give in successive papers, and shall be extremely happy to hear again and often from Mr Holtbrook, and to second in any way according to the measure of our humble ability, his public-spirited plans for popular education. H. C.

EDUCATION OF FARMERS—No. 1.

MR HARRIS—I have concluded to avail myself of your politeness, for presenting to the public a few practical hints on the education of farmers.—The fact that more than three-fourths of the community belong to this class, identifies with their character and influence, the happiness and the liberties of our country. It is evident that our republic must be, both in its character and destiny, what they make it, and what they say it shall be. I propose, in several short essays, to invite the attention of your readers, and especially those directly concerned in the ease, to the physical, intellectual and moral power of farmers, and to give a few hints on the kind of education necessary to increase and direct that power, for the highest prosperity and for the liberties, not only of themselves, but of every other class of American citizens.

In the few remarks I have to make on the subject, I shall attempt to sustain the following propositions. First, that a greater amount of really useful knowledge is, at present, in the possession of farmers, than of any other class of the community. Second, that neither merchants, nor lawyers, nor physicians, nor clergymen, nor professors of colleges, possess so many facilities, or so many inducements

convictions will be produced by the same force upon other minds, if the subject should be carefully and candidly examined by them.

It is too evident that the operations of our republic, political, civil and religious, are subject to great irregularities, and even violence, and of course that some better balance wheel or regulator, than we now have, is necessary to equalize if not to continue their motions. Education has been sought, and professedly applied, for the purpose of regulating and continuing these motions; but in that there is evidently so far, some defect—probably two defects of radical character, viz: education is not general enough, and it is not good enough. It does not reach every plain farmer's son and every poor mechanic's daughter; it also wants a soul, or moral principle, as the foundation stone, or the central and main wheel of motion, of all motions, whether applied to state, church, or common business.

And it may fairly be questioned, whether some of the measures to remove these defects, have not increased them. It is exceedingly doubtful whether our numerous colleges and high schools, established at great expense, and to some extent at least by the people's money, and still incurring an expense too great for the people generally to participate in their instructions, have not produced an aristocracy of learning, (I do not mean useful knowledge,) which has unfitted young men for the industrious and productive pursuits of life, and thus lead them into professions or pursuits calculated to increase rather than relieve the burthens of society. Whatever else many of our literary institutions may be called, they cannot be called schools of industry, morals, health, or a knowledge of business; for with many young men, not to say young women, who resort to these institutions, all these valuable qualities are laid prostrate.

Is there any remedy for these evils? or must all be given up for lost? If it can be shown that farmers—*every* farmer—can with scarcely going

useful knowledge, which is probably much oftener repeated than understood. It may be seriously questioned, whether, with many, the attention devoted, and the value attached to subjects of learning, are not nearly in proportion to their uselessness. In a college course, for example, embracing the preparatory studies, and occupying in the whole, from six to eight or ten years, much the greatest portion of the time is devoted to the dead languages and the abstractions of mathematics, and furnishing to many of their pupils a very meagre smattering of many even of these. How far a knowledge of the Latin and Greek languages, or of the terms used by the Greeks and Romans to express their ideas about their heathen gods, wars, bacchanalian feasts, and many other subjects as little connected with the pursuits or duties of American citizens, may properly be considered useful knowledge, is the question; and whether the three or five years devoted to these languages in a college course, might not produce a greater amount of knowledge, more really useful, if employed upon some other subjects. The rights and duties of republican citizens, secured and implied by our constitution and laws, the reciprocal interests, and the relations existing between different classes of citizens, between the employer and employed, master and apprentice, farmer, mechanic and merchant, men and women, husband and wife, parent and child; also between the different members, or states of our republic, embracing all the fundamental principles of political economy; the physical sciences, embracing the fundamental laws of chemical, and other branches of natural philosophy, animal and vegetable physiology, especially of the human system, also geology, mineralogy and botany, with a particular application of the whole to agriculture and the mechanic arts; and above all, the relations subsisting between the creature and his Creator, and the duties arising from these relations, so clearly, fully, and beautifully developed in the volume of inspiration and from natural religion; a familiar,

my knowledge respecting the vegetable kingdom, and respecting American trees it is the only work of my acquaintance of much value. But that is valuable and interesting to every farmer, and every mechanic, and even to a general reader.

But where did they obtain the materials for their work? Was it from the graduates or professors or presidents of colleges? Not a particle; and very little from any American botanist. Much the greatest and most valuable part of the materials for these very useful volumes, were obtained of this ship builder, that carpenter, and another cabinet maker, or some other mechanic, and a large portion from farmers.

I will suppose a case on the same subject; a case too, of which many thousands actually exist in our own country. Suppose that a scholar, in his five years thumbing his Latin and Greek dictionaries, learns that what we call oak, the Romans called *quercus*, and that the Greeks called the same thing *δρυσ*. But if an oak and maple tree were shown to him he could not tell one from the other, or the name or properties of either. Show the same things to an unpretending farmer, and he could inform you that the one was white oak, or black, grey, red or Spanish oak; also of its growth, strength, durability, &c., and of its various uses founded upon its properties. The case is of course, that the scholar has three terms, but not one idea; the farmer has one or two terms with various ideas connected with each. Here is a learned scholar and an ignorant farmer, but which is the man of knowledge? As the same illustration will apply to hundreds of other subjects as well as botany, whose ideas are most extended?

The occasion does not permit of an extended view or a variety of illustrations of the subject. I must therefore leave it for the present, with the question, *Which have the greatest amount of useful knowledge, farmers or professed scholars?* If any should think the latter, I have only to add, that he differs from me in opinion.

With the kind regards of

Your Friend,

J. HOLBROOK.

[From the Genesee Farmer.]

HILLING PLANTS.

MR TUCKER—I have seen in the columns of the Farmer, and the Cultivator, considerable written on the subject of hilling plants, particularly potatoes and corn, and the conclusion to which the writers have generally arrived, seems to have been that the practice was injudicious, and should be abandoned. To this conclusion I give my assent, so far as corn is concerned; as from the nature of the system of roots, and the manner in which the *braces* are thrown out, it is clear that hilling, by covering the first crop of these upper roots, and starting new ones, exhausts the plants needlessly, as but one set of brace roots are essential to the plants. But unless I am much mistaken, the case is different with the potato. In this plant, as every one who has paid attention to it knows, the tuber, or valuable part, does not grow on the root proper, but on shoots protruded from the stalk of the plant, beneath the surface of the earth. To produce good potatoes, and a large crop, the putting forth of these shoots should be encouraged as much as possible; and no way seems so likely to produce this effect, as providing

a supply of light fresh earth around the stem, and renewing it as occasion may require. In my opinion, the experience of our best potato growers is in accordance with these facts; certainly my own would go most conclusively to show that the more ample the supply of light, rich, penetrable earth, furnished the plants, the better usually would be the crop. But it also follows, from my view of the matter, that the greatest care should be exercised, not to disturb any of the first formed shoots, by subsequent earthing; a point to which too little attention is paid in ploughing and hoeing this plant. I have noticed that in potato plants grown in hard land, or that were not properly hood and furnished with a supply of loose earth for the shoots, that they were short and diminutive, the tubers crowded, and usually inferior. A potato crowded out of the ground, and exposed to the air in growing, is good for nothing; and where hilling is not practised, more or less will be in this predicament, if the crop is anything like a fair one. You will, therefore, permit me, for the reasons given above, to question the propriety of *not* earthing potatoes, though the observance of hilling can well be dispensed with in the culture of corn. PLANTER.

THE PERFUME OF PLANTS DELETERIOUS IN CONFINED APARTMENTS.—It is not sufficiently known by the admirers of flowers, that the agreeable perfume they emit, when in full bloom, is decidedly deleterious when diffused through close apartments, producing headache, giddiness, and other affections of the brain. But it is only in confined rooms that such effects are produced. In the garden, when mingled with a wholesome and exhilarating atmosphere, amidst objects that awaken the most delightful sensations of our nature, these sweets are a part of our gratifications, and health is promoted as a consequence of our enjoyment. Who has not felt the excitement of spring? of nature in that delightful season, rising from lethargy into beauty and vivacity; and spreading the sweets of the primrose and the violet for our gratification? Amidst the beauties of the flower garden, these pleasures are condensed and refined; and the fragrance there hovering on the wings of the breeze, is not only pleasant but wholesome. Whatever increases our gratifications, so peculiarly unmixing with the bad passions of human nature, must surely tend to the improvement of mankind, and to the excitement of grateful feelings towards that beneficent Creator who has so bountifully supplied us with these delightful luxuries.—*N. Y. Sun.*

SHEEP SHEARING in Nantucket is an annual jubilee. The "wool gathering" of the present season is thus noticed by the Nantucket Inquirer.

"The Carnival has commenced. The orgies of the nutton-worshippers are beginning to burst forth, and all the woolly world is in an agony and a catastrophe of helter-skelterishness. The mill-hills skip like rams, and the lambs look like young lambs; and the sheer-pee rageth and foameth as they were a sea of living fleece—not fleas—bah! Four legged creatures of all practicable sorts—and one, two, three, and four wheeled vehicles of all supposable shapes, are getting into a furious passion. The very cows' commons are in commotion. All around, the moving elements are head up and tail up—and the predominating cry is "cut-on-Dunnun," which meaneth. Go it Jerry! The whole country is bewitched: the sands thereof are

turning topsyturvy; and the grand design is to knock all creation into a Whoraw's nest!

Reader! didst ever bestrife a water-logged aper in the still dock—and spying in the oozy bed below a wriggling eel—didst ever clap thy thumb upon the serpent's tail with the hope of holding him thereby? Or didst ever think of detaining within thy grasp, by the aid of soft soap or other saponaceous unction, the like extremity of a swine or an alligator? Or hast ever undertaken, in any similar fashion, to catch a bumblebee or a devil-darningneedle? If *may* thou answerest, then dost thou know naught of the impossibilities of philosophy! Thine experimental acquaintance with the perplexities of existence, are as nothing and less than nothing, and thy wisdom not worth a brass baubee: for thou art but an abecedarian in the mysteries of potheration! But if thou *canst* comprehend these aforesaid difficulties, then wilt thou appreciate that tribulation which at this present time besetteth us, the publishers and printers hereof—viz: the revolt of all hands against laboring among types and ink during the Feast of the Nutton-Jubilee, which they profanely call the Patriarchal Jubilee. Consequence is, no paper next Saturday."

BRIGITON MARKET.—MONDAY, JULY 8, 1853.

Reported for the New England Farmer.

At Market, 290 Beef Cattle, 29 Cows and Calves, 2500 Sheep, and 280 Swine. 140 Swine have been before reported. 109 Beef Cattle unsold.

PRICES.—Beef Cattle.—We again reduce our quotations to conform to sales. First quality, \$8 75 a \$9 00. Second quality, \$8 25 a \$8 50. Third quality, \$7 00 a \$7 75.

Cows and Calves.—Sales "dull." We notice the following: \$30, \$42, \$50 and \$58.

Sheep and Lambs.—Lots \$2 25, \$2 50, \$3 75 and \$3 00. Weathers \$3 25, \$3 50, and \$3 75.

Swine.—Lots of large barrows at 7 1-2 and 8. A lot of small pigs at 7 and 8. At retail from 7 to 9. Small pigs 10.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brigton, Mass. in a shaded Northern exposure, week ending July 7.

TULIPS, RAMNCLUSSES, PINKS AND VIOLAS. S. WALKER of Roxbury, offers for sale in beds, or of such quantities as may suit purchasers, from 1 to 2500 bulbs of choice Tulips. The bulbs were imported from Holland, France and Britain, and to which yearly additions have and will continue to be made of the newest and choicest varieties. Persons wishing to purchase a bed of superb Tulips will do well to make a selection for themselves when the bulbs are in bloom, (about the 1st of June.) The prices will conform to the quality of the flowers selected, but in no case will the charge exceed the lowest market prices in the country when the bulbs were raised, and cheaper than the like quality can be imported.

Tulips in beds from 30 to 100 rows, containing from 210 to 700 bulbs, 6 by the dozen, 100 or 1000.

Viola grandiflora—Pansy, or Heartsease. Upwards of 2000 superb varieties will be exhibited and offered for sale when the Tulips are in bloom.

Ranunculuses—no mixtures, at from \$2 to \$5 per 100.

Pinks—fine hard varieties, from 25 cents to \$1 each. For particulars apply to S. WALKER, or to JOSEPH BRECK & CO. eow

SECOND EXHIBITION AT QUINCY HALL.

The MASSACHUSETTS CHARITABLE MECHANIC ASSOCIATION to announce to the public, that their Second Exhibition for the Encouragement of Manufacturers and the Mechanic Arts, will be held at Quincy Hall, in the city of Boston, commencing on Monday, September 23d of the present year.

The Officers and Trustees for the year 1870, having been vested by the Association with full powers to make the necessary arrangements, respectfully invite Manufacturers, Mechanics and Artists, the Ingenious and Scientific, to offer for Exhibition and Premium, articles in every department of Art, Science and Taste; choice specimens of native skill and ingenuity; rare and valuable domestic productions, natural and artificial; useful labor-saving machines; implements of husbandry, and new models of machinery in all their variety. In fine, every species of article for any useful or ornamental purpose, made of wood, stone, metal, or other material; the products of the loom in silk, cotton, wool, hemp, flax or hair; and articles devised by female ingenuity, or wrought with their industry, will have a proper place in the exhibition.

Medals (of Gold or Silver) or Diplomas, will be awarded to all articles of merit, deemed worthy of such distinction. The strictest impartiality and fairness will be observed in their distribution, and competent judges appointed, who in no case will be interested in articles exhibited.

At the Exhibition of 1837, which was kept open for ten days, and was visited by upwards of 70,000 persons, 15,000 articles were entered, nineteen Gold and one hundred and eighteen Silver Medals, and two hundred and seventy-five Diplomas were awarded.

Mechanics, Artisans, and Manufacturers, who may wish to present Machines, Models, or Goods, for Premium, are requested to address WILLIAM WASHBURN, Superintendent, or JOHN GORHAM ROGERS, Secretary, (post paid) which will meet with immediate attention, and every facility within the means of the Managers will be given to exhibit their several productions to the best advantage.

Articles intended for exhibition must be delivered to the Superintendent, at Quincy Hall, on or before Wednesday, September 19th.

Arrangements will be made to exhibit by steam power any working models that may be offered.

GEORGE DARRACOTT, President.

July 10.

Complete Garden and Horticultural Tool Chests,

From Sheffield, England; containing Garden Shears, improved Pruning Shears and Scissors, Pruning and Grafting Knives, Flower Gatherer, Garden, Dutch and Triangular Hoes, Saw, Spade, Weeding Hook, Garden Rake, Trowel, Hammer and Garden Reel; comprising every useful implement necessary for the cultivation of the Flower Garden. For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street

REVOLVING HORSE RAKE.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street.

July 10.

Marshall's Weeder, or Hand Cultivator.

This is a very useful article for going between vegetables, in order to keep down the weeds. A man, with one of these machines, will do more work than four or five with the hoe. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street.

July 10.

The subjoined account of the geology and agriculture of Wheatland, from J. Holbrook, Esq., and published in the Genesee Farmer, will be found highly interesting and deserving of particular attention. We are happy to transfer it to our columns.

H. C.

GEOLOGY AND AGRICULTURE OF WHEATLAND.

MR TRUCKER:—By a ride to Wheatland, and the politeness of its citizens, I was favored with a few facts which may be interesting to your readers. This town, situated in Monroe Co. N. Y. is on land known by the name of "Oak Openings," and considered by the first settlers of the neighboring towns of little or no value.

Five families of rocks are found here, namely, calcareous, gypseous, granite, hornblend and conglomerate. The calcareous, or lime rocks, are common limestone, secondary formation, calcareous sandstone, a mixture of lime and sand or silicious matter, calcareous shale, or a limestone slate, probably containing a portion of silex and alumina, calcareous tufa, perhaps hydraulic lime, or water cement, and occasional masses of coral.

Beds of gypsum are somewhat numerous, and of great value to the farmers, not only of this town, but of all others in the neighborhood. These beds, indicated by swellings or small elevations on the surface, are overlaid by calcareous shale, and underlain by limestone of a purer and more compact character. They are uniformly in a single rock, from 6 to 12 or 15 feet long, and from 3 to 7 or 8 wide, always thicker in the centre than at the edges, and wider in the middle than at the ends; or in the language of the owner of the beds I visited, they are shaped like a goose egg, a little flattened at two opposite sides. The quantity in a single bed, varies from 1 to 30 tons. The strata are horizontal, or nearly so, from 3 to 12 or 15 inches thick, compact, color brown, light grey and clouded, frequently interlaid with thin veins of fibrous gypsum, snow-white, with occasional masses of granular gypsum.

Various theories have been advanced respecting the formation of them and other ranges of gypsum, but as I was not there during its formation, and as I am not learned in theories, the only account I can give of that part of the subject is that *I do not know* how or when they were formed.

The granite rocks, like those of the hornblend and conglomerate families, appear to consist entirely of "boulders," or loose masses, probably stragglers from some other country, having taken passage perhaps upon ice cakes, at a time when this country was a portion of the bed of the Atlantic. Only two of the commonly recognised members of the granite family are found here, viz: granite and gneiss, little if any of the mica slate having ever visited this region, or taken residence here.

Of the hornblend family are found masses of hornblend, nearly pure, hornblend rock, or hornblend with a small portion of quartz and perhaps felspar, hornblend slate, sienite and greenstone.

Of the conglomerate family are sand stone and pudding stone, the latter apparently in small quantities.

Perhaps this town and the surrounding country to a considerable extent may properly be termed a gypseous region, as sulphur, one of the elements of sulphate of lime, or gypsum, appears to be diffused through the carbonate of lime, or common limestone, in considerable quantities.

Allen Creek, the principal stream in Wheatland, runs nearly through the centre of the town, and moves in four flour mills nineteen run of stones, four saw mills, three plaster mills, two stave machines and one woollen factory. The four plaster mills mentioned, with one on Mill Creek, grind annually about 4,000 tons of gypsum, which is sold at the mills at \$3 a ton.

A canal of 1 1/4 miles, cost \$14,000, and a railroad 8 miles, cost \$34,000, are provided by the citizens of this town, for their accommodation in business.

Wheatland contains about 18,000 acres of land, three-fourths of which are under cultivation, and about 5000 acres in wheat annually, averaging for the last ten years about 20 bushels to the acre, or 100,000 bushels for the whole town annually: for the ten years previous to the last ten, the average crop of wheat was not more than 15 bushels to the acre, and in some sections, not more than 8 or 10.

The two leading features in the agriculture of this place are wheat and clover culture, which frequently alternate with each other every other year; the wheat crops occupying the ground one year and clover the next.

In connection with the raising of wheat, which is the principal object of farmers here, and in a wide extent of country in this section of the state, wool growing forms an important item. It is a common opinion among farmers, in Wheatland particularly, that as many sheep can be kept upon a farm as acres of land cultivated, without injury, rather with benefit to the wheat crop. On some farms of 200 acres of cultivated land, are kept 250 sheep, or in that proportion, making as many sheep, as acres of land in the whole farm, embracing the wood land and all other not cultivated. Sheep are Merino and Saxony, with a few crosses of the Leicestershire and South Down: the merinos averaging from 3 to 4 lbs. annually on different farms, the crosses 6 or 7 lbs. not fine. About one fourth of the whole number of sheep fatted for the slaughter annually.

About 1600 fat hogs are sent to market annually from this place, 200 of which are sold for fresh pork after harvest, weighing about 150 lbs. each, the remainder 275 lbs.

Not less than 450 fat cattle are annually sent to market: of butter and cheese not as much made as consumed in town. Of horses, not more than half raised in town, which are used by farmers, millers, &c.

Horse teams are in all cases principally used, on many farms entirely; the common opinion prevailing, that a horse team will plough 1 1/2 acres a day, or in the same time that an ox team will plough one acre.

Besides the common breed of cattle, which by some are preferred to any imported breeds, the Devonshire and Durham cattle are introduced to some extent, and propagated with great attention for market.

An excellent breed of swine prevail here, being a mixture perhaps of several breeds, but the Byfield and the Leicestershire appear to predominate.

With many farmers in Wheatland the ruta baga, mangel wurtzel and sugar beet, are articles of considerable attention, and considered much cheaper than hay for keeping stock. A common crop of ruta baga is about 600 bushels to the acre, planted on clover lays with once ploughing, rolling, and harrowing, in drills, 3 feet by six inches, by a drill barrow, one man ploughing 3 or 4 acres a day; from

the 10th to the 20th of June is the time for sowing, some prefer the first of June.

Apples are also fed to different animals, especially swine, for which they are considered excellent feed, especially for store hogs. In one case a farmer kept for two or three months in winter, thirteen hogs weighing 150 lbs. or more, upon two bushels of apples a day, given raw, a bushel in the morning, the same quantity at evening, and never had hogs do better. For fattening hogs, apples need boiling and mixing with provender.

A plough in considerable request, perhaps generally preferred in this vicinity, is an improvement on the Clute and Iden Patents. Jointed harrows are common and of different patterns. In some instances the old fashioned triangular harrow is used, and for grounds not well subduced, frequently preferred.

It is evident from the facts here stated, that wheat, clover, and sheep, aided by a free use of plaster, may form the ground work of a good system of farming. It is also evident from these and other statements from various sources, that hay is not the cheapest feed for stock during the winter, and that the ruta baga, wurtzel, carrot, beet, potato, &c., are objects worthy of more attention than they generally receive from farmers through the country.

The soil of Wheatland appears to be no less favorable for the cultivation of intelligence and sound morals, than that of baser productions: of which I was furnished with proofs entirely satisfactory, both by private interviews with many of the citizens, and at a public meeting held for the purpose of adopting measures to elevate the character of common education, especially among farmers, and no less through the agency of families than of schools. In connection with the intelligence and morals of our country, a general feeling, many regrets, and not a little indignation were expressed at the character of the matter filling our public journals, more particularly the political papers.

On the subject of advancing the intelligence and elevating the morals of American citizens, especially in their own community, several resolutions were passed at the meeting referred to, which, on some future occasion, I may put into your hands, to be disposed of at your discretion. Among these resolutions, the one relating to our Public Journals, are not only passed unanimously, but with a general and strong expression of feeling on the subject, I probably wring of a careful perusal and attention of the conductors of the American press generally.

On some future occasion, I may give you a particular account of several farms I visited, embracing the kind and amount of products, modes of culture, expenses, profits, &c.; at present I will only add the respect and esteem of

Your Friend,

JOSIAH HOLBROOK.

The Mexican states, before the revolt in Texas covered 27 degrees of latitude, and had a territory equal to that of France, Spain, Austria, Portugal and Great Britain combined. Over this immense region they had a scattered population of eight millions, of all castes, conditions and colors; and yet how imbecile and powerless, as a people and a nation they were, and still remain.

Flour is selling in Cincinnati at \$1 25 per barrel.

AGRICULTURAL.

VIRGINIA AGRICULTURE.

We copy the following correspondence from one of the most instructive and ably conducted agricultural publications in this or any other country, the Farmer's Register, published at Petersburg, Va.

The enterprise of our neighbor Kenrick in transferring a portion of his lucrative cultivation into the Old Dominion is highly creditable, and shows the true spirit of Yankee enterprise. His observations on the low state of agriculture in Virginia are interesting, and have called forth a spirited reply from Mr. Ruffin. We shall allow both parties to be heard, and leave every reader to form his own judgment.

H. C.

Alleged Effect of Slavery on the Agriculture of Virginia.

To the Editor of the Farmer's Register:

PORTSMOUTH, Va. April 1, 1839.

You have indeed, from all accounts, a vast and fine tract of country, from 60 to 80 miles broad along the whole Atlantic coast. This vast country is now, in a good measure, a desert, or covered with forests—the land ruined by continual cropping, and now deserted. Good lands, as I am told, may now be obtained in this vicinity for from \$5 to \$8 an acre, in part covered with a young and luxuriant growth. We know the causes of this destruction, and these same causes continuing, it seems not very probable that these lands will ever again be recovered or rise in value until those causes are re-

about 500,000 slaves, which are probably valued by their owners, one with another, at \$400 each, or \$200,000,000, for the whole. Now, can any one doubt but that if all these slaves were emancipated, that the lands of Virginia would rise \$5 an acre, and this rise of \$5 an acre would be equivalent to the estimated value of all the slaves. I am persuaded, however, that the rise of lands would be far greater; and that, were all the slaves emancipated at this day, the State of Virginia would experience a clear gain of more than \$500,000,000 in the rise of their lands alone. Emigration would then take place to a great extent from the northern free States. The Yankees would then flock hither, and hire up at advanced wages the freed slaves, and the whole of eastern Virginia would then become a perfect garden. The advantages of this part of Virginia for the production, especially of all early vegetables and fruits for the supply of the markets of the great cities of the northern and middle States, is very great, and unrivalled; as these cities, by the aid of rail-roads, and steam navigation will soon be brought within 24 hours of Norfolk; yet the seasons are at Portsmouth full a month in advance of some of these northern cities. The wheat of lower Virginia almost always commands a higher price than that of the north, new flour being preferred by all. The fields of Virginia may be reaped and the produce converted into flour, and this flour for sale at New York and Boston even before the wheat-fields of those cities are ready to harvest.

Although the prices of provisions are generally at least as low in this part of Virginia, and the price

those in the southern States, may be surprised that the foregoing condemnation of slavery should have been admitted to our pages. The former, probably, suppose that southern men and slaveholders fear, and therefore object to, the expression of opinions contrary to their own on this subject; and many in the south, in their violence against northern anti-slavery fanaticism, show themselves to be as bigoted and fanatical in opposition, and are disposed to regard any expression of such opinions as both insulting and designing injury to themselves. But we are not of this class. Maintaining as we do, and as staunchly as any can do, the rights of slaveholders, both private and political—maintaining too, that the institution of personal slavery, under certain circumstances, (and which are in full operation in the greater part of the southern states,) is politic and proper in itself—maintaining also, that the institution in general, has been highly beneficial to the world, in increasing labor, wealth, civilization, and refinement, and even in spreading good morals and religion—still, we neither object to others considering these opinions as altogether erroneous, nor to their endeavoring, by argument and evidence, to sustain their opposite opinions.—Domestic or personal slavery; even upon our own view, like every other wide spread and widely operating institution, has its evil as well as its good effects; and in regarding it, perhaps we may allow too little weight to the former, and too much to the latter—just as we deem that our northern correspondent errs in the opposite manner. But no matter how erroneous may be his views and those of his countrymen in general, on this subject, it is

both for public and private interest, in Virginia we offered, in the same letter, to sell to him or to a company formed for the purpose of making silk, a marled farm of 600 acres of land, and to vest the purchase money in the joint stock of the adventurers. We quote from memory, but believe with no material variation from the substance of the letters; and the opinions then so expressed, and the investments which we were then (in advance of all other adventurers in Virginia) ready to make in silk culture, if some practical and experienced cultivators would undertake the management, may serve as strong proof, in addition to others of another kind recently adduced, that we have long and earnestly advocated the advantages of silk culture in this region, and would have risked much of our property on the soundness of that opinion. It should be observed that at that time no one anticipated the multicaulis speculation, and the enormous prices which have since been obtained—or counted on profits from so strange a circumstance. For our own part, we had not then the slightest expectation of ever selling a plant from the silk farm then proposed to be established; and Mr Kenrick, in his scheme, probably counted on merely making the usual sales and profits of that branch of his general nursery business, to be increased in product and amount, however, by his availing of our more genial climate. To that operation he limited his following of our advice; and though at the end of two years, he sold plants (as we have heard from other authority) from a few acres of land near Richmond, for \$30,000, that enormous profit was a result beyond all previous calculations, and for which we claim no credit in having encouraged the scheme by our advice. As we failed in inducing the commencement of silk culture as the main object, we cared nothing about the mulberry culture alone; and did not then set out a single plant, nor until a year afterwards, when it was caused by accident, and not by design, or by calculations of profit.

It was under these circumstances that Mr Kenrick became a cultivator to some extent in Virginia, though still continuing a resident of Massachusetts; and we have thought that the statement, though a digression, might be interesting and useful, as exhibiting, in a strong light, the practical proof of the superiority of our climate. For the adventurer has not only labored under all the disadvantages of remote residence, but also under those caused by his prejudices against the facilities offered by our cheapest and best labor.

Mr Kenrick is altogether mistaken as to slavery being the cause of the admitted agricultural degradation of the fine region near Portsmouth and Norfolk, and, in a less degree, that of lower Virginia generally. The holding of slaves doubtless in some measure helps to produce the general result, just as the facilities for comfort, ease, and rich products of land and labor, so abundantly offered to our countrymen by other circumstances, all tend to lessen exertion, and to make us indolent and careless. This is but according to the nature of man; and if there were not a slave in Virginia, there would still be so much more ease in acquiring the bare necessities of life, (and, on the seaboard, many of its luxuries also,) that our people would, in labor and frugality, still be far behind the crowded people of Massachusetts, who, on a rocky and barren soil, and under a rigorous climate, must both toil and save incessantly—or starve. It is because necessity does not drive, that perhaps on no one farm

in Virginia is there so much economy of means and of expenditure, as is general in the north. But in other respects, there is as well planned and as skillfully executed agricultural practice, and altogether far better farming in Virginia, than in Massachusetts. It is true that *good farming* is rare here; and so it is elsewhere. But it will surprise Mr Kenrick to be informed that our best farming in lower and middle Virginia is always to be found in connection with, and absolutely dependent on, the most complete establishment and entire use of slave labor. We could name many farms in Virginia of which the skillful and excellent cultivation, the system of improvement, and the general management, could not be deemed otherwise than admirable, even to a New Englander the most intolerant of and prejudiced against slavery; and we may add, though not bearing on our proposition, that these are generally the places where the comforts of the slaves are best cared for, and their condition is better than that of ninety-nine hundredths of the free laborers throughout all other parts of the world. It may be true, on each one of these our very best cultivated and best managed farms, that a Yankee might pick up a comfortable income, and means for maintenance, in the matters regularly and continually wasted and totally lost. But it may also be said, that without the cultivation and returns being very good, and there being much profit actually made, so much waste and loss could not be afforded. Even with all our admitted faults of system, and of execution, we feel assured from such information as we have, that there are many farmers in Virginia who deserve to rank in their profession at least as high, if not higher, than the best in New England. Still, we yield the palm, and freely award the praise to these our northern brethren, of greater economy in everything, comprehending better habits of labor and of frugality. But this latter difference and superiority on their part, are owing to the difference of other circumstances—the greater pressure of necessity in the one case than the other, and not to the existence or absence of slavery. Nor do we mean to underrate these highly valuable elements of agricultural success. On the contrary, we have continually admitted and applauded the superior merits of our northern countrymen in these respects, and recommended their example to be better followed here.

There are many circumstances which have concurred to depress the agriculture of Virginia, which we will not here stop to rehearse; and there is no part of the state where agricultural skill and products are lower, compared to the great natural advantages of the lands, than in the region in which Mr Kenrick is now cultivating, and to which he more especially refers, in these respects. And if a number of his more industrious and frugal countrymen will come among us and avail of the advantages which ours so much neglect, we are confident that, either with the benefit, (or incumbrance, if so considered,) of slaves, or without, that they can even now make far greater agricultural profits than anywhere in New England.

If the capabilities of an agricultural region are to be estimated by its *worst* instead of its *best* practices, we might, perhaps, find even in Massachusetts, subjects for condemnation as great as any in Virginia; and grounds on which to pronounce the northern people as deficient as any elsewhere, in system, in judgment, and even in their peculiar and acknowledged merits of provident foresight and economy. We will quote, for example, a passage

copied from the Survey of Berkshire, by the Agricultural Commissioner of Massachusetts, which has just been published, and from which excellent reports we shall copy sundry items of *good husbandry* with much more gratification than we thus present defects for comparison and illustration.

“Yet with all this it must be admitted that the agriculture of the county in extent and productiveness is far below what it should be. As well as I could learn, Egremont is almost the only town in the county which raises not only its own bread, but has some for exportation. Vast amounts of flour, grain of various kinds, pork and dairy produce are brought into the county from the neighboring states of New York and Vermont. It was asserted as a fact, and if so it deserves notice, that two years since, some families in one of the best towns in the county, were without bread of any kind for a time, from the impossibility of obtaining it. They were persons for example, who worked for the large wool farmers. They asked for money for their labor; but money was not to be had, because the clipping of wool, owing to the derangements of business, had not been sold. They asked to receive their pay in grain; but the wool farmers had abandoned all cultivation for the sheep husbandry. They asked for their pay in pork, but the farmers who raised no grain could raise no pork. Now whether this be a true history or fabulous, it illustrates clearly the error committed in abandoning the production of grain.”—*Second Report of the Agriculture of Massachusetts.*

If these facts had been stated by a northern traveler, of a *cotton* instead of a *wool*-growing region, and of *slaves* instead of *free laborers*, what would have been the measure of severity of comment, both on the improvidence and the inhumanity of the farmers!

MASSACHUSETTS SOCIETY FOR PROMOTING AGRICULTURE.

PREMIUM LIST—1839.

The Trustees of the Massachusetts Society for the Promotion of Agriculture, announce to the public their intention to offer in premiums not only the sum granted by the government, but the whole amount of the income of their own funds; and as they omit for the ensuing year their Cattle Show at Brighton, they propose in addition to their usual premiums on agricultural experiments, the following premiums—

FOR STOCK.

From any county of the Commonwealth to be exhibited at *Worcester*, on Wednesday, the ninth day of October next, being the day of the Annual Cattle Show of the Worcester County Agricultural Society, viz:

For the best bull, not less than 18 months old \$50
For the next best 30

The competitor may claim for any animal whether raised in the State or not, provided the owner be a citizen of Massachusetts, and on receiving the premium will oblige himself to keep him for use at least one year after the show, within the State.
\$50
For the best fattened ox
For the next best 40

It is required of the owner to certify in writing, the age, breed, manner of rearing, and time and mode of fattening, with such other facts as will enable the Trustees to decide the cost, and to estimate the weight which will give the richest and best

beef: one object being to show the relative price of such quality of beef to the cost of production. For the best boar, not less than six months old \$20

Of the most valuable breed, and to be kept at least one year for use within the State.

Notice of the intention to offer animals for the foregoing premiums must be given in writing to Benjamin Guild, Esq., Boston, Recording Secretary of the Massachusetts Society for the Promotion of Agriculture, on or before Monday, the seventh day of October next, and the animals must be placed in the pens at Worcester, by nine o'clock, A. M. on the said ninth day of October being the day of the Cattle Show.

They also propose the following premiums to be awarded to competitors from any part of the Commonwealth who shall exhibit at the Cattle Show of the Berkshire Agricultural Society, on Wednesday, the second day of October next, at *Pittsfield*, viz:

For the best team of working cattle from any one town, consisting of not less than 15 pairs	\$30
For the second best	25
For the third best	20

	\$75
For the best stock of neat cattle	15
For the best yoke of working oxen	10
For the best yoke of four year old oxen	10
For the best yoke of three year old steers	10
For ditto two year old ditto	10
For ditto yearling ditto	6
For the best milch cow not less than three years old	10
For the best two year old heifer	8
For the best bull	10
For the best bull calf	5
For the best heifer calf	5
For the best buck	7
For the best five ewes	7
For the best boar	6
For the best sow	4

The distribution of the amount on stock having been thus subdivided at the suggestion of the trustees of the Berkshire Agricultural Society, the competitors will be expected to comply with the rules

The person or persons making the inspection, will require of the respective owners or occupants of farms, answers to the following inquiries:

Of how much land does your farm consist, exclusive of wood land?

What is the nature of your soil—does it consist of sand, gravel, clay, loam or peat?

If of a part or all of the above kinds, what do you consider the best method of improving them?

How many acres do you till, and how many cartloads of manure (meaning by cartloads 30 bushels at least,) do you generally put on an acre?

Is your manure applied in its long, or green state, or in compost?

Do you spread and plough in your manure put upon fields to be planted with corn or potatoes, or put it into the hills?

What is your method of ploughing and cultivating green sward?

How many acres of upland do you mow, and what is the average quantity of hay upon an acre?

How many acres of grass land do you irrigate: at what season and how long do you allow the water to flow your land, and what is the effect?

Do you manure the land irrigated or any other land you mow, how much to an acre, and what kind of manure do you put on?

How many acres of low land, not suitable for the plough, do you mow, and what is the quality and quantity of the hay cut the present year?

What is your method of reclaiming low, bog or peat lands, and what has been your success?

How many acres of corn have you planted the present season; what was your mode of preparing the ground and the seed, the kind and quantity of manure used to an acre, the manner of applying it, and the quantity of corn raised to an acre?

How many acres did you plant with potatoes the present year; what was your method of planting, your manner of cultivating, and what the average quantity raised on an acre, and what kinds did you plant?

What number of acres of other vegetables did you plant, what kinds, and how many bushels of produce had you to the acre, and to what use shall

How many cartloads of manure do you take from your hog styes in a year, and of what materials is it made?

What number of hands is employed on your farm, and what do you pay for labor?

What is the number of your apple trees, and are they of natural or grafted fruits?

What number of fruit trees have you exclusive of apple trees?

Have your trees been attacked by canker worms or borers, and what is your method of destroying them?

In the cultivation of your farm, do you allow the use of ardent spirits?

The Trustees are desirous that these questions should be answered with as much particularity as possible. The applicant will not, however, be required to answer them under oath, but according to the best of his knowledge and belief.

The Trustees hope and believe that by the method proposed, many important facts may be elicited, and the farming community enabled to derive much useful information from the skill and experience of practical farmers.

N. B.—Claims to be addressed to Benjamin Guild, Esq., in Boston, before the first day of October next.

(Form of the Application.)

TO BENJAMIN GUILD, Esq., Boston:

Sir: The subscriber, living in the town of hereby makes known his intention of applying for a premium for the best farm, and offers the same for inspection.

[Concluded next week.]

Sugar Beet for Milch Cows.—An intelligent gentleman from the eastward, assured us a few days ago, that by giving his cows a peck of sugar beets twice a day, cut up with their hay, he was enabled to get just as rich milk and butter during the winter as in summer, when the pasture was at its best. Now as an acre of ground well manured, planted in this root well attended, would yield beets enough to keep ten cows from the 1st of November till the 1st of May, should not every farmer make

(From the Cleveland Herald.)

EDUCATION OF FARMERS—No. III. FACILITIES FOR KNOWLEDGE.

MR HARRIS—I have already hazarded the opinion that farmers, even in their present neglected state, possess a greater amount of useful knowledge than any other class of the community. I also believe that their knowledge is very limited, compared with what it might be, if they understood and appreciated what they already possess, and improved their advantages for acquiring more. For I am entirely settled in the opinion that their advantages for acquiring useful knowledge are superior to those of any other class, and much superior to those of the professed scholar.

For acquiring a knowledge of natural science, a farm is one of the best schools—is perhaps the best school which can be provided. Chemistry, Natural Philosophy, Botany, Entomology, Geology, Mineralogy, Physiology, Geometry, and some other departments of mathematics, are all brought to view upon a farm, and not in abstract theory merely, but in their practical operations upon a large scale.

While the farm is a laboratory and a cabinet of nature, where the laws and the products of science are constantly and beautifully developed, every operator must necessarily form some acquaintance with these laws and products, and an acquaintance too, more familiar and more thorough, because more practical, than can be acquired by the mere student of books.

The intercourse of farmers with other classes of society, gives them an opportunity for an acquaintance with men and the reciprocal interests of men of different pursuits which the mere student can never form by reading, let it be ever so extensive and various. On these reciprocal interests are founded the principles of political economy, and the necessity of governments and laws to promote and protect those interests. Consequently a farm, and the business of farming, furnishing as they do, the very best school for a practical acquaintance with men and things, are well calculated to produce more enlightened and sounder statesmen than can be produced by a confinement within the walls of a college or the shelves of a library, however long that confinement may be, or however studiously devoted.

The winter evenings of farmers are admirably fitted for enlarging by reading, for arranging under general laws and bringing into the form of science, the results of their summer operations upon their farms. For comparing their own views and experiments with those of other farmers, as given in various agricultural journals, one of which certainly ought to be taken by every man who conducts a farm.

The benefit of farmers' winter evenings will be greatly increased by social meetings of some dozen or twenty in the same neighborhood, once or twice a week. These farmers' social lyceums have sometimes resulted in the course of a winter, in a volume or two of notes, taken from the remarks and statements made in the form of conversation on subjects previously selected for the occasion. By the aid of chemical and philosophical apparatus and specimens of minerals, soils, vegetables, insects, &c., which may be procured at a slight expense, especially when the farmers' lyceum is a department of a town or village society, a great variety of experiments and observations may be made, which could not fail to benefit every individual

who should engage in them, both as a farmer and an enlightened citizen.

Besides the winter evenings and social lyceums of farmers, they may without difficulty, during the summer, even in their greatest pressure of business, find time to read a weekly or monthly journal, like the New England Farmer, by H. Colman, the Genesee Farmer, by Mr Tucker, the Cultivator, by Judge Ruel, or the Farmer's Monthly Visitor, by Governor Hill. They may also try a great variety of experiments, without cost or inconvenience, which have sometimes, at their social lyceums, been distributed and assigned to their respective members, for their special attention, to be reported upon the succeeding winter.

The business of the farmer presents fewer temptations to dishonesty than any other profession. They are consequently, as there is reason to believe, more honest as a body, than any other class. They are also favorably situated for devotional feelings and exercises, and with them, for the study of the bible, that inexhaustible fountain of knowledge and wisdom.

These views and facts, with many others which might be presented, if time and the occasion permitted, will probably be sufficient to satisfy any candid mind that farmers have peculiar facilities for acquiring extensive and sound knowledge, and for becoming enlightened citizens and consistent christians. Their inducements for becoming truly scientific and intelligent, are certainly not inferior to their facilities for such acquisitions. There is perhaps no department of natural science which the farmer has not frequent, and almost daily occasion to apply in his business. Geology and mineralogy teach him the nature of his soil, with the proper materials and modes of improving it. Chemistry teaches the best modes and applications of manures, preparing soils, preserving his hay, roots, and other vegetables, and preparing food for man and beast. Botany teaches the laws of vegetation, the properties of plants, both for cultivation and to be eradicated from his farm, changing and improving his seed, the rotation of crops, &c. Entomology acquaints the farmer with some of his most powerful enemies—with the cut worm, the wheat fly, the canker worm, the grasshopper, the rose bug, the moth, the weevil, and many other insects which he has frequent occasion to destroy, or to avoid their ravages. Natural Philosophy teaches the proper construction and best application of the plough, the scythe, the hoe, the wagon, the harness for the horse and ox, and of every agricultural implement which can be named. Geometry teaches the construction of buildings, the fencing, and dividing of his farm, the measuring of wood timber, and stone, the construction of drains, the digging of wells and cisterns, and many nameless but important operations which he has occasion to perform.

If I am not mistaken, no men or class of men, have so many facilities or so many inducements, for an extensive and familiar acquaintance with science and various departments of useful knowledge as farmers.

But I must close for the present with the high esteem of your friend, J. HOLBROOK.

—

SCHOOL TEACHERS.

MR HARRIS—Furnishing the seventy thousand American schools with well qualified teachers is, perhaps, the most important and the most difficult subject connected with the intellectual and moral

character, and of course with the liberties of our republic. As long as talents, like every other article of commerce, will find the best market, men of high intellectual and moral attainments cannot be retained in schools at twentyfive dollars a month, while other professions offer four times the salary, with one-half the labor and drudgery, and twice the respectability. No matter how many teachers' seminaries are established or how richly endowed, and how great the number or the qualifications of teachers—they can never be retained in common schools until they are paid, and until the profession of teaching stands as high in public estimation as that of law, medicine, or divinity.

It must also be recollected on this subject, like every other in a system of national education, that more than three-fourths of the subjects of education are to be farmers and farmers' wives. Consequently, that system which is best fitted to promote the farming interests, is best fitted for the interest of our Republic. In view of that fact, no one can doubt but a practical and scientific farmer may be better qualified to educate farmers, than the mere scholar, however highly accomplished.—This opinion is entirely corroborated by facts, as many farmers, whom I have known to pursue teaching as a winter profession, for a course of years, have made far better teachers than are ever found in students of a college, or in medical, law, or divinity students, who use teaching as a kind of catspaw profession to aid them into another, which offers larger emolument and higher respectability. While our schools are furnished from the students mentioned, it is evident that they must suffer all the embarrassments, losses and other evils which cannot fail to arise from inexperienced laborers; and not inexperience merely, but those making no calculations and taking no means to acquire either experience or skill.

Let young farmers adopt teaching as their profession during the winter, for a course of years, and these two hitherto insurmountable obstacles, the want of salaries and experience, will, in a measure, at least, be removed. The farmer could afford to teach in his own district, at thirty dollars a month, for four months in a year, better than one who depended entirely upon teaching for the support of a family could for fifty dollars; as with the aid of a laborer whom he might hire for ten dollars a month, or perhaps by the assistance of his sons without hired labor, he might attend to all the winter business of his farm in addition to his services in the school.

It is evident that a young farmer, who at sixteen or eighteen years of age, should commence shaping his course for the business of teaching as a profession, though it might be but for the winter, would act under very different motives, and consequently make greater and higher efforts than a kind of interloper, who had escaped from another profession just long enough, and devoting just hours enough to secure a few dollars to help him on to his more respectable calling. The former would be upon the alert to learn the best modes of teaching, to ascertain what were the best books, and to become truly intelligent and skillful in his adopted profession; while the latter would meet, they always do meet, any proposals for school improvements with "I have not time to attend to them," as I must keep along with my class in college, or I wish to be admitted to the bar next court, or next year, or to a license for preaching or practising medicine.

To my mind it is evident that a practical farmer

who has also the science and the experience for teaching, may be better qualified for educating farmers than any person who makes teaching *exclusively* his profession. By connecting his pursuits of science and reading in winter, with his farming operations in summer, he would not only make education more practical, but farming more scientific, consequently both professions would be benefited. His illustrations and experiments in geology, botany, entomology, chemistry, natural philosophy, geometry, &c., made for the benefit of his pupils in his school, could be applied, during the succeeding summer both by teacher and pupil upon the farm.

Experience fully proves that summer schools, which are composed principally of girls and small boys, are most prosperous under the charge of ladies, as are schools of small children at any season. If a farmer should have charge of a school in his own district for a course of years during the winter, his sister, or as the case might be, his daughter, might have this same school during the summer, when he would still have a kind of double interest in its success.

It must be evident from these views that the plan here proposed for supplying school teachers, would have at least three advantages over that now pursued: viz: it would be economical, it would make teaching a profession, and it would give schools the advantage of practice with theory. It must also confer upon children two advantages which would be lost, if teaching was *exclusively* a profession, viz: the advantage of experimental knowledge with theory, and to all young children, and to girls advanced in education, the advantage of ladies for their teachers.

In connection with the system here presented, circuit schools, to be held weekly or semi-monthly, and attended by teachers and lecturers who were familiar with the sciences, and supplied with apparatus and specimens for illustrating them, would be highly important, especially in aiding young gentlemen and ladies in qualifying themselves for teaching. Much might be said on the economy and power embraced in a system of itineracy, whether connected with religion or education, but the pres-

from the cow, is poured into large earthen pitchers and placed in a vat of cold water, which quickly reduces the temperature. It is then placed on shelves until the cream separates, when it is taken off and placed in vessels for churning. In these it is first allowed to become a little soured, and then the churn is half filled with the cream. In the best dairies, churning is performed daily; the system being so arranged, that a supply is constantly in readiness. In winter, a little boiled warm water is added to the cream to give the proper temperature previous to churning; and in very cold weather, it is sometimes submitted to the cold bath to reduce the heat. The butter, when taken from the churn, is put in a shallow vessel and carefully washed with pure cold water, and then worked with a slight sprinkling of fine salt, whether intended for rolls or for barreling. The butter is considered best, when the cows have been at grass about three weeks; it is then delicious—is made into fanciful forms of animals, pyramids, &c., and stuck over with fragrant flowers, and sells as high as sixty or seventy cents per pound. When intended for packing, the butter is worked up twice or thrice a day, with soft, fine salt, for three days, in a shallow tub; there being about two pounds of this salt used for fourteen pounds of butter. After this thorough preparatory working, the butter is then hard packed in thin layers into casks made perfectly sweet and clean. The wood preferred is oak, smoothed carefully inside. Three or four days before they are used, the casks are filled with sour whey, and this stands until they are emptied and cleansed for the packing of the butter. It is clear, from this description, that independent of the perfect neatness observed in every part of the process, the excellence of the Dutch butter, and the ease with which it is kept in its original sweetness when packed, is owing to the manner in which it is freed from the least particle of butter-milk, by the first washing and the subsequent repeated workings, as well as to the perfect incorporation of the salt by the same process.—There are many of our American dairies that produce superior butter; but as a whole, that offered in our markets is a miserable

which was pulled from a potato at planting time, and set by itself in level ground in a garden, and not killed at all during the summer. The mother potato from which the sprout was taken, also, by the same level mode of cultivation yielded a full peck of potatoes which were dug at the same time. These potatoes were planted in a good soil and kept clear of weeds and the ground stirred and kept loose to permit light and air to penetrate the surface freely; and their produce was such as to satisfy any reasonable mind of the inutility of making large hills, and condemn the practice as strongly as it is rejected by rational theory. It is true that in spite of the hilling, good crops of potatoes and corn are obtained on good land by the help of abundance of manure. This, however, does not show advantage from hilling as much as it does the fact that the operations of nature are not easily baffled. Effort after effort is put forth, from time to time, by the struggling vegetable, to accommodate itself to its new position relative to sun and atmosphere, as it is covered deeper and deeper at the several hillings; and frequently it hardly recovers from one shock so far as to push its fine, tender rootlets to the surface in quest of dew and sunshine, before, with the kindest feelings, it is most unmercifully buried still deeper than before, and left, as best it may, to wage its last conflict and successfully penetrate the super-incumbent mass of clods and rubbish, and renew its entire set of surface roots, or fail of accomplishing the great object which seems to animate the whole vegetable kingdom—the production of its kind.—*Hampshire Gazette.*

GILKIES.—This ought to be the name of the favorite potatoes. They are commonly called, in the Philadelphia market *Mercers*—frequently also *Neshannocks*, and sometimes by corruption *Shannocks*; I perceive also the name *Shenangoes* (Shenangoes) applied in some of the eastern papers.

All men regret that Columbus was robbed of the honor of giving name to the world he bestowed upon civilized man; and a correspondent regret actuates the writer in reference to one of its chief products. It is now too late to do honor to the illus-

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, JULY 17, 1839.

STATE OF THE SEASON.

The season thus far may be pronounced highly propitious. Grass in general has seldom been more abundant. Hitherto (12th July) the weather, owing to the frequent showers, has been unfavorable to the curing of hay; but a great part of the grass is yet hardly forward enough for the scythe; and according to invariable experience we look for one or two good haying weeks. Rye, both spring and winter, promises a more abundant yield than has been known for years. Barley is very luxuriant. Oats are cultivated (we are speaking of Norfolk County, particularly to which our observations have been of late limited) to a very small extent. Potatoes show an uncommon thriftiness. Indian Corn is of a good color; it is generally small; but is advancing with great rapidity; and there is yet time enough for a crop. Wheat is seen in very small patches only, but these promise well. So much disappointment in this crop, owing to the drought, was experienced the last season, that comparatively very little was sown. Here and there are met with a small extent of ruta baga and carrots. With the exception of the town of Quincy perhaps an acre of carrots, in one piece, is not to be found in the whole county; and yet there is good reason to think that no crop can be cultivated, which to a certain extent would better pay on every farm the cost of raising, where suitable land can be found for that purpose. Parsnips cannot be said to be cultivated at all among us, excepting a very few in the garden for the table. The value of this vegetable for stock is not known among us. In the Islands of Jersey, and Guernsey they are extensively cultivated and highly esteemed for their dairy stock. The only experiment we have ever made with them was in feeding out about eighty bushels to our milk cows and fattening cattle in the spring. They were highly relished by the animals; and this small experiment satisfied us that nothing of the kind could be better for milk or beef. These parsnips had remained in the ground all winter and came at a season, when such feed was particularly valuable. There was some difficulty in digging them on account of their length and the number and tenacity of their fibrous roots; but, if they are raised on high ridges instead of a flat surface, this difficulty will be obviated by being able to run a plough by the side of them.

We would gladly avail ourselves of every favorable opportunity to draw the attention of farmers to the subject of raising succulent vegetables for the winter feed of their stock. In respect to the general health and condition of their cattle, in respect to the increase of dairy product, and of beef and pork, in respect to a profitable return for labor and expense incurred, in respect to the general improvement of the farm by fine till and the means of increasing the manure, the cultivation of these vegetable crops, carrots, sugar beets, parsnips, mangel wurtzel, ruta baga, &c. cannot be too strongly urged. It must be at the foundation of an improved husbandry. Parsnips are represented as furnishing a most excellent feed for swine. In this matter we have had no experience; but are entirely disposed to credit in the case every thing favorable, which may be said of them. They are liable to a few very casualities from vermin and frosts; and when cultivated on ridges are as little expensive as any vegetable of the kind which we can raise.

H. C.

HAYING.

This great operation is now going on in earnest in this part of the country. In the interior it is postponed to a much later period. The proper time of curing hay is a matter upon which, among the best farmers, a diversity of opinion and practice prevails. The clovers, it is believed, should be cut when the flowers first begin to fade. The fine grasses on the alluvial lands of Connecticut River, known there generally under the name of the English Bent, require to be cut quite early, or the hay is hard and wiry and not relished by cattle. In respect to herds grass or timothy it is a debatable point, whether it should be cut in the flower or when the seed is formed and almost ripened. The greener the hay, provided it is sweet, the better it always sells in the market. The nearer it approaches to ripeness, the more nutritive matter is contained in it according to the analytical experiments of Sinclair upon various grasses, as given in the tables published. How far these tables are to be relied upon as demonstrative of the actual truth in the case, remains to be seen. Many persons are of opinion that the decision of a jury of cattle upon the sulp it would be much more satisfactory and conclusive. We wish some experiments could be made by which this matter should be brought to the test. We are not prepared to say exactly how these experiments should be made; but a reflecting and observing farmer, disposed to test the matter, might easily come to a satisfactory solution.

Sundry modes have been suggested for the curing of clover hay. No grass suffers greater deterioration from excessive drying and much tossing about. Two of the best farmers in the State, in Middlesex County, say, their practice is, after cutting clover, not to spread but simply to turn the swath; and in the afternoon of the day on which it is cut, put it carefully into cock, and let it remain in cock until it is sufficiently made to be carried into the barn. When this is to be done they merely turn the cocks over, so that any moisture, which may be at the bottom of them may be dried off. They say in this way their hay comes out perfectly bright and sweet; and they value it more than any other as feed for their milk cows. We know the general management and improvement of their farms are not excelled by any in the State. A very intelligent farmer in the interior of New York, has stated to us that he practises on the same plan and with perfect success. We know of others who have experimented in the same way and have failed. So it is with almost every thing in life. Some men succeed while others in the same circumstances are sure to fail. If any succeed in the case then it is certain that the cause of failure must be in ignorance or neglect of the proper method of management. The thing is of much importance; for in general clover hay as it is commonly cured is of little value and fit for not much else than litter.

The importance of a free ventilation in barns is not always enough considered. In the report of the Agriculture of Berkshire, under the account of the Shakers' Establishments, the construction in the barn at Hancock with a view, expressly to this object, is particularly described; and at least suggests some useful hints on this subject. In some parts of the north of Europe the mode of curing hay is thus described. The hay is put up quite green in stacks. It is raised on staddles or beams sufficiently high from the ground to admit a free circulation of air underneath the stack. A sort of chimney is formed in the middle of the stack as it goes up, either by building round a barrel or a bag filled with hay, which is drawn up by degrees as the stack rises; and thus a continual circulation of air is kept up through the stack, while the hay is drying; and the

vapor arising from the heating and drying of the hay passes off by this chimney. In such cases they have a thatched covering over the stack, resting upon four poles, which is often seen among the Dutch farmer in our own country. We know nothing of this mode of curing hay but from the accounts thus given. The hay, as it is presented, is perfectly cured in this way. The account has certainly sufficient plausibility to demand a trial on a small scale.

H. C.

RUTA BAGA.

Many persons have gone considerably into the cultivation of ruta baga the present year; but either from imperfection of the machine used in sowing, or from want of care in using it, or from badness of seed, or from unfavorable condition of the soil, or some unknown cause they have come up badly and the fields are disfigured by frequent banks. In such cases we have seen persons frequently employed in transplanting, with a dibble, from spots, where the plants were thicker than it was desirable they should remain. This mode of transplanting is unnecessarily laborious. It is not with this plant as with tap rooted plants; and it is only requisite to make a hole with the corner of a hoe and lay the plant in bringing the earth round it. In this way nearly two thirds of the labor will be saved; and the plant are as sure to live as if put in with a dibble.

H. C.

BONE MANURE.

Extensive, or rather numerous, experiments are making in all directions with this manure in its application to various crops; grass, corn, potatoes, and other vegetables. The Commissioner of Agriculture earnestly treats the farmers concerned in them, to do himself and the agricultural community the favor to note such experiments with all practical exactness, and at the close of the season communicate the results.

H. C.

INDEPENDENCE.

We meant to have said something at the time of the celebration of this great national anniversary. To speak of it now might appear like taking a leaf for present direction out of last year's almanack. Some will as likewise what has this to do with agriculture. We only reply that if our farmers in the free States will but at a moment compare their happy and privileged condition with that of the serfs of Russia, the peasantry of the middle countries of Europe, and the agricultural classes in Great Britain, oppressed as they are with taxes and impositions of various kinds, in few cases the freeders of the soil, but mere tenants at will, and almost universally regarded with disdain as of a low caste in society, our own New England farmer, in reflecting on that noble and brave declaration, which made their country free and bought with it all the blessings of civil freedom, will find occasion to thank God with overflowing hearts for the full possession of the richest blessing which, in the history of the world, have ever yet fallen man in his social condition.

H. C.

Massachusetts Horticultural Society.

EXHIBITION OF VEGETABLES.

Saturday, July 6, 1839.

Clusters of a new kind of vegetable, called *Potamoisim*, exhibited by Mr E. Sayers, with a description of the manner of cultivation, &c.

Mr John Hovey, of Roxbury, exhibited fine specimens of head lettuce, very large, although quite late in the season.

Mr Pond, of Cambridgeport, exhibited some fine hubarb, (called the Giant Rhubarb)

For the Committee,

JAMES L. L. F. WARREN, *Chairman.*

EXHIBITION OF FLOWERS.

Saturday, July 13th, 1839.

Some fine flowers by Thomas Lee, Esq., among them we noticed *Rhexia Virginica*, *Potentilla Hopwoodii*, *Lyxura*, and *Stipa splendens*

Bouquets—by Messrs Jno. S. Ellery, Mason, Meller, Jovey & Co., Winsup, W. E. Carter, John Hovey, Wm. Kenrick and Samuel Walker.

Carnations—by Messrs W. Meller, S. R. Johnson, Iss Summer, of Dorchester, and S. Walker.

*Dahlia*s—by E. Bred, Esq., of Charlestown, several specimens. By Jno. S. Ellery, Esq., of Brookline, viz. *Daubigals Augusta*, *Boot's finepurple*, *Pieta formosissima*, *Lady Fordwich* and *Nuttal's Scarlet*; and also two specimens by Mr Wm. Meller, of Roxbury

Heaths—by John Towne, Esq., of Boston.

Native plants—by E. Weston, jr., Esq., and Francis Parker—*Hypocricum perforata*, *Andromeda paniculata*, *Lyrola rotundifolia*, *Veronica scutellata*, *Lysimachia rigida*, *Arethusa ophioglossoides*, *Cymbidium pulchellum*, *Calla virginica*, *Pontederia cordata*, *Asclepias syriaca*, *ambucus Canadensis*, *Vaccinium macrocarpon*, *Ostrya virginica*, *Chephulanthus occidentalis*, *Scutellaria gabculata*, *Orechis grandiflora*.

By William Oakes, Esq.—*Magnolia glauca*, *Vaccinium frondosum*, *Calopogon pulchellus*, *Prinos laxigatus*, *agonia ophioglossoides*, *Lythrum hyssopifolia*, *Alnus adula*, *Conwallaria triflora*, *Lalium Philadelphicum*, *obelia Claytonii*. For the Committee.

S. WALKER, *Chairman.*

PARTICULAR NOTICE.

CARNATIONS.

Owing to some of the principal cultivators not having their specimens of *Carnations* ready to exhibit today, the premiums were postponed until Saturday next, 15th inst, when the prizes will be awarded.

Per order,

S. WALKER,
Chairman Committee on Flowers.

EXHIBITION OF FRUITS.

J. S. Ellery, Esq., Woodland, Brookline, exhibited lack Hamburgin and White Classelas Grapes of very nice quality

Otis Johnson, Esq., of Lynn, exhibited fine specimens Black Hanaburg Grapes.

Mr Thomas Mason, of Charlestown, exhibited beauti-

THERMOMETRICAL.

Reported by the New England Farmer.

Range of the Thermometer in the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded Northernly exposure, week ending July 14.

July, 1839.	5 A.M.	12, M.	7 P.M.	Wind.

Friday,	12 67	81	64†	S. W.
Saturday,	13 58	80	70	W.
Sunday,	14 60	77	66	E.

* One o'clock.

† Sudden shower of rain and hail.

STRAWBERRIES.

Those who are desirous of cultivating this delicious fruit, are respectfully informed that the subscriber has succeeded, after a number of years experimenting upon the *Strawberry*, not only in obtaining *new varieties*, but in ascertaining the best method of cultivation.

Specimens of the fruits grown in his *Garden* have been exhibited at the *Massachusetts Horticultural Society Rooms* the *four past years*, and are also well known in *Pinehill Hill Market* to need a particular notice here.

He has for sale at his *Garden* in *Brighton, Mass.*, the following *right varieties of Plants*. They are of superior stock and quality, all warranted to be truly named and free from the *nutrients* often found in those offered for sale promiscuously.

Those who are in want of *strawberry Plants*, are respectfully invited, and they will find it interesting, to call at the *Garden* and see the *manner of cultivation*. The method of cultivation, and any information desired will be cheerfully given.

The subscriber would state that from many years *personal experience*, he is satisfied that plantations of these vines made the last of July or early in August, by careful and constant attention will produce *heavily or quite as much fruit* the season following as those plantations made in the Spring will produce the second year.

Warren's Seedling Methven.—A new and valuable kind. A free bearer, fruit very large and juicy; fruit measuring four and a half inches have been exhibited the present season.

Methven Castle.—Fruit extremely large, high flavored, and showy. Specimens of this kind have been exhibited at the Horticultural Rooms for six years past, measuring five and a half inches in circumference.

Bath Scarlet.—Fruit large, full bearer, and beautiful scarlet.

Early Virginia.—This is considered the earliest fruit—a free bearer, hardy, and very early; decidedly a *fine kind for market*.

Royal Scarlet.—Fruit long oval shaped and juicy.

Hautbois.—Fruit smaller but very numerous.

English Wood.—Fruit well known.

Monthly.—Fruit is gathered from the vines from June to October, and in good quantity and fine quality.

Orders left at the *Garden*, or directed to the subscriber, *Brighton, Mass.*, or left at Messrs J. Bredk & Co's *Washington Boston* will be promptly attended to.

MISCELLANEOUS.

Mr Allen Park, one of the present English judges, is a religious man, of whom the following amusing anecdote is related in a work entitled "The Bench and the Bar," respecting the evidence of a youthful girl:—

A very awkward exemplification of Mr Justice Park's injudicious way of thrusting forward his religious sentiments in court, occurred some time ago at a trial at one of the county assizes. A little girl, about ten years of age, was put into the witness box to give evidence on the trial then proceeding with. The counsels opposed to the party for whom the young creature appeared, maintained that her testimony could not be received on the matter then before the court, because of her extreme youth, adding that he had no doubt it would be ascertained on examination that she did not understand the nature of an oath.

"We shall soon see what is the extent of her mental capacity," said his lordship. "Little girl," he continued, addressing himself to the youthful witness, "little girl, attend to me."

"Yes, sir," said the girl, making at the same time one of her best curtsies.

"Have your parents given you a religious education?"

"Yes, sir," lisped the young creature.

"They have taught you the Church Catechism, I have no doubt."

"Yes, sir."

"You know the ten commandments do you?"

"Yes, sir."

"You could repeat them, I dare say, if you were asked?"

"Yes, sir."

"You're a very excellent girl—a very good child indeed. And of course you have learned the Apostles' creed?"

"Yes, sir."

"I am very happy to hear it. It is a great credit to your parents that they have brought you up in this way. No doubt you have also got the Lord's prayer by heart?"

"Yes, sir."

"And could repeat it at any time, if asked?"

"Yes, sir."

"That's a very good girl. Now, my excellent child, tell us what you do before going to bed?"

The young innocent was silent.

"Don't be ashamed my good girl, to answer the question. Pray do tell us what you do every night before going to bed."

The girl hung down her head and said nothing.

"Pray don't be afraid or ashamed to answer the question. What do you do just before going to bed?"

"Tell his lordship," whispered her father, who stood beside her.

"Aye, come, do tell us," said his lordship, who had heard the whisper. "Speak up, and tell us what you do before going to bed?"

"Put off my clothes and put on my nightcap," answered the girl, raising up her head and looking Mr Justice Park, with great simplicity, in the face.

The Court was convulsed with laughter at the oddity of the answer, when compared with that which it was manifestly the object of the judge's question to elicit.

Origin of a fashion.—The latest fashion for gentlemen's hair, that of wearing it parted on the

forehead and hanging in long locks over the ears, is said by the editor of the Newark Advertiser to have originated as follows:

"A young Frenchman went into Egypt trading. In his avarice of money he sometimes overreached his customers, and being detected was caught and bored through the ear. This was so trivial an obstruction to his money making, that he continued his "Yankee tricks" until his ears were several times bored, and at length cut off entirely. The cheat returned to Paris with a considerable sum of money, which, being a young man, he desired to sport among his friends. But how should he hide the shape of his ears, lopped off for swindling? He bethought himself of permitting his hair to become long, by which he completely concealed his deformity! The fashion was soon after adopted in a limited circle in Paris, and is now aped by the dandies that trip along our trottoirs with their toes pinched into a roll."

Simple remedy for Dist in the Eye.—Most persons suppose the pain arising from getting foreign substances into the eye, is owing to the delicacy of that organ. This is, however, a mistake, which any one can ascertain by rubbing his fingers over any part of the ball.—Indeed, surgeons say that operations on the eye are performed with far less pain than on many other parts of the body. But the inner membrane of the lids is susceptible, and as all have experienced when any substance is pressed between it and the ball, the sensation is extremely painful. If any one in that situation will take hold of the eyelid and pull it over one or more times, the substance will roll from under it, and all pain instantly cease. This is a common remedy.

Navies.—The following statement of the navies of the world, at the close of the last year, may probably be relied on. It is given by Sir John Barrow, and was unquestionably prepared with care. At that time England had either afloat or in ordinary, 90 ships of the line, 93 frigates, and 53 steam ships of war. France, 49 ships of the line, 60 frigates, and 37 steamers. Russia, 50 ships of the line, 25 frigates, and 8 steamers. United States of America, 15 ships of the line, 25 frigates, sloops, &c., and 1 steamer. Egypt, 12 ships of the line, 7 frigates, and 1 steamer. Turkey, 15 ships of the line, 15 frigates and 3 steamers. Holland, 8 ships of the line, 18 frigates, and 4 steamers. Denmark, 8 ships of the line. Sweden, 10 ships of the line, 8 frigates and 2 steamers. Spain, 3 ships of the line and 4 frigates. Naples, 2 frigates and 1 steamer. Sardinia, 6 frigates and 2 steamers. Additional to this, Holland has 104 gun boats, 10 in commission; Denmark has 67 gun boats; Sweden has 242 gun boats and 5 bombs; Norway has 85 gun boats and 2 bombs, besides 30 gun boats building, each to carry two 60 pounders.

A large Shark.—A shark was taken on board the brig Helen, of this port, on her last passage to Matanzas, which measured 18 feet. His liver contained ten gallons of pure limpid oil; his jaws when extended, measured 21 inches apart; he had 44 rows of sharp saw teeth—220 in number. The day previous to taking him, a large shark jumped on the gunwale of the boat and capsized it, and took one man; after which a chain hook was baited with a large piece of beef, and this monster of the deep was shortly taken.—*Providence Journal.*

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street.

Marshall's Weeder, or Hand Cultivator.

This is a very useful article for going between vegetables, in order to keep down the weeds. A man with one of these machines, will do more work than four or five with the hoe. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street July 10.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street. July 10.

THE NEW ENGLAND FARMER.

AGRICULTURAL.

SECOND REPORT OF THE AGRICULTURE OF MASSACHUSETTS.

BY REV. HENRY COLMAN.

As many of our readers may not have in their possession the second report of the agricultural commissioner, and as it contains much important and interesting information, we shall in the absence of Mr Colman, give from week to week extracts from it, which will no doubt be read with interest and profit by every intelligent farmer. J. B.

CROPS.

The crops in Berkshire are those cultivated in other parts of the State, and consist of the usual grasses, herds grass, red top, and clover. Of grains, Indian corn, wheat, barley, rye and oats; and of esculent vegetables, potatoes, carrots, ruta baga, mangel wurtzel, and common white turnip. In addition to these, buckwheat is raised to a considerable extent, some small amount of flax, and comparatively large amounts of teasels. The cultivation of hops was at one time attended to in some places; but is abandoned on account of the low price. Large amounts of rye have heretofore been used for distillation; but this is now pursued to a small extent.

Indian corn, the great grain crop of New England, with the exception of the two cold years, 1836 and 1837, has been always raised in the favorable locations in Berkshire with advantage. In some towns, however, the high prices obtained for wool induced the farmers to abandon entirely the growing of grain for bread, and devote their farms to the sheep husbandry.

Of corn, large crops have been frequently raised. In one of the hill towns, more than one hundred

expenses of cultivating any crops, it will be understood, that a man's labor has always been estimated at one dollar per day; and the same for a yoke of oxen, and half a dollar for a horse. In many parts of the country this, undoubtedly, is an over-estimate of the price of labor; but it seemed necessary to fix some price as a uniform standard throughout the State; and in the cost of labor involved in the production of any crop, one dollar is to be considered as the representative of a day's work. The prices of labor and the prices of board vary in different parts of the State. The estimated price includes both labor and board.

Expenses of cultivating an acre of corn in Sheffield, Mass.

Ploughing	\$1 50
Manuring, 15 loads, at 50 cents, half the manure to be charged to the corn	3 75
Getting out manure \$2; planting \$1 25; seed 25c.	3 50
Hoeing twice \$2; gathering and husking \$2 1 00	4 100
Interest on land at \$50 per acre	3 00
	<hr/> \$15 75

Product.

Corn stalks for fodder, equal to 3-4 ton of hay	\$5 00
45 bushels of corn, at 75c.	33 75
	<hr/> \$38 75
Profit on the corn	\$23 00

Estimated expenses of an acre of Potatoes.

Ploughing	\$1 50
Manuring as per corn, \$3 75; hoeing \$4,	7 75
Digging the crop \$12; interest on land \$3,	15 00
Seed, 15 bushels	3 75

two acres the crop amounted to 40 bu. 20 qts. The mode of cultivation pursued by this farmer is somewhat peculiar. The land on which this crop was obtained, was the preceding year in corn; and the corn crop planted on an inverted green sward. Some of this field was manured in the hill; and on some of it the manure was spread at the rate of twenty common cartloads to the acre. There was not a remarkable difference between the appearance of that part of the corn crop manured in the hill, or that on which the manure was spread. A circumstance, to which the attention of farmers is particularly invited, is that in cultivating the corn, in hoeing and harrowing, particular care was taken not to turn up or break the sod from the bottom. I shall now quote from the account given by this intelligent cultivator:

"About the 15th of April the corn hills were split with the common harrow, and ploughed once with great care. A thin coat of barn manure was spread. The manure was principally fresh horse manure. After sowing and dragging, leached ashes were spread over that part of the field not manured. Six bushels of clean seed were sown, after having been prepared by soaking in brine from 24 to 48 hours, and rolled in finely slacked lime, care being taken to have as much as possible adhere to the kernel. Care was taken to cover the wheat sown before it became dry. After sowing, the ground was dragged (harrowed) every day for five or six days, alternately crossing the field in opposite directions. Dry light soils are greatly benefited by working them while the dew is on. Heavy soils, however, should be thoroughly warmed and dried previously to working them. When the blade was up two or three inches, a good dressing of plaster was given."

Entire expenses of cultivation.

I subjoin from another enterprising cultivator, whose whole management in respect to cultivation and stock is entitled to high commendation, an exact account of a crop of ruta бага and flat turnips in 1837.

The charges for preparing, cultivating, gathering, and the product of 3 acres ruta бага and English turnips are as follows:

April 21 and 22—2 days man and horse team first ploughing 2,	\$4 00
June 5 and 6—2 days man and horse team second ploughing 2,	4 00
“ 6 to 9—3 teams and 3 hands 3 days each making 9 days, drawing on 64 loads manure, 1 50	13 50
“ 10—2 men spreading manure, 1,	2 00
“ —1 day man and horse team harrowing 2 00	2 00
“ —1 day man and horse ridging 1 50	1 50
“ —1 day man sowing 1 00	1 00
“ —1 1-2 lbs. seed at the price I sold seed, 1 00,	1 50
	\$20 50
July 5 and 6—8 days' labor hoeing and thinning, 1 00,	\$8 00
“ 12 and 13—8 days' labor hoeing and thinning, 1 00,	8 00
	\$16 00
Oct. 16 to 18—18 days' labor engaged for gathering, and 3 teams each 3 days, drawing, at 75c.	\$20 25
Cr. Deduct for tops, \$2 per acre	8 00
	\$12 25
	\$57 75

The quantity gathered from 1st and 2d acres	1600 bush.
3d acre	1080 “
4th “	900 “
	3580 bu.
less than 2 cts. per bu.	
If the interest on land were charged at \$40 per acre	9 60
And the manure at its value, (a compost of muck and stable)	32 00
	41 60
	\$99 35

The turnips would cost not far from 2 3-4 cts. per bush.—\$98 45.

He adds—“From my own observation much depends on having the land for the turnip crop, as also all root crops, potatoes excepted, mellow; they ought to be hoed at least three times, and oftener if the crop will admit of it. My crop of 1836, was hoed three times in the month of July, the ground was kept light until the tops covered it.”

I annex to this the statement of a crop of ruta бага, in Great Barrington, from another farmer, whose agriculture shows his industry and skill.

The amount of land was 1 acre and 20 rods—the amount of product well cleaned roots, was 46,495 lbs.

The land on which they were raised was green sward, and ploughed the last days in April, 1837. It had had no manure for three years preceding; it then received a thorough harrowing; it remained until the first of June; then harrowed it again smooth, and drew on 30 loads short barn manure; principally the manure of sheep, which is deemed preferable to any other for this root; this was spread

and harrowed until it was thoroughly incorporated with the soil; it was then with a plough thrown into ridges 24 inches apart. It was then sowed on the 24th of June, which was ten days after the proper season for sowing; when well out of the ground, they were plastered at the rate of one bushel to the acre; they were then ploughed and hoed twice. In cultivating them great care should be taken to have them stand 24 inches apart between the rows; and the plants 6 or 8 inches from each other in the rows.

From Lanesboro' the subjoined return was obtained from a farmer whose whole establishment is a model of neat and exact husbandry; in neatness and carefulness, perhaps no where surpassed.

Ploughing 2 doll.; seed 1-2 bu. 50 cts.	\$2 50
Manure, 20 cartloads, 1-3 of the cord to a load, 50 cts., half to be charged to the corn	5 00
Getting out manure 3 doll.	3 00
Planting 3 feet square, 1 50; hoeing 3 times	7 50
Cutting up and gathering 2 doll.; husking 2;	4 00
Interest on land at \$40	2 40
	\$25 90

Product.

Corn fodder equal to 1 ton of hay	9 00
50 bushels corn	50 00
Pumpkins, 2 loads	2 00
	61 00
Profits on corn	\$35 10

This farmer is in the practice of occasionally planting potatoes among his corn. In this case he plants his corn 3 feet 6 inches apart in the rows, and a hill of potatoes between the hills of corn. In this way he frequently obtains 150 bu. potatoes upon an acre, and considers the crop of corn not much lessened on account of the potatoes. The injury to the corn is in this case rather a matter of judgment than of exact experiment; and therefore this conclusion is in my mind to be somewhat distrusted. Corn and potatoes planted in alternate rows, or one row of corn and two of potatoes, have succeeded well; and from two acres of corn and potatoes planted thus alternately, there is little doubt that more corn and more potatoes may be obtained than from two acres where the corn and the potatoes are planted separately. In cases of alternate planting, the corn has a great advantage in its exposure to the sun and air. In the case above mentioned the potatoes occasioned a very small diminution of the number of hills of corn on the land. Here the potatoes, which require particularly, coolness and moisture, obtained an advantage in being protected to a degree from the drought by the leaves of the corn. In all these cases, however, of mixed crops, and of multiplying plants upon the land, two things are to be remembered; the first, that they are always of more difficult cultivation; a potato crop is kept clean with much more difficulty than a corn crop, and the corn crop with potatoes intermixed with it, is kept clean with much more difficulty than when cultivated alone. The second thing to be remembered is, that the preparation of the land must correspond with the amount of vegetation grown upon it; and a great crop can be expected only from a soil abundantly enriched. The art of producing fire and warmth without fuel, or of sustaining either vegetable or animal life without nutriment, is not yet attained.

FLAX.

I recollect meeting with a few patches of flax. The crop on an excellent farm in Sheffield gives usually about 400 pounds of flax, and 12 to 14 lbs. of seed; and it may be cultivated on the same land once in four or five years. Under such circumstances, it is deemed a profitable crop. Farmers have yet to learn the great value of flax seed made into jelly, in fattening cattle. No substance of the same bulk and expense within my knowledge, is so fattening for neat cattle and sheep.

DAIRY HUSBANDRY.

I proceed to speak now of another of the great interests of the agriculture of Berkshire—the dairy. The dairy business has always been a great business. For a time it gave way to the raising of fine wool, when the prices of that staple were high. Since the abatement of the demand for wool, with that caprice for which mankind always have been, and there is reason to think always will be remarkable, many farmers have sacrificed their flocks, and are now giving their exclusive attention to the dairy husbandry. These changes, in matters so important as the dairy or the sheep husbandry, involving, as they do, a considerable investment of capital, and many expensive fixtures, cannot be suddenly or frequently made without risk of serious loss and disadvantage.

The county of Berkshire is admirably adapted to the dairy husbandry. Grass is everywhere abundant. The soil is suited to the cultivation of esculent vegetables in the highest perfection. Several increasing manufacturing villages, with their swarming population, require supplies from the farms in the vicinity. Besides this, the great mart of the country, the city of New York, is easily accessible. Most of the farmers in Berkshire can reach Hudson with their produce, by a journey of four or eight hours, and put on board the boats at 4 o'clock, p. m., it is in New York by an early hour the next morning. The farmer usually allows two cents a pound commission for the freight and sale of his butter; and, upon other produce, it is equally reasonable. He does not return from the river empty; but carries home a load of plaster, or of articles of necessity for his family. The great roads to the river, after the hills are surmounted, are among the best in the whole country. The railroad already open from Hudson to West Stockbridge, will afford to many of the farmers all the facilities they can desire for reaching the Hudson river.

(To be continued.)

Salt should be regularly fed to cattle both in winter and summer. They will never eat too much if it is placed constantly before them where they can obtain it at all times. The best way to feed them with it, except when snow is on the ground, is to employ salt troughs for the purpose, which are made most convenient by making a deep cavity in the convex side of a short thick piece of slab, or a chip from scoring timber, to be kept filled with salt, and placed flat upon the ground. They are very cheap and will not easily upset. In winter when the ground is covered with snow, salt should be applied by brining the fodder.—*Farmer's Cabinet.*

They are sifting the land of Missouri for gold—they would find it sooner by planting the land with seed.—*Daily Times.*

PREMIUM LIST

Of the Massachusetts Society for Promoting Agriculture—1839.

(Concluded.)

BUTTER AND CHEESE.

- For the best lot in tubs, pots or firkins, not less than 300 pounds \$100
 For the next best, not less than 300 pounds 50
 For the best, less than 300 pounds, and not less than 100 pounds, 30
 For the best lot of cheese, not less than one year old and not less in quantity than 300 pounds 50
 For the best lot of cheese, less than one year old and not less in quantity than 300 lbs. 30
 The claimant for the several premiums on butter to be exhibited in the month of December next, must state in writing the following particulars, viz: the number of cows kept on his farm; his mode of keeping; the treatment of the milk and cream before churning; the mode of churning, winter and summer; the measures adopted to express the butter milk; the quantity and sort of salt employed, whether saltpetre, or any other substances have been used in the process; the best time for churning and keeping butter in hot weather, and the best mode of preserving it in and through the summer and winter, and in what vessels.

The claimants for the several premiums on cheese must state the mode of making the same, and the following particulars, viz: the number of cows kept; whether the cheese is made from the proceeds of one, two, or more milkings; whether any addition is made of cream; the quantity and sort of salt used, and the quantity of rennet; the mode of pressure and the treatment of the cheese afterwards.

Farmers in the several States are invited to compete for these premiums at the exhibition in December.

Claims for the premiums on butter and cheese last above mentioned, must be made in writing addressed to Benjamin Guild, Esq., Boston, post paid, on or before the first of December next; and the parcels deposited before Tuesday the 3d, at a place

ROTATION OF CROPS.

For the best rotation of crops on the same land, not less than two acres, for three or four years in succession, commencing when it is in grass \$75
 Premium to be claimed in December, 1839 or 1840.

It is expected the applicant will state the quality and condition of the land, when he first ploughs or breaks it up; the manner of preparing it each year, specifying the times of ploughing, the quantity and kind of manure used; the seed, whether potatoes, Indian corn, or other grain, planted or sown, and the kind and quantity of grass seed, the time when sowed, and whether with grain or alone, and the quantity of produce each year, including the last. The applicant's own statement, signed, but not sworn to, is all that will be required.

MIXED OR COMPOST MANURE.

For a compost of stable manure and meadow or pondhole mud or muck, with or without lime, as the applicant pleases, which, with the smallest portion of stable manure and lime, if used, shall approach nearest to clear stable manure, in strength and efficacy in producing crops \$50

Premium to be claimed in December, 1839.

In order to test the comparative strength and efficacy of the barn manure and the compost, it is proposed that a piece of land not less than an acre, shall be prepared in the same manner, and divided in equal halves for quantity and quality, and that stable manure shall be used on one-half, and compost in the same manner on the other, and that corn or potatoes shall be planted in each, and that both shall be ploughed, hoed, and treated in every respect alike, and an accurate account of the quantity and quality of the crop on each shall be kept, and that the claimant of the premium, in his application, shall state that he has proceeded in the manner above described, and the result. If lime is used, the quantity and quality, whether slacked or not slacked, must be stated. A statement signed by himself and one other reputable person, not un-

which shall be manufactured into sugar in the year 1839, giving a particular account of the soil, and his manner of sowing, cultivating, and gathering the beets, a premium of \$100

To the person, persons, or corporation, who shall manufacture from the sugar beet, sugar in the greatest quantity and of the best quality in the year 1839, giving a full and particular account of the process of manufacturing it, a premium of 100

For the greatest quantity of vegetables, (grain, peas, beans excepted) for home consumption and not for sale; raised for the keeping of stock, regard being had to the size of the farm in proportion to the crop, and to the number of stock kept, and also the respective value of the vegetables as food, and the expense of raising the same 30

For the greatest quantity of Indian corn on an acre, not less than 80 bushels (75 lbs. in the ear to be considered a bushel,) 30

For the greatest quantity of wheat on an acre not less than 25 bushels 20

For the greatest quantity of barley on an acre not less than 15 bushels 20

For the greatest quantity of rye on an acre, not less than 30 bushels 20

For the greatest quantity of dry peas, either broad cast or in drills, on an acre 25

For the greatest quantity of dry beans not less than 10 bushels on an acre 25

For the greatest quantity of mustard seed 30

For the greatest quantity of dressed flax, not less than 500 lbs. from an acre 20

For the greatest quantity and best quality of hemp on an acre 40

It is to be understood that the quantity of land specified above, is in each case to be in one piece. And the claimant of any of the above premiums, shall, with one other person, make a statement according to the best of their knowledge and belief, to the following particulars, and shall obtain a certificate of the measurement of the land by some sworn surveyor.

The particulars are—

The quantity of land in the spring of 1839

- To the person who shall construct and introduce for the use of farmers, the best subsoil plough 8:30
- For any newly invented agricultural implement or machine superior to any designed for the same use, a reward not exceeding twenty dollars, according to the importance of the invention 20
- To the person who shall prove to the satisfaction of the Trustees that his mode of rearing, feeding and fattening neat cattle is best 20
- For the greatest quantity of raw unmanufactured silk, not less than ten pounds, raised by the claimant and presented before the first of December, 1839 20

TREES AND LIVE HEDGES.

- For the best plantation of white oak trees, not less than one acre, nor fewer than 1000 trees per acre, raised from the acorn, not less than three years old, and which shall be in the most thriving state on the first day of September, 1839 50
- For the best plantation not before offered for premium, of white ash, larch and yellow locust trees, each not less than one acre, nor fewer than 1000 trees per acre, to be raised from the seeds, and which trees not less than three years old, shall be in the most flourishing condition on the first of September, 1839 25
- For the best live hedge, not less than 50 rods, and which shall be in the most thriving state in 1839 30
- To the person who shall offer the best communication on the mulberry tree in relation to silk culture, showing by experiments or otherwise, how to be most advantageously managed, what species is best suited to our climate—the effect of the winter thereon, and if injurious, the best remedy therefor 50
- Claims for the best plantation of trees above mentioned, together with the proper evidence, must be delivered to *Benjamin Guild, Esq.*, in Boston, free of expense, on or before the first day of January, 1840.

Claims for the premiums on vegetable and grain crops, and experiments and inventions, together with the evidences required, are to be in writing, and sent free of expense, to *Benjamin Guild, Esq.*, in Boston, Assistant Recording Secretary, on or before the first day of December next, and they will be examined by the committee previous to the 5th day of December.

It is understood that whenever merely from want of competition, any of the claimants may be considered entitled to the premium under a liberal construction, yet, if in the opinion of the judges, the object so offered is not deserving of any reward, the judges shall have a right to reject such claims.

Persons to whom premiums shall be awarded, may, at their option, have an article of plate with suitable inscriptions, in lieu of the money.

In cases where pecuniary premiums are offered, the Trustees may, having regard to the circumstances of the competitors, award either the Society's gold or silver medals in lieu of the pecuniary premium annexed to the several articles.

That if any competitor for any of the Society's premiums shall be discovered to have used any disingenuous measures, by which the objects of the

Society have been defeated, such person shall not only forfeit the premiums which may have been awarded to him, but be rendered incapable of being ever after a competitor for any of the Society's premiums.

Time of paying Premiums.—The Treasurer will attend on Thursday, the 5th of December, at 12 M. to pay all premiums awarded.

All premiums not demanded within six months after they shall have been awarded, shall be deemed to have been generously given to aid the funds of the Society.

By order of the Trustees,

PETER C. BROOKS,	} <i>Committee.</i>

June, 1839.

[For the New England Farmer.]

THOUGHTS AND OBSERVATIONS ON MATTERS AND THINGS RELATIVE TO THE FARMING INTEREST.

Mr Colman—Sir: To while away the tedium of a rainy day, (of which we have had a superabundance this season,) I have committed to paper a few thoughts and observations on matters and things relative to the farming interest, which if you think they contain enough to warrant an insertion in your paper, they are at your service.

Much has been written and published within a year or two past, from New Orleans to Maine, in the different newspapers, in attempting to account for the high prices of provisions, the almost universal dislike of the rising generation to follow the honest, healthy and independent business of farming, and their overweening anxiety to get a living in some other way than by the sweat of the brow—by resorting to the more uncertain and vexatious pursuits of the learned professions, trade, manufactures and speculation. There has been a combination of causes that has produced this state of things. That there has been a very great change in the business pursuits of a large mass of the population in the New England States within the last twenty-five years, is well known to every man. The immense increase of manufactures of cotton and woollen cloth, of paper, castings, and every species of manufactures and mechanical business all through the country, has given an entire new aspect to rural matters, and perhaps upon no class has this new state of things had a greater effect than upon farmers and their sons.

I shall attempt to show what *was* the state of things here in the interior of the State of New Hampshire, and what they now are and have been for some years past. Formerly, most farmers hired from one to three or more laborers, from 7 to 10 dollars per month, for 7 or 8 months, and the surplus laborers, (and many times in droves,) with their long smock frocks wrought into knapsacks, left the country *on foot*, for the seaports and lower towns in pursuit of farm work: in autumn they returned on foot, with their hard earnings carefully saved, and put out at interest, there to accumulate till they could earn sufficient to purchase a tract of land to commence making a farm; that was their aim and ambition; but now, few, very few go for employment on farms, but vast many take the stages for some of the manufacturing places, to get employment in and about them, and to the cities, to escape

the hard labor and drudgery of farm work;—occasionally they visit their homes in the country, dressed in fashionable style, giving the *young natives* glowing descriptions of a city life and its pleasures and amusements. This renders them uneasy and discontented—the quiet of a farm life is dull music to them—they in turn want to be off. They look around them, and although they have been told a hundred times that agriculture is the oldest and most honorable profession, and that farmers are the bone and muscle of our great republic, they can see but little honor attached to the profession, and as to bones and muscle, they know too, that they can be made to ache by the building of wall, pitching hay, &c.

The farmers say they cannot pay the wages asked by laborers, or that they can obtain in other employments—therefore cultivate less land, give up the dairy and pork business, and keep large flocks of sheep—consequently all kinds of provisions are from 50 to 100 per cent. higher than formerly, so that the surplus that a farmer may have to spare, will bring twice as much money, while most manufactured and imported articles he purchases, are 50 or 100 per cent. less, which enables him to lay up as much or more than he did with two or three times the labor. That farmers in the country have made money within the last few years, was brought to light during the pressure of 1837—not by any outward show of improvement, either of houses or furniture, horses or carriages, or any visible extravagance, but by the failures of country traders, speculators, dashing mechanics, &c., &c. When the crash came, then it was found out that many, very many farmers had money at interest, that were hardly thought to be even with the world;—it was for the interest of both lender and borrower to “*keep dark*”—one to avoid being taxed for money at interest, the other to keep up his credit. These farmers, many of them, had worked hard, fared hard, for the sake of having money at interest, trusted it to the *dashall* family and lost it, which made the whole case very *hard*.

I know farmers that lay up from one to five hundred dollars per annum, and not very great farmers neither; they either loan it out at six per cent. or buy lands they do not need, or get it in specie and lock it up; but I think there are ways in which a farmer can vest his surplus, better than the above, where he need not fear the loss of the principal, and be sure of good interest. Suppose a farmer at the end of the year has saved two hundred dollars, has a family of children growing up to men's estate, has a comfortable farm house, but neither painted inside or out—there is no door yard in front, nor shrubbery or shade trees about it, nor garden worthy of the name—no other fruit than common apples, few books in the library, and no interesting periodical taken. The children of such farmers have eyes that can see, feelings that can be gratified or wounded; they can contrast their cheerless looking houses and out buildings with those of the professional man, traders, industrious and prudent mechanics, and they see about these situations an air of neatness, comfort and elegance they do not possess: home has but few attractions. Now if this farmer would expend 100 dollars towards repairing and painting his house, ornamenting his yard with shrubbery and choice fruit trees, even if he had to send 60 or 80 miles to Winship's or Kenrick's for his trees, buy a few good agricultural books, subscribe for the *N. E. Farmer*, with your weekly lectures to spur him on to “*improve-*

ment," it would have a wonderful effect upon his children—it would cause them to hold up their heads and to sing, "There's no place like home." The other 100 dollars lay out in part for first rate tools, such as the best cast iron ploughs, cultivator, cast steel shovels, hoes, scythes, &c., &c., not forgetting "Partridge's manure fork." Fifty dollars will go some ways in buying tools; the increased ease and facility with which the boys can work with such tools, will render it rather a pleasure than otherwise to labor. The other fifty dollars may be most profitably expended in making a compost manure heap—or suppose the farmer is going to turn over three acres of greensward this fall—the practice of this is to do their breaking up in the autumn—let him go to his wood lot and scrape up 40 cartloads of decaying leaves, twigs and vegetable mould, and cart on to the acre and turn it beneath the sod—then to his swamp, and cart on 40 loads to the acre and spread upon the furrow, that the winter frost may break it down—next spring apply his manure, and his following *citra* crops for a series of years on his three acres, with the increased value of the land, would more than pay the interest of the 200 dollars. This course would be bringing the land back into its original state, in some measure as it was when the forest was first cleared off, and partially returning the vegetable matter that then made it so productive. Why, Mr Editor, did you never notice in the vicinity of where an old farm house had once stood, what swarths of grass, what crops of corn and potatoes the land would yield where the wood pile used to be chopped, and the chips had rotted down to vegetable mould? If you never did, call upon me, and I will show you many such spots—yes, and I will also show you a spot that once was occupied by a tan yard, and a large tract covered to a great depth with henlock tan, which for 12 or 15 years past, has produced large crops of corn and potatoes that would compete with the famed crops of the west, without manure, except what the decaying vegetable matter of the bark afforded.

B.

republican doctrines, in all legislatures of which they are members. The only misfortune is, that they are not elected to fill our legislatures or to constitute a majority of them.

If I am not greatly mistaken, one of the principal sources of the civil and political evils we suffer is in making the profession of law so much the channel to offices of emolument and honor. The practice presents an inconsistency on the very face of it. It is evidently inconsistent, and highly improper, that one class of men should institute laws, expound laws, and execute laws, which it may be supposed they will do to promote their interests, while that class constitutes a very small minority of the community, though there are ten times, and probably fifty times as many as the most healthy state of the community requires. The greatly increased, the rapidly increasing, and the largely disproportionate number of our citizens who resort to the law for a profession, is probably not the least evil resulting from appointing so many of this profession to places of honor and trust.

Without any prejudice against the members of this profession as individuals, for by an extensive acquaintance with them, I know many of them to be honorable and respectable men, I am convinced, as they themselves will undoubtedly acknowledge, that a large number of lawyers promote litigation. And no one will pretend that extensive litigation is favorable, either to the pecuniary, the moral or social health and prosperity of the community, but highly destructive to all. Consequently any arrangements or measures adopted for conducting the operations of society which have a tendency to increase the number of lawyers, which is already entirely out of proportion with that of other classes of the community, must do an injury to that community. And appointing them to fill the seats in our legislatures, especially the chair of state and the highest seat in the nation, must do a double and an irreparable injury: it produces bad laws, and investigates quarrels and contentions in the observance and executing of those laws.

To avoid these evils, and as far as possible, to repair the injury already done by the inconsistent

sounder and safer men to be relied upon, and because by neglecting to fill our offices from the profession of law, the number engaged in that profession might be diminished, and litigation diminished with it; and by that means the wealth, the intelligence and the virtue of our republic greatly promoted.

If the education of farmers was what a rational and an enlightened system would make it, at a less expense of time and money than is now incurred for the purpose, they would be entirely qualified to perform many kinds of business, for which they now resort to the legal profession; such as drawing contracts, giving power of attorney, making out bills of sale, conveying property by deed or otherwise, and various other acts of a similar character, which would save themselves great expense and trouble, and permit lawyers to engage in pursuits better calculated to promote the health of society.

To avoid the evils and secure the benefits here referred to, no one need to act under the influence of prejudice or desire of proscription. Farmers and mechanics have simply to select and appoint individuals from their own professions to promote their interests and to secure and protect their rights, and they can hardly fail to accomplish their object.

I remain Yours,

Truly and always,

J. HOLBROOK.

Strawberries.—The following extract of a letter from Newton, Mass., is worth recording, as one of the best fruit stories of this fruitful season. After referring to the Jersey story of 240 dollars worth of strawberries being raised from one acre of ground, which story is travelling the rounds of the newspapers, he says—"To recall our friend E. to regions he was once familiar with, we will state their productions in one particular, that old New England may not be forgotten. On a patch of 1800 square feet, being less than one-twentyfourth of an acre, a neighbor of ours raised the last season, 120 quarts of strawberries, which, at 25 cents the quart, the Boston *pr.* would have produced 30 dollars, and at 20 *pr.* would have produced 24 dollars. Twentyfive quarts

PROFITS OF FARMING.

Much discussion and conversation have been had upon this subject. We do not mean to enter fully or much at large upon a subject which requires to be examined in various aspects and relations, in order that an enlightened and well-founded judgment may be made up; and especially in order that we may not lead to any false inferences of its unprofitableness, nor encourage any fallacious expectations as to any advantages, (we mean pecuniary advantages,) to be derived from it. The erroneous opinions and calculations which have been formed in this matter, have led to most painful results, to serious losses, and to bitter and vexatious disappointments. We know a gentleman who tried farming on an extensive and experimental scale, whose authority is often quoted as asserting that "in agriculture two and two do not make four." We understand it to be implied in this, that calculations respecting the profitable results of agriculture, or a fair return for the expenditure of labor and the investment of capital, are not likely to be verified as in the other business pursuits of life. We do not admit the axiom in any fair sense. We do not believe that it does justice to agriculture; and no small experience and some observation satisfy us, that circumstances being equal, farming would furnish as fair a compensation for labor, and as ample a dividend upon the capital invested, as the common trades which men engage in, and even the pursuits of mercantile and commercial life. Of course we except all extraordinary cases of good fortune, and all matters of gambling and speculation.

The returns of most crops strike one sometimes with astonishment; and would, if taken as a test, lead to the most delusive expectations. A grain of seed sometimes returns one hundred fold; and this being sown a second year, would perhaps give ten thousand fold, and so on in a geometrical ratio. Twenty bushels of potatoes planted will frequently yield four hundred bushels, that is twenty for one. A bushel of wheat sown oftentimes returns thirty bushels. A peck of Indian corn planted will often produce sixty bushels, that is two hundred and forty for one. A pound of carrot seed or of ruta baga, which costs a dollar, will produce six or nine hundred bushels of roots worth one hundred dollars. The proceeds in this case seem enormous and yet they are constantly realized, and often, it must be admitted, at a comparatively small expense. But no confident conclusions on the profits of farming are to be drawn from such results as these. So many circumstances of abatement enter into the case, that if these are the only elements given in the case, the solution of the problem would give the most egregiously erroneous and deceptive results.

We are not to look to agriculture for any extraordinary or sudden gains, as for example, like drawing the capital prize in a lottery where there are two blanks to a prize; like some successful East India voyage, where the sale of the cargo yields a net profit of one hundred per cent; or like some sudden rise in the stocks, or some monopolized article of produce, where a shrewd operation draws its thousands or twenties of thousands into our pockets. But that skill, experience, assiduity, and industry will, in agriculture, yield a fair, and to a reasonable mind, an ample compensation, there are too many and reiterated proofs to admit even of a doubt.

As we said in the beginning, we do not design at this

time to go largely into this subject, and we refer to it in particular at this time, for the sake of relating some parts of a conversation which we once had with a respectable and independent but complaining farmer in our own despised State.

This man then had a farm which was fully valued at four thousand dollars. The father, who had given the farm to the son, had begun life without a dollar, had run into debt for a large part of the purchase money, but had some time since, while he supported his family, earned from the proceeds of the farm, sufficient to pay for it. Without any incumbrance he had then put it into his son's possession, and now lived with him under the same roof.

Said the son, Farming is a miserable business!

But why so? Let us look into this matter. What is the estimated value of your farm?

Four thousand dollars.

Is it increasing in value?

Yes; by its favorable location, and by every improvement that is made upon it.

Do you get all the produce from it which it can be made to yield?

No, not one-third. It consists of one hundred and twenty acres. At least fifty acres of it are in wood, and a considerable portion in pasture. Besides that, I have several acres of peat bog, which might be redeemed and brought into English grasses.

What is the value of the wood land?

We supply our family with fuel, and besides this the growth of the wood and the hoop poles which we obtain from it, pays a large interest upon the current value of the land, so that we consider this as one of the most profitable parts of the farm.

Have you done anything to improve your pasture lands?

No—I suppose I ought to. I tried one hundred weight of plaster spread upon a part of it, and the effects were visible as far as the land could be seen; but then after that, plaster rose half a dollar on a ton, and I thought I would not get any more. Then the huckleberry bushes and the sweet fern, and the brakes and alders have come in so that I cannot keep as much stock as I could formerly.

Have you attempted any improvement upon your bog meadows?

No—sometimes I have thought I would. My neighbor J. B. has redeemed eight or ten acres, and now gets two tons and a half of hay to the acre, herds grass and clover and red top of the best quality, where formerly he got scarcely any thing; but then it cost him at least twenty or twenty-five dollars an acre to drain and manure it; and he will have to top dress it at least once in five years or it will never hold out. Then, too, he has put on at least half a bushel or more of grass seed to the acre; and grass seed which I used to buy for twelve cents a pound or two dollars and a half per bushel, is now twenty cents a pound, and herds grass three dollars per bushel. Then too, labor is so high, I cannot afford to hire.

Have you plenty of manure?

No; that is a great want. I have a bog hole where I suppose I could get two hundred loads a year, but then I should have to go more than a mile for it, and it is wet work. I have not any of the advantages which the farmers have who live within six or seven miles of Boston, and can go in and buy a load of good dung whenever they want.

Do you know what these farmers have to pay for manure in Boston?

Why, yes! I have been told they have to give sometimes three to five dollars a cord at the stables. Some-

times our tavern keeper sells a few loads, but he asks five dollars a cord.

Have you a barn cellar?

No. I have often thought it would be a very good thing, and my barn is well situated for one; but then it would cost, besides what work I should do with my own team, full fifty dollars to make one.

Do you keep cows?

Yes, I keep some just to eat up our coarse fodder; but our women folks do not like dairy work, so we buy our butter and sell our milk to the milk-man for eleven cents a gallon.

Do you keep swine?

Only one or two for our own pork. We do not have any skim milk or butter-milk for them. Besides there is no great profit in fattening hogs. They will not much more than pay for what feed they will eat. I know they will make a large quantity of manure, but then you must cart in a great deal of stuff into their pens or else they can't make any. But come! I must show you a sow I have got: she is only fifteen months old, and I sold her pigs for more than forty dollars. I suppose I shall make her weigh four hundred in the fall!

Do you raise your own grain and potatoes?

Not all. I raise about three acres of corn and about as much rye, and about six hundred bushels of potatoes. We sell my hay, and buy Genesee flour. We have tried wheat, but sometimes it is blasted; and it don't make white flour; and our women folks say they cannot make handsome pie-crust or white bread with it.

How many have you in your family?

I have a wife and eight children, and my father lives with me.

Have you any trade?

No; I have nothing but my farm.

Does your farm support your family and pay your labor?

Why, yes! I have nothing else, excepting a little interest that comes from some money which I received for the sale of wood from the farm, sometime ago, which came to about five hundred dollars, and which I put out at interest. We sell enough produce from the farm to pay our hired labor, which costs about a hundred dollars per year, and our store bills and taxes.

We have very much abridged this conversation, and we shall leave it without farther comment. But here is a husbandman on a farm valued at four thousand dollars, not producing more than one-third of what it might be made to produce, yet supporting a family of eleven persons and paying all expenses, excepting the labor and superintendence of one man, and the farm gradually increasing in value by every expenditure, however small, for its improvement; this man too, not working half the time, and he and his family living in the enjoyment of all the luxuries, if they choose to have them, which they can reasonably ask. Let such a man if he will, take his two hundred and forty dollars income and labor no more hours than he does in the country, and go into Boston and try to support his family there. The end of the year would show him a result which would make him ashamed to complain of his present condition. His whole money income of two hundred and forty dollars would scarcely pay for his fuel, his taxes, and the rent of a ten-footer. What an evil it is that our farmers do not know their blessings! H. C.

Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, July 20, 1839.

The general display of Flowers was very good; but the Carnation show did not meet our expectations. We understand from some of our friends that their specimens were not yet in bloom; while others informed us

hat theirs were on the decline. So far as our own observation extends, we are under the impression that the bloom of the Carnation has been very defective. We herewith submit the report of the Committee appointed to award the premiums on Carnations. The contributors were Messrs Mason, Meller, Winship, Johnson, Carter, Jno. Hovey, Miss Sumner, and Sam'l Walker.

"The Committee appointed to award the premiums on Carnations, have attended to that duty and report as follows:

For the best display of Carnations a premium of \$5 to Messrs Mason.

For the best 6 Carnations, a premium of \$3 to Wm. Meller.

For the best seedling Carnation, a premium of \$3 to Wm. Meller.

Signed,
C. M. HOVEY,
JOSEPH BRECK'

July 20th, 1839.

Bouquets and a variety of cut flowers from the garden Messrs Winship, of Brighton.

Dwarf Rocket and Neapolitan Larkspurs (fine) from Joseph Breck & Co.; also, Rocket Larkspurs of great utility, from Hovey & Co.

Native plants, by Wm. Oakes, Esq: *Goodyera repens*, *selepias obtusifolia*, *Vaccinium dumosum*, *Woodisia pensilv.*, *W. obtusa*, *Asplenium eburneum*, *A. trichomanes*, *Spidium marginale*, *Adiantum pedatum*, *Lycopodium nitidum*, *L. dendroideum*, do. var., *L. complanatum*, *Utricularia hispida*, and fruit; *Trifolium arvense* and *peumbens*, *Sarracenia purpurea*, *Xylosteum ciliatum*, fruit.

We were much pleased with a specimen of *Cactus Larkspur* in the collection of Messrs Winship.

For the Committee,
S. WALKER, *Chairman*.

COMMITTEE OF ARRANGEMENTS

For the Annual Exhibition of the Horticultural Society.

Samuel Walker, Isaac P. Davis, Thomas Lee, Wm. Ver, L. P. Grosvenor, Marshall P. Wilder, Edward Richards, John L. Russell, Wm. T. Eustis, Ezra Weston Jr, Rob't Treat Paine, J. E. Teschemacher, Benj. French, Samuel Downer, John Towne, Otis Johnson, David Haggerston, Wm. McLellan, Robert Manning, J. M. Ives, Charles M. Hovey, M. P. Sawyer, John Breck, Cheever Newhall, Wm Kenrick, John Winkler, Henry Sheaf, Ebenezer Putnam, Samuel R. Johnson, S. Sweetser, J. C. Howard, P. B. Hovey, J. L. L. S. Warren, Wm. E. Carter, John A. Kenrick, J. W. Swan, J. W. Russell, Rufus Howe, Samuel Pond, and the Committee are authorized to add to its number if desirable.

THERMOMETRICAL.

Reported to the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending July 21.

STRAWBERRIES.

Those who are desirous of cultivating this delicious fruit are respectfully informed that the subscriber has succeeded, after a number of years experimenting upon the *Strawberry*, not only in obtaining new varieties, but in ascertaining the best method of cultivation.

Specimens of the fruits grown in his Garden have been exhibited at the *Massachusetts Horticultural Society Rooms* the four past years, and are also too well known in *Pine Hill Market* to need a particular notice here.

He has for sale at his Garden in Brighton, Mass., the following *eight varieties of Plants*. They are of superior stock and quality, all warranted to be truly named and true from the mixtures often found in those offered for sale promiscuously.

Those who are in want of *Strawberry Plants*, are respectfully invited, and they will find it interesting, to call at the Garden and see the manner of cultivation. The method of cultivation, and any information desired will be cheerfully given.

The subscriber would state that from many years *personal experience*, he is satisfied that plantations of these vines made the last of July or early in August, by careful and constant attention will produce nearly or quite as much fruit the season following as those plantations made in the Spring will produce the second year.

Warren's Seedling Methren.—A new and valuable kind. A free bearer, fruit very large and juicy; fruit measuring four and a half inches have been exhibited the present season.

Methren Castle.—Fruit extremely large, high flavored, and showy. Specimens of this kind have been exhibited at the Horticultural Rooms for two years past, measuring five and a half inches in circumference.

Bath Scarlet.—Fruit large, full bearer, and beautiful scarlet.

Early Virginia.—This is considered the earliest fruit—a free bearer, hardy, and very early; decidedly a fine kind for market.

Royal Scarlet.—Fruit long oval shaped and juicy.

Hautbois.—Fruit smaller but very numerous.

English Wood.—Fruit well known.

Monthly.—Fruit is gathered from the vines from June to October, and in good quantity and fine quality.

Orders left at the Garden, or directed to the subscri-

MISCELLANEOUS.

WONDERS AND MURMURS.

BY MISS MALL.

Strange that the wind should be left so free
To play with a flower or tear a tree;
To range or ramble where'er it will,
And as it lists be fierce or still;
Above and around to breathe of life,
Or to mingle the earth and sky in strife;
Gently to whisper with mornin's light,
Yet to growl like a fretted fiend at night,
Or to love and cherish and bless to-day,
What to-morrow it ruthlessly rends away!

Strange that the sun should call into birth
All the fair flowers and fruits of earth,
Then bid them perish and see them die
While they cheer the soul and gladden the eye;
At morn its child is the prime of spring,
At night a shrivelled and loathsome thing;
'To-day there is hope and life in his breath,
To-morrow it shrinks to a useless death;
Strange doth it seem that the sun should joy
To give birth alone that it may destroy.

Strange that the ocean should come and go,
With its daily and nightly ebb and flow—
To bear on its placid breast at morn
The bark that ere night should be tempest-torn;
Or cherish it all the way it must roam,
To leave it a wreck within sight of home;
To smile as the mariner's toils are o'er,
Then wash the dead to his cottage door,
And gently ripple along the strand,
To watch the widow behold him land.

But stranger than all, that man should die
When his plans are formed and his hopes are high!
He walks a lord of the earth to-day,
And the morrow beholds him part of its clay;
He is born in sorrow and cradled in pain,
And for a youth to age it is labor in vain;
And all that seventy years can show,
Is that wealth is trouble, and wisdom wo;
That he treads a path of care and strife,
Who drinks the poisoned cup of life.

Alas! if we murmur at things like these,
Which reflection tells us are wise decrees—
That the wind is not ever a gentle breath—
That the sun is often the bearer of death—
That the ocean wave is not always still—
And that life is checkered with good and ill:
If we know 'tis well such change should be,
What do we learn from the things we see?
That an erring and sinning child of dust
Should not wonder nor murmur, but hope and trust.

SUICIDE OF A MATHEMATICAL MISER.

On Friday week, a coronor's inquest was held over the body of Jeremiah Hallett, of Yarmouth, who, on the 25th ult., killed himself by hanging.—The deceased lived alone, and was sixtyfour years of age the day the inquest was held. The deceased was a miser. To accumulate money he sacrificed all the comforts and conveniences of life, and even severed the natural ties of kindred. The getting of money and the mathematics were the two subjects which engrossed all his thoughts. In youth and till 25 years of age, he was employed in farming and the fisheries. When at school the mathematics absorbed all his thoughts, and though in after life he was engaged in school keeping, and

was once a member of the school committee of Yarmouth, he was on all subjects but one, a very ignorant man.

At 25, in consequence of over exertion, he lost, or imagined he had lost, his health. He went to Boston, and though extremely debilitated, he preferred walking twice from the north to the south end of the city to find Dr Rand, rather than pay for a carriage to carry him. By that physician's advice he was salivated, by which he lost most of his teeth. Though apparently well, he believed himself sick, and kept his room nineteen years, being rarely seen excepting by the members of his father's family. During this long period, he was almost constantly engaged in the study of the mathematics. The floor of his room was sanded, as the fashion in those times; this he would brush smooth, and mark thereon with his finger. The walls were also covered with figures and diagrams. After the decease of his father in 1819, he occasionally ventured out of the house, though he did not engage in any laborious employment, and was careful not to be seen by strangers.

For ten years he has lived a hermit's life. He was master and mistress of his own house, the doors of which he kept fastened, rarely admitting any one. His numerous relations and friends in this town are highly respectable and worthy, and have been unremitting in their labors and entreaties to induce him to change his course of life.

He had one elegant suit, which he occasionally wore, and his every day habiliments were as decent as are generally worn by laboring men. His charities never warmed the hearts of the poor. A relative who yet survives, and is in destitute circumstances, once went to him when pressed by want, for a few quarts of meal; but he turned her from him empty handed.

The deceased was a monomaniac. On all subjects save the getting and saving of money, he was of sane mind. He could not afford to marry.—Pride and avarice were with him antagonistic principles. He was desirous of concealing his real character from the world—and therefore occasionally affected, in dress and manners, the appearance of a finished gentleman. He was vain of his mathematical knowledge, as well he might be; for he had devoted more hours to the study of that science than perhaps any other man living. He was profoundly skilled in the science of numbers, and could boast of greater proficiency in the higher branches of mathematics, than any man in this part of the country. The readers of the old "Farmer's Almanac" will recollect his initials. He was engaged all the mathematical questions published in that annual, and has furnished for it many original problems to puzzle the brains of adepts in algebraic lore.

During the last months of his life he was much depressed in spirits, and at times in conversation exhibited decided evidences of insanity. He believed that the real estate had all been set off by execution for the payment of his father's debts, and that he should have to want. Those to whom he in confidence gave this information, could not undeceive him. He said they might go to the Register's office and satisfy themselves. He also averred that his woodland had been advertised in the newspapers, and sold at auction. He imagined that his relations were getting his other property from him, and while fully persuaded of the truth of this delusion, he committed suicide.

To trace the succession of steps by which he

descended from frugality to parsimony, and at last became emphatically a miser, would be a subject curious and instructive inquiry. Jeremiah Hall would have been indignant had he been called while living, a miser. Feeding on the coarse fare he called economy; sitting without fire while his wood was rotting in piles, was with him frugality; and using a shingle for the double purpose a fire shovel and bellows, was, in his view, a saving of expense.—*Yarmouth Register.*

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse with a boy to lead, will rake an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were of late but little known, although they have been in very general use in the southern and western States, for 20 years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle 1 acre in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street.
July 10.

FINE CALF FOR SALE.

A fine young heifer calf, from J. P. Cushing's celebrated bull. Enquire of JOSEPH BRECK & CO.

DURHAM SHORT HORN BULL.

For sale, a very fine Durham Short Horned Bull, 18 years old. For further particulars inquire at the New England Agricultural Warehouse.
Boston, June 12, 1839.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at 53 per ann payable at the end of the year—but those who pay will sixty days from the time of subscribing are entitled to a discount of 50 cents.

AGRICULTURAL.

SECOND REPORT OF THE AGRICULTURE OF MASSACHUSETTS.

BY REV. HENRY COLMAN.

(Continued.)

PRODUCE AND EXPENSES.

1. *Egremont*.—I will in this place state as an example, the operation of a farmer who resided about twenty-five miles from Hudson. The great object of his attention was the making of butter, which was sold every week in the New York market.

From 18 cows he sold 2400 lbs. butter, at 23 cts. net. With these cows he fed 17 spring pigs until October, whose average weight was 177 lbs. each; half of this pork, say 88 lbs. was to be credited to the cow. He is of opinion that when pork is \$10 per 100 lbs., a cow will give at least \$8 worth of pork per year.

Cow, Cr.

133 lbs. butter, at 23c. (commission paid,) \$30 59
Pork 8 00

\$38 59

Cow, Dr.

Wintering \$19 00
Pasturing 5 00
Salt 25
Interest on \$25, 10 per cent. risks included 2 50

\$19 75

Profits of a cow

\$18 84

It is understood that no extra feed is in this case given to the cow; and the butter and milk used in the family, it is supposed will fully pay for the attendance. This is a fair profit; but it is, as I think we shall presently see, much less than it should be. No animal is better entitled to good keeping than a cow; because none makes a more liberal return for all the extra kindness and feed and attention bestowed on her.

In another dairy, nine cows made 1550 lbs. of butter and 300 lbs. of cheese.

Another dairy of twenty cows produced, of butter 500 lbs.; of new milk cheese, 4000 lbs.

2. In *Olis*.—Twenty cows gave 5000 lbs. new milk cheese for sale; each averaging also 25 lbs. of butter; 600 lbs. of cheese were also used in the family.

Cow, Cr.

280 lbs. cheese at 8c. \$22 40
25 " butter at 20c. 5 00
Calf 4 00
Pork, 26 lbs. at 6c. 1 56

\$32 96

Cow, Dr.

Wintering \$12 00
Pasturing 5 00
Interest on cost of cow \$15—10 per cent. 1 50
Labor and attendance 2 16

20 66

Balance in favor of cow \$12 24

3. *Lanesboro*.—Sales from 12 cows: cheese at 12 cents—butter at 25 cents—gross amount, 600 dollars. No account in this case is made of supplies in the family.

4. *Sandisfield*.—The average yield of a cow in ordinary seasons is rated at 250 lbs., with common keeping. By extra keeping, the quantity is increased to 350 or 400 lbs. The quantity of butter in addition, to each cow, is supposed to be from 40 to 50 lbs. where new milk cheese is made.

The amount of cheese made in Sandisfield, in 1837, was estimated by a most competent authority at 300,000 lbs.

Another farmer, with a dairy of 15 cows, states the average product of a cow, if she raises her calf, at 250 lbs.; if otherwise, at 300 lbs.; and 25 lbs. butter also, from each cow. Four hogs may be kept to 20 cows. In this way, weighing 100 lbs. in the spring, they will weigh 300 lbs. in the fall.—140 lbs. of pork is to be credited to 5 cows.

The cost of wintering a cow here, is rated at \$10; pasturage \$4. A good dairy woman will take charge of thirty cows, with assistance in milking and in handling cheese. Her wages will be \$1 50 per week, with board.

5. In *Tyringham*, the average yield of a cow is reckoned at, new milk cheese, 222 lbs. 1 lb.

Supra, Dr.

Winter keeping \$12 00
One acre of land costing \$50 will pasture the cow 3 50
Salt 25 cents, 3 bs. bran \$3 3 25
Interest on the value of cow at \$25, 10 per cent. 2 50
Labor of milking, making butter, cheese, &c. 4 00

\$25 25

Balance in favor of the cow \$24 08

The quantity of land estimated for pasturage in this case seems small. It must be small for a general rule; another farmer in the same town assured me that he kept one yoke of oxen all the season and one horse half the season, on two and a half acres of land, which he showed me. The land had been greatly benefited by plaster.

EXTRAORDINARY COWS.

I shall give an account of some remarkable animals which have been found among what are called our native cattle. It is not pretended that they constitute a distinct race or characterize a particular class of animals; but they show at least what materials are within our reach, upon which to build a stock of high character.

A cow of Samuel D. Colt, of Pittsfield, from 1st December to 27th April, 148 days, produced 193 lbs. of butter.

A cow owned by R. Campbell, of Pittsfield, has yielded 26 beer quarts of milk per day.

A cow owned by Hloesa Merrill, gave 30 beer quarts of milk per day.

A cow owned by D. Fenn, of Stockbridge, 8 years old, produced in one week 12 lbs. 9 oz. butter. During the same time, 10 quarts of the milk were sold, and in addition cream and milk were used freely in the family.

A cow owned by Calvin Davis, 4 years old in the spring of 1838, in 172 days produced 225 lbs. butter, and fatted a calf. An accidental injury to the cow, prevented a continuance of making butter.

Two cows of Wm. Dewey, of Alford, in good season, averaged for a length of time, 14 pounds of butter each per week.

A cow belonging to the late Dr Hyde, of Stock-

The above is exclusive of 25 lbs. made while fattening three calves. He adds: "My method of keeping has been grass only, from spring to fall. In the fall I begin with pumpkins and potatoes, and feed moderately during the time she gives milk.—An account has been kept for only three years; but it would not vary much from the above, for the twelve seasons I have had her, except the present season she has been farrow." This cow is now 18 years old, "and will calve again about the middle of February."

Two cows owned in Pittsfield, produced each 50 lbs. of milk per day; and one other 32 lbs. at a milking.

A cow owned by Thomas Hodges, in North Adams, produced last year 425 lbs. of butter; 400 lbs. of this amount were made in nine months. Her feed consisted of one quart of rye meal and a half peck of potatoes per day, and very good pasturing.

To this list I will add the case of another cow in the neighboring county, whose product must be considered as quite extraordinary. She is owned by Joseph F. Upton, of Ashfield, Franklin county.

From the 1st of April, 1837, to the middle of February, 1838, her product was 335 lbs. 15 oz. From the 9th of May, 1838, to the 28th of December, 1838, she had produced 363 lbs. 3 oz. of butter, and was still making at the rate of one pound per day.

The owner adds: "In the year 1837, I killed my calf at three days old, and gave my cow the skimmed milk through the summer. I commenced the first of October to feed on potatoes. I gave her about one peck per day boiled, as long as she gave milk. In the year 1838, I fattened my calf and killed it at four weeks old. It weighed 75 pounds. She has had nothing but grass this year, until the first of October; since then I have fed her with one peck of boiled potatoes per day. My cow is seven years old last spring." Her winter-keep at present, while giving milk, is as much hay as she will eat, and one peck of boiled potatoes per day. These cows are all of native stock, without any admixture of foreign blood. The three cases of largest product certainly cannot be considered as examples of high feeding. It is extremely desirable that some skilful farmer should, by a judicious selection from such animals as these, endeavor to form an improved race for the dairy. I have already said that this has been attempted by one gentleman in the State.

Before I proceed to say what he has accomplished, I will mention an interesting fact, communicated to me by an observing farmer of Stockbridge.—Thirty-two years since, he became the possessor of a very productive cow; and has continued the breed to this day; she has never produced a bad milker, and some of her descendants, owned by other persons in the village, do equal credit to their parentage. The yield of one of them, which came within my knowledge, is twenty quarts per day.

DAIRY AND SOILING.

In Waltham, Middlesex county, a gentleman had four cows; but not a rod of ground which could be appropriated to pasturage. These animals were, therefore, never out of the barn or the barn-yard, and were fed with grass mown for them; with green corn fodder, which had been sown broadcast for this purpose; and with about three pints of meal each per day. The amount of their produce was kept for thirteen weeks. Two of these animals were heifers of two years old, who had

calves the same spring; and the whole milk of one of them was taken by her calf during six weeks out of the thirteen. Some of the milk of the other was taken for family use, but the quantity not determined. Under these circumstances, these heifers could not be rated as equal to more than one cow of full age and milk. From this stock, however, thus circumstanced and fed, 280 lbs of butter were made in the thirteen weeks. An additional pound would have given an average of thirty pounds a week for the whole time to a stock which must be in fattness, set down as three cows only. This experiment was made in 1837.

CARROTS.

Jeremiah Valet, late of Stockbridge, but now an emigrant to the fertile west, a true philosopher in a homely garb—a pure diamond, though never in the hands of the lapidary—(I would not say this if he were not out of the reach of my voice)—was much in the habit of raising carrots, and gave a preference to them over every other vegetable for fattening swine and cattle. This was the result of repeated trials and long experience. To fatten swine he gives them boiled—to store hogs, raw.—His crops average 800 bushels to the acre.

John Merrill, of South Lee, has been a very successful cultivator of carrots. He states the yield on two acres at 600 bushels to the acre; and the cost of cultivation, exclusive of manure and rent of land, at 25 dollars per acre, or a little more than four cents per bushel. For feeding horses, he says, he should prefer one hundred bushels of carrots and one hundred bushels of oats to two hundred bushels of oats. He applied them in a raw state to the feeding of his team horses, and horses in preparation for market; and they were kept by them in high health and spirits. Oats followed his carrot crop on the same ground with great success. The experience of J. C. Curwen, Eng., in the use of carrots for horses, corresponds with that of Mr Merrill. The authority of Curwen is unquestionable; and he was in the habit of employing constantly as many as eighty horses on his farm and in his extensive coal mines.

"I cannot omit," he says, "stating the great profit of carrots. I have found by the experience of the last two years, that where eight pounds of oat feeding was allowed to draft horses, four pounds might be taken away and supplied by an equal weight of carrots; and the health, spirit, and ability of the horses to do their work be perfectly as good as with the whole quantity of oats. With the drill-husbandry and proper attention, very good crops of carrots may be obtained upon soils not generally supposed suitable to their growth."

He adds in another place—"The profits and advantages of carrots are, in my opinion, greater than any other crop. This admirable root has, upon repeated and very extensive trials for the last three years, been found to answer most perfectly as a part substitute for oats. Where ten pounds of oats are given per day, four pounds may be taken away and their place supplied by five pounds of carrots. This has been practised in the feeding of eighty horses for the last three years, with the most complete success, and the health and condition of the horses allowed to be improved by the exchange. An acre of carrots supplies an equal quantity of food for working horses, as sixteen to twenty acres of oats."

*Curwen's Hints on Agricultural Subjects.

My own experience of the value of carrots, which has not been small, fully confirms these statements. I have obtained at the rate of more than a thousand bushels to the acre on three-quarters of an acre; but on several acres my crop has usually averaged 660 bushels to the acre.

—Smith, of Middlefield, Hampshire county, from three-fourths of an acre obtained 960 bushels.

Charles Knowlton, of Ashfield, Franklin county, this year obtained 90 bushels on twelve rods of ground. This was at the rate of 1200 bushels to the acre.

D. Moore, of Concord, Middlesex county, from six rods of land, obtained this year 56 bushels, or at the rate of 1493 bushels to the acre.

According to Josiah Quincy's experience, in Quincy, Plymouth county, charging labor at one dollar per day, his carrots cost him eleven cents per bushel. David and Stephen Little, in Newbury, Essex county, in 1813, obtained 961 bushels to the acre, at an expense of \$79 50, every expense included, excepting rent of land. This was at a rate less than nine cents to a bushel.

I shall subjoin in the Appendix an account of an experiment made in feeding swine, illustrating the value of this vegetable, from Arthur Young.

The great objection to the cultivation of carrots lies in the difficulty of keeping them, while growing, free from weeds. If sowed without any preparation, the seed is a long time in germinating, and a plentiful crop of weeds is liable to get possession of the land before the carrots make their appearance. There is another difficulty. The carrot seed, from its minuteness, is liable to be sowed too thickly. To obviate, in a degree, these objections, let the ground be ploughed deeply, well manured, and put in fine tilth; and let the first and perhaps the second crop of weeds be ploughed in. After this, let the land be thrown into ridges two feet apart, and the seed sown on top of the ridges, either in a single line, or the ridges be made so wide as to receive two rows of carrots, eight inches or one foot apart. In the mean time, the seed should be freely mixed with fine sand; and this sand kept so moist that the seed shall germinate. As soon as it is sprouted it should be sown. This may be so arranged that the sowing shall take place about the first of June. They will then have the start of the weeds. The mixture with sand will prevent their being sown too thickly. After the first thinning and weeding is over, if done with care, the battle may be considered as won. Afterwards let them be cultivated with a plough or a cultivator, and kept clean. When the time of digging arrives, the work will be greatly facilitated by passing a plough directly along the side of the carrots; and they are easily thrown out by the hand.

MILLET.—It is stated in a work on agriculture, that a gentleman in Pennsylvania sowed a peck to the acre the last of May—sowed four acres—cut middle of August, and suffered to dry in the sun for two or three days—produce 75 bushels of seed and one and a half tons of fodder to the acre. Cattle relish it. The produce per acre is frequently much greater than stated above. It is often cut in the milk. It is first sown in drills about three feet apart, and the plants should stand six inches from each other in the rows after hoing. In this latitude (New Jersey) it may be sown from the middle of May to the 20th of June.—*Corr. Farmer's Cabinet.*

[For the New England Farmer.]

FARMERS' CABINETS.

New York July, 17, 1839.

REV. MR. COLMAN.—My Dear Sir, While on a visit for a night, to a Pennsylvania German farmer we had some conversation on the facilities possessed by farmers, for aiding in the general diffusion of knowledge. Among these facilities was specified their knowledge of forest and fruit trees, and their convenience for preparing specimens for the use of public cabinets. Within a week or ten days after that, I received a letter from him, containing the names of fifty different kinds of trees growing in his vicinity, stating that himself and son, since I left them, had procured specimens of forty kinds, and expected soon to have the remainder, and probably several others. They also proposed, during the fall to collect specimens of the fruit or seed produced by the several trees; also to furnish, by impressions of the leaves, made by oiled, smoked, paper, and by the leaves themselves, formed into FOLIOS, to preserve the character of the foliage of the various trees of their forests and orchards.

His mode of preparing the specimens of wood was to take from a limb or a small tree, from four to six inches in diameter, a section of four or five inches in length, and split it into quarters or sixths, with a portion of bark upon each, one side smoothed with a plane, and the other left in the form it took in splitting, and one end cut perpendicularly, the other obliquely, to the grain of the wood. The particular object of the specimens was for presenting to the cabinet of the County Lyceum, also another set to send to Philadelphia.

My object in mentioning this fact, is to present one, among many hundred modes, which have been taken to promote and diffuse useful knowledge, a knowledge of things, among all classes and ages of the community; by which ignorant farmers, even "Dumb Dutchmen," can enlighten the minds of many, who already profess to have great light, and possibly to look upon their neighbors, less favored than themselves, as enveloped in thick clouds of ignorance.

In nearly every section of Pennsylvania "CABINETS OF NATURE AND ART" are exceedingly common in families, schools, and Lyceums. These cabinets consist of minerals, plants, embracing specimens of wood, seed or fruit and leaves: shells, insects, drawings, penmanship, needlework, mechanism, &c. They are most always collected and prepared by the younger members of families, both in their homes and their schools. House plants, and garden beds for flowers, are cultivated, and

child can hardly be found over eight or ten years of age, especially in many parts of the county, who is not entirely familiar with all the common and most of the useful minerals, and with a large portion of the plants growing in their vicinities.

In West Chester a small town, are five large buildings devoted to the purposes of education and science, which cost not less than 20,000 dollars, besides commodious houses for district schools. In one of these buildings, the County Lyceum, forty feet by fifty, three stories high, with rooms for some use, in the basement and attic, is an extensive cabinet, which, besides specimens of all, or nearly all, the minerals, plants, birds, insects and other animals found in the county, contains numerous foreign specimens in different departments of nature. Their herbarium is probably among the most extensive in the United States, containing numerous European plants received by way of exchange from various parts of Europe, and probably from other quarters of the globe.

One school in this place, collected, pressed and put up, two or three years since, in sheets or books, forty four collections of plants, each containing one hundred specimens for the Lyceum Cabinets in each of the forty four towns in the county. Another school collected, labelled and put up, 250 small mineral cabinets, for all the schools in the county. Specimens of drawing and needlework, were also prepared in the schools in this, as they were in many other towns for the use of conventions held in different parts of the state. These various specimens of juvenile improvement, prepared in numerous schools in the state were also sent to almost every quarter of the globe, especially to the various missionary stations in different parts of the earth. A volume of 500 or 600 pages, describing all the plants in this county, has been prepared by Dr Darlington of West Chester. More and better instruction in drawing, embracing architecture, machinery, plants, birds, insects and other departments of nature, is probably given in Philadelphia, than in any other town in the U. States. It is also taught with great skill in many, if not most schools, in all sections of the state. This exercise is becoming exceedingly common, and ought to be universal, or practised by every pupil in every school, as one of the first and most elementary branches. There is not a man or woman in the whole world, who has not frequent occasion to use it. If permitted, children will teach themselves this art, and much better than they are taught by most professed drawing masters, whom I have seen, who merely teach their pupils to imitate pictures. If permitted to teach themselves, children will nev-

ertheless, though these will all come in their course: rather they will produce teachers, books, scientific halls and a full supply of the very best instruments of knowledge.

Such being the character, and such the tendency and results of this natural, instructive, and delightful mode of furnishing employment for children, why not commence it at once? Why not propose some day when the friends of schools, especially the young naturalists in all our schools, shall be invited to meet in every town or neighborhood in the country, for presenting to each other, the fruits of their efforts and intelligence previously encouraged and aided by parents or teachers.

I will take this opportunity to say, that I had no intention in a hasty letter sent you a few weeks since, to speak disparagingly of systematic, scientific lectures. As aids, not substitutes, for personal effort, I have deemed them the very best. To depreciate the lectures of Professor Sillman, would be both unjust and ungrateful; as he has done more, if I am not mistaken, than any other man in the U. States to diffuse useful knowledge, and as I have partaken largely of his politeness, as well as of his instructions. I am sincerely,

and always Yours,

J. HOLBROOK.

THE HARVEST PROSPECT. In this eating world, the harvest question is one of much importance,—far above that of the Presidential question, or a thousand other questions which often interest the public. It is stated in a New York paper, that wherever the harvest has taken place, it has proved abundant, far beyond that of late years. In Western New York it is said to exceed all precedent. In the Scioto valley (Ohio) more wheat has been gathered than for any year for twenty back. In Pennsylvania and Maryland the promise is abundant;—and in short, every where, North and South, East and West, harvest time has proved, a blessing and a source of joy.—*Salem Obs.*

HOUSE PLANTS. A method has been recently discovered, by which even the most delicate plants may be cultivated in parlors and elsewhere, with great ease and perfect success, avoiding all the evils resulting from the dust and smoke, and from negligence in watering, which are the ordinary course of decay and final destruction of plants kept in dwellings. The remedy is, to enclose them in glass cases, which may be either inverted vases, or boxes containing earth in the bottom, and glazed at the top and sides. The rapid evaporation is thus prevented, and the plants preserved from in-

POTATOES.

The potato is unquestionably the most valuable root cultivated by man. It is grown with little care, yields good crops, can be grown in almost every variety of soil, and its nutritive properties are not exceeded by any other root either for man or beast. Though it can be cultivated with little care, and though almost any soil will produce potatoes, there are few crops that in both quantity and quality better repay any extra attention they may receive than this root.

The potato, like most other cultivated plants, delights in a strong rich loam, and other circumstances being equal, such a soil will usually produce one-fourth more than one very tenacious and heavy, or very light and sandy. In new settled districts large crops of potatoes are grown in the soils that contain great supplies of vegetable mould, but experience would seem to justify the opinion that in such soils the quality of the potato is rarely first rate. A grass ley—clover is the best—has been found, when properly prepared and manured, to be excellent for this crop; and if the soil is rather moist than otherwise, it is considered as increasing the chances of a good yield. Countries that have naturally a cool moist atmosphere, are found to produce far better potatoes than those that have a dry and high temperature. Thus Ireland, surrounded as it is by the ocean, and necessarily of a low and equable climate, is famous for its potatoes; and of this continent, the part most famed for the quality of this root is New Brunswick and Nova Scotia, which districts are noted for the moisture of the climate. With any part of the northern or middle States, however, the fault of not having good potatoes, or not having them in sufficient quantity, must be traced to the negligence of the farmer rather than to any deficiencies of soil or climate.

The preparation of a field for the potato is simple. If a grass ley be sufficiently rich without manuring, (a rare case with this crop,) the sod may be carefully turned over, rolled down, and then the surface earth loosened with a fine harrow, in which the tubers or sets are to be planted. If it requires manuring, let the manure, and this should be long rather than short, be evenly spread over the ground; with the plough make a furrow, and into this let one hand haul the manure to the requisite width, while another drops the seed potatoes on the manure so placed in the furrow. This row is covered by the plough, and the operation is repeated till all are planted. Corn on the ley is generally preferred, and roots well manured after the corn.—The first in the rotation may depend on convenience, as the turf is excellent for either.

A multitude of experiments have been made and recorded both in England and the United States, to determine the best method of planting the seed, whether in whole tubers or in roots cut into two or more pieces, called sets. The results of these experiments have been somewhat contradictory, yet they seem to have established the fact that whole tubers will produce rather more potatoes than sets, but not more than sufficient to balance the extra quantity of seed required where whole potatoes are used. There are many farmers who prefer sets altogether, and the probability is, that twenty bushels of large potatoes cut into sets and planted with a proper number in a hill, would produce more potatoes than the same quantity planted whole, but the space of ground planted would of course be

more extensive with the first than the last. Mr Rhodes, of Skanateles, an observing and very intelligent farmer, says he would not use whole potatoes could he have them given him, for seed; and his success with sets would seem to justify the preference.

It was once the fashion among farmers to make little mountains of their potato hills; but that seems to have been useless labor, and extra hilling is dispensed with. The ground after planting should be kept free from weeds, the earth stirred with the cultivator or the hoe, but after the tubers have begun to form the plough should not be used, as it frequently cuts so deep as to disturb the young plants, breaking off the little tubers, or causing the formation of new roots processes decidedly injurious to the crop. The general length of the vines must determine the distance at which the rows are to be planted, and this of course varies greatly in the several kinds commonly cultivated. If potatoes are planted in the rows nearer one way than the other, the rows should run north and south, that the sun may produce its proper effect on the leaves of the plant, and on the surface of the earth between the rows; and the same remark will hold good of corn or other plants, the rows of which should always run north and south, when the make of the land will permit.

When it is found that potatoes yield large quantities of balls, it is considered by many farmers, a proof that the potato has reached its maturity and begun to degenerate; the production of seeds in all plants being indicative of this fact. Mr Knight, the celebrated writer and gardener, maintained the certainty of the arrival at maturity, and consequent degeneration of all varieties of plants, the potato among the rest, and the necessity of occasionally renewing them from the seeds, which is the process nature herself employs for preventing the degeneracy or extinction of plants.

There are few districts in our country where favorite varieties of the potato are not cultivated, and not unfrequently the same kind is known in different places by different names. The Pinkeye, the Sardinia, the Mecca, or Chenango, the English and Irish whites, and the several varieties of the red and black potato, are the best known. The Rohan potato, lately introduced into this country from France, promises to be a great acquisition both for productiveness and quality. But we have yet seen no potato that for the table, could be compared for excellence with the Pinkeye. It cannot be considered a great bearer, though it yields well; but for flavor, and amount of nutrition, we think it unrivalled.

The production of early potatoes for the markets of our cities and villages, is becoming yearly a matter of more interest to the farmer; by practising the mode adopted in England of selecting the earliest kinds, and then treating them in the following manner, described by Loudon, important improvements might doubtless be effected. The cultivators in Lancashire have found that there is a fortnight's difference between the ripening of potatoes grown from opposite ends of the same potato; that part to which the root is attached being the latest in ripening, while those that spring from the nose end, are found much in advance of the others in vigor, early maturity and in size. Each potato is therefore by the gardeners divided into three parts, which are planted by themselves, and thus they ripen and are fit for the market together.

The potato being in its native state a poisonous

plant, like many others of the tropical climates from which wholesome nutriment may be derived, it should not be cooked until ripe, or becomes mealy. The value of a potato depends in a great measure on the starch it contains, and of course the nutritive matter greatly varies in the several varieties, and in the same varieties at different times. Perhaps there is no method that develops the quality of a potato more fully than baking. We have seen a very fine early variety, and also some superior specimens of the Pinkeye, when exposed to the heat of the oven, expand and burst like parched corn, into a thousand fragments. Such roots contain little else than pure starch; and the experiments of Raspail on the nutritive action of the potato, show that in such plants it is found in the most abundant quantity. Next to baking, steaming is the preferable method of preparing this root, and experience shows that it should never be given to any animal unless in a cooked state, if we would derive from it its full value.

Cellars in which the temperature is but a few degrees above the freezing point, or from 40° to 45°, are the best for roots, and particularly for the potato; but they keep no where so well as in pits, covered with just enough earth to keep out the frost. Light and exposure to the air, are injurious to roots, and in pits these are excluded. To have these roots then in their excellence in the spring, enough should be pitted for use as well as for planting. Some writers in the Quarterly Journal of Agriculture, have strenuously recommended that potatoes intended for seed, should be gathered before they are fully ripened, as being less subject to failure or to disease. But we have never known in this country any thing to justify such a course, and besides it is, we think, contrary to the course pointed out by nature herself. The average crop of potatoes per acre in the States is not large, owing to the imperfect and careless method of culture. In Susquehanna county, Pa., in 1838, the average of 2400 acres was 170 bushels per acre, which we presume exceeded the average of many other sections of our country. Now in ordinary seasons and with decent culture, the average should not be less than 300 bushels per acre; and when we remember that many instances have occurred of from 500 to 1000 bushels per acre, such an average could not be deemed extravagant. More manure and less land, would doubtless increase our potato crops, as well as most others.—*Genesee Far.*

Table Beer.—The Southern Cultivator gives the following recipe for making table beer:

“To make a cheap and wholesome table beer, take eight bottles of water, one quart of molasses, one pint of yeast, one table spoonful of cream of tartar. These ingredients being well stirred and mixed in an open vessel, after standing twentyfour hours, the beer may be bottled immediately.”

Disease of Cattle—its remedy.—Numbers of cattle during the last winter, died from over feeding, or other obstruction of the intestines: the symptoms were a protruded size from swelling, sometimes very suddenly. A sure remedy has been found by the farmers in Bradford, Hillsborough, and some other towns in this State, by mixing a quantity of apple cider with old cheese made from the milk of the cow—say half a pound or more of cheese grated in a pint of cider. This mixture poured down the throat of the swelled animal, has been known to effect a cure by carrying off the swelling in a few minutes.—*Farmer's Monthly Visitor.*

From the Cleveland Herald.

EDUCATION OF FARMERS.—No. VI.

MEANS AND MEASURES.

MR HARRIS—I have already more than once adverted to some of the means to be used and measures to be adopted, to promote the education and to protect the rights of farmers. I will close these short essays by throwing out a few hints, and making a few suggestions of a more definite character in the same subject.

I would first suggest the propriety of farmers making their own education and their own legislation within their own reach are too ample to be under the necessity of resorting to colleges or high schools for procuring either an education or instructors for their children. If their means of education were not ample, if they were entirely insufficient, colleges and high schools could not help them. They have spoiled ten farmers where they have made one.

Nor can they depend upon books, though every farmer ought to be, as he certainly may be, a man of reading, and of extensive reading. But all his reading should be put to the test of his own experience and observation. He ought to adopt no man's opinion, either in religion, politics or business, without putting it to the test of his own judgment, and judgment founded on experience and observation. With his own judgment at the helm, he can hardly read too much; without that, he can hardly read too little. For maturing a judgment undid on large experience, no school and no opportunities can be better than those afforded by his farm, his business operations, and his intercourse with society.

For aiding his experiments and directing his operations, every farmer ought to be familiar with all the fundamental principles of natural science. This the more important, as those principles are comparatively few and exceedingly simple; so much as to be, to a great extent, within the comprehension, and the highest delight of children, long before they can comprehend anything from books. These simple, elementary principles of science, which all children are so eager to acquire, are of the utmost importance for aiding them to understand and to relish the contents of books, even the very first books put into their hands.

Under these views, one important step to be taken by farmers for the education of their children, and the improvement of themselves, is to procure to aid and encourage their children in procuring naturally cabinets, or collections of minerals, plants, shells, insects, &c.

paring specimens of scientific exchanges, by which their own collections will be greatly increased, and greatly increased interest given to their meetings. Such meetings and such exercises are particularly interesting to the females and the younger members of families.

For the special benefit of the business of farmers, they have often formed social lyceums, confined to themselves, which are particularly appropriate for the winter. Connected with these meetings, a regular system of experiments has been instituted, by which each can have the benefit of the experiments of the whole, and of experiments carefully tried under the direction of science.

These social meetings and the regular series of experiments instituted by farmers, furnish some of the most valuable materials for farmers' journals, and the strongest inducements as well as means for sustaining them, both by materials and money. A farmer could hardly take and peruse a 'Monthly Farmer' or any periodical conducted by and for farmers, without being more than remunerated for his expense in a single fact or hint, which he might find in the work. The least possible reading which any farmer ought to reduce himself to, is consulting his bible daily and his 'Monthly Farmer,' 'Cultivator,' 'Visitor' or some other periodicals, as often as once a week.

Both interest and duty would lead every farmer to pursue a much more general course of reading. Works on Natural Science, Political Economy, History, Biography, and other works, to aid him in understanding and sustaining his rights and duties as a republican and christian, may be read and studied by every farmer, who wishes to realize their benefits.

More favorable opportunities could hardly be provided for improvement by reading and social intercourse than are furnished in farmers' winter evenings. By reading, examining specimens, performing experiments, and by meetings for improving each other, every farmer besides becoming highly intelligent and successful in his own business, may be sufficiently enlightened in the relations he sustains in society, and in the relations existing between the various classes and departments of society, to enable him to fulfil not only the duties of a private citizen, but of such public offices as his fellow citizens may call him to perform.

Reading, social intercourse, cabinets of nature, chemical and philosophical experiments, scientific exchanges, and especially common schools, must be greatly aided by well qualified lecturers on the different subjects of school education, physical sciences, political economy, and numerous subjects of useful knowledge.

touching it. With the hints already given, as few and as brief as they are, I must dismiss the subject, with the kind regards and high esteem of

Your friend,

J. HOLBROOK.

HEN COOPS.—Hens are useful—valuable, and as profitable as any stock on the farm; but like other stock, they should have an enclosure by themselves at certain seasons of the year, especially in the spring when the sowing and planting begins. A very cheap and convenient yard may be made for them by taking common boards, a suitable number of posts—nail the boards so nigh together that the hens cannot get through between them. This frame need not be more than four or five feet high. Then at the top nail on shingles cut so as to make sharp points, and nail them up say two inches apart. Laths cut and nailed on are better—or narrow sticks split and made sharp, and nailed on, will answer the purpose. A door of convenient size may be made to go in at. The hens may then be put in and there will be little danger of their attempting to scale the walls. The sharp points sticking up all round, look too formidable. The philosophy of the thing is this. The hen is not very good for flight, and when she attempts to fly over anything, she almost invariably lights upon it, and then jumps off. As they cannot light and rest upon these sharp points, they cannot get over very conveniently, and should any succeed in flying over at a single leap, their wings may be clipped. When put into one of these coops, food should be kept by them constantly, and also water—a little ashes for them to shake up among their feathers in a sunny day, some gravel to grind their food with, and some lime to manufacture into egg shells. When thus supplied, they will lay as well and do as well here as when out ranging about. We keep our hens and turkeys in such a yard, and find that they do extremely well.—*Maine Farmer.*

GIANTIC CLOVER.—A late number of the *London Globe*, contains the following account of a new species of clover, the seed of which has just been brought into that country from Asia:

"A gentleman has just arrived from Georgia who has brought with him a new colossal and prolific clover seed from Bukhara, which he is going to submit to Mr London. According to the accounts of the most celebrated travellers who have visited that distant and important country, which is equal in climate to Great Britain, all grains, herbs and vegetables distinguish themselves by their gigantic growth. The clover seed just imported, grows to the enormous height of twelve or fifteen feet, and

WHEAT CROP.

The abortive attempts made last year in Massachusetts, produced so much disappointment, that comparatively little wheat was sown this season. What was sown, however, in general looks well; and, unforeseen and uncontrollable accidents excepted, will yield a fair return. We have seen several fields of one, two and four acres, which we have no doubt will yield twenty, twenty-five and thirty bushels to the acre. The failure of the last season was no doubt owing to the severity of the drought in most cases. We are more than ever convinced that in most parts of Massachusetts, she may easily supply her own wheaten bread. The great object to be aimed at in order to success, is to bring to the surface a fresh soil. We are satisfied that in many cases, the application of lime to the soil would be highly favorable; in no case applied in any reasonable measure can it do harm; and in all it will be ultimately and permanently beneficial; but as yet we see no reason to alter our early conviction, a conviction not taken up at random and capriciously, but growing out of many facts and careful and reiterated experiments, that it is not indispensable. From the best information we can gather, we consider wheat under proper cultivation is ordinarily as successful as rye; and therefore from its superior value, it may be strongly recommended as a crop with which to stock down our land, when we propose to lay it in grass.

One great deficiency in our cultivation is, that it is too slovenly for wheat. We do not in some cases, take pains to have our lands thoroughly drained, so that no water may stand upon them, and the ground not be left saturated with water during winter, where winter wheat is sowed, or after rains late in the season. Nothing is more prejudicial to wheat than this neglect. In the next place, our grounds are surcharged with weeds. Wheat is for example, often sown after potatoes. What can be more rare than a clean potato crop? In general potatoes are manured with the coarsest manure; and much of it the sweepings of the barn floor full of chaff; and then they are seldom hoed more than twice, more frequently perhaps, but once in a season, so that the weeds ripen their seeds and fill the ground with a pernicious growth for the next season, among which we could scarcely expect that wheat should flourish. It is not uncommon to see an attempt at raising wheat where the weeds entirely overtop the grain. Success under such circumstances, is certainly not to be looked for. "Can a man gather grapes of thorns or figs of thistles?" In the account given of the agriculture of Norfolk, Eng. it is said that Lord Erskine, in riding over the farm of the distinguished Mr Coke, and surveying his extensive fields of wheat, discovered a single plant of lavender among the growing grain. This was deemed quite remarkable; and a premium was offered for any one who would discover any weeds in the growing crop. Mr Coke we believe not unfrequently gets six and seven quarters (eight bushels to a quarter) of wheat to the acre. Our farmers have no patience for any such cultivation as this, and with ground half prepared, full of weeds, without water furrows to drain off the wet, and perhaps with seed poorly selected and but half cleaned, we complain that we cannot raise wheat. It is matter of more just surprise that with our modes of cultivation, if modes they can be called, we can raise anything. We know of no experiments having been made with the

exception of one on a very small scale, of cultivating wheat in drills and hoeing between the drills. This is sometimes done abroad, and Beaton's Cultivator, of which one was imported by the Massachusetts Agricultural Society, is used for cleaning between the drills, which are about eight inches apart. It is, we believe, generally conceded, that the increase of the crop in this case will scarcely pay for the extra labor and pains. It is hardly to be expected with our off-hand and slight of hand way of doing things, that such cultivation should be ever dreamt of among us. Presently, however, we indulge the hope, that by some enterprising and careful farmer, the experiment at least upon a small scale, will be made among us. We confidently hope in the language of the times, that the good old Bay State will go ahead in the wheat cultivation; and we say in the language of the brave Lawrence, on an occasion of infinitely less importance, "Don't give up the ship." H. C.

SUCKERING INDIAN CORN.

The question is repeatedly proposed, is it best to sucker our corn? We believe as a general rule that no growing plant can be mutilated or stripped of its crown, its buds, or its leaves, without injury; or at least that it cannot be safely done before the seed is completely formed. There are exceptions to this at least of a qualified nature, as where a melon vine is stopped or a grape vine girdled with a view of forwarding the ripening of the fruit. The suckers of corn are of course not so important to the plant as the stalks; and the fodder obtained by removing them will be some equivalent for the labor expended in the operation. But upon the whole we hesitate in advising to it. We once suckered a large field. The growth was most extraordinarily luxuriant and heavy; and a great deal of the corn was broken down by the process. We did not accurately measure the crop, which some accidental circumstances prevented our doing; but as well as we could judge, the amount of produce was not increased, and the whole field was materially injured. We know a careful farmer in Middlesex county, who operating on a small scale and with his own hands, in a case too where the field is so small that he finds no difficulty in carrying out his suckers, who believes that he has derived some small advantage from it. The Rev. Dr Lyman, of Hatfield, gave to the Massachusetts Society an account of an experiment performed by him, of suckering a considerable field some years since. We have not seen the account for a long time; but as well as we can remember, he regarded the increase of the produce or the saving of the fodder from the suckers as not a compensation for the trouble and the injury to the corn. The fodder from the suckers is not lost if left standing until the whole is gathered. The judgment of Lorraine, whose authority in all matters pertaining to agriculture will not be questioned, is against suckering corn, or cutting the stalks until the crop is fully ripened.

In the southern States the leaves of Indian corn are stripped off for the winter fodder of their horses, and as their only practicable substitute for hay. We wish some intelligent southern cultivator, as our respected friend Ruffin, of the Farmer's Register, if this should meet his eye, or the intelligent editor of the Southern Agriculturist, would give us their views on this subject and inform us of any satisfactory experiments which may have been made to test the advantages or the injury of the practice. If opportunity presents, we shall advert to the matter of topping stalks and gathering the crop hereafter; old matters indeed, and on which we have nothing novel to recommend, but in respect to which it may be useful to call to recollection some decisive and instructive experiments which have been made. H. C.

STEAM NAVIGATION TO ENGLAND AND FOREIGN NEWS.

The Great Western has completed another of her periodical flights over the broad Atlantic in fourteen days' passage. It is said that one gentleman who went out has returned in her; and after transacting considerable business in London, has reached his family after an absence of only six weeks. What is the next miracle to be performed in the way of travelling?

The steamer brings intelligence of a declaration of war on the part of the Turkish Sultan against his Mahometan brother in Egypt, and of the kindling of the fires of strife and resentment between Russia and France—at least of an attempt to rake upon the embers and fan the sparks. When will these things have an end?—When will men cease to be savages and tigers, and learn something of Christianity, at least the first letters of its alphabet! Alas! poor human nature! Humanity everywhere trampled upon; and man in spite of all that civilization has done, is still to be classed among the most ferocious of the beasts of prey.

Great riots have taken place among the operatives at Birmingham, and numbers have been shot down by the dragons after some of the police had been killed.—These matters are spoken of as coolly and philosophically as would be the hunting of wild game and bagging our partridges and woodcocks at night. In our humble opinion, the state of society in England is most threatening to the public peace; and she is sitting upon the crust of a volcano. Mobs and riots we hold in utter abhorrence; but there is too much reason in many cases of outbreak among the lower classes of the people, to think that they are in the main right; and that these are but the effluences of honest though it may be misguided minds, stung to the quick and broken down with despair under a sense of oppression, cruelty, injustice, and outraged humanity. The day of retribution must come in the end. H. C.

BREAD STEEPS.—The Pittsburg Gazette of the 22d inst. states that flour was selling there on that day at \$3.50 per bbl. In some parts of Ohio, it is added, wheat had fallen within three or four weeks past, from \$1.50 to 75 cents per bushel. At Louisville, wheat was selling at 75 cts. but it was expected to fall to 62 1-2 cts.—Times

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, July 20, 1839.

Among the fruits exhibited this day were Peaches of surpassing beauty and exquisite fragrance; Grapes, of fine color, heavy clusters, and the berries of large size. The following gentlemen were the contributors:

- By J. F. Allen, Salem; Royal George Clingsstone and Admirable Peaches
- By Robert Milne, Portland, Me; Royal George Free-stone Peaches.
- By Dr Eustis, Brookline; Black Hamburg and White Chasselas Grapes.
- By Otis Johnson, Lynn; Black Hamburg Grapes.
- By Jacob Todd, Roxbury; Black Hamburg and White Chasselas Grapes.
- By Samuel Walker, Roxbury; several varieties of dessert Gooseberries.
- By James L. F. Warren, Brighton; a number of sorts of Gooseberries, names unknown.
- By J. Hovey, Roxbury; Gooseberries and large Dutch white Currants.
- By Thos. Mason, Charlestown; Seedling, Barnet, and White Antwerp Raspberries—all very fine.

For the Committee,

E. M. RICHARDS.

EXHIBITION OF FRUITS.

Saturday, July 29.

The display of Fruits was very choice, and it gave us pleasure to notice the very decided improvement in the size and color (since the last week) of J. F. Allen's peaches, grown in Salem. They were truly very splendid. The same gentleman also exhibited fine specimens of Black Hamburgh Grapes, and three varieties of White Chasselas.

By J. S. Ellery, Woodland Brookline—Black Hamburgh, White Chasselas and Miller's Burgundy grapes; a later uncommonly large for that variety.

By Matthew Skilton, Charlestown; large Apricots—time not mentioned.

By B. V. French, Braintree; Heath's Early Non-such apples—a small but desirable fruit for its early maturity.

By William Kenrick, Nonantum Hill, Newton; various sorts of Gooseberries, also large White Dutch currants.

For the Committee on Fruits,
E. M. RICHARDS.

BRIGHTON MARKET—MONDAY, July 29, 1859.

Reported for the New England Farmer.

At Market, 170 Beef Cattle, (including those unsold last week,) 12 Cows and Calves, 110 Stores, and 2600 sheep.

PRICES—Beef Cattle—Sales quick and prices of last week were fully sustained. We quote First quality, \$7 00 a \$8 25. Second quality, \$7 50 a \$7 75. Third quality, \$6 50 a \$7 25.

Stores.—About half at market were sold in one lot. We did not learn the price. A few only were peddled. Cows and Calves.—Sales were noticed at \$26, \$33, \$5, \$34 and \$30.

Sheep.—Dull. Some lots of old sheep were sold for 25 cents a head, less than they cost in the country. We tried a fine lot of Wethers from Hoxick, N. Y., sold at less than the original cost. We quote lots from \$1 25 to \$3 50.

Swine.—None at market except a very few old hogs sold last week, and there appears to be no demand. A few old hogs were very fine and were taken for 7 1-4, mostly barrows.

THERMOMETRICAL.

Reported for the New England Farmer.

shows every day except two, notwithstanding which it has been a very good time for making hay.

DORKING FOWLS.

For sale, a few pair pure Dorking Fowls. A few breeds, comprehending, have a title to boast of so high and long conceded a reputation as the Dorking.

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street. July 10.

AUSTIN'S SCYTHIE RIFLES.

For sale at New England Agricultural Warehouse and Seed Store. These Rifles are considered the best. They are casesd with fine Emery, wear well and give a good sharp edge to the scythe. They have come into very general use and are a good substitute for the scythe stone. A fresh lot just received. JOSEPH BRECK & CO., 51 and 52 North Market Street.

MISCELLANEOUS.

RAILROAD ENGINE.

The following grand description of this new and mighty animal, that is now careering through our land, is extracted from the London Quarterly Review:

"There are, no doubt, many of our readers who have yet to receive those common-place impressions which are made upon the mind of the traveller, when for the first time he sees and hears the engine, as from a point in advance on the railway it retrogradingly approaches in order to be hooked on to a train composed, as on the London and Liverpool line, of eighteen or twenty huge cars, besides private carriages on runners, caravans full of horses, wagons of heavy goods, &c. &c. &c. The immense weight, upwards of eighty tons, to be transported at such a pace to such a distance, when compared with the slight, neat outline of the engine, the circumference of whose black funnel would not twice go round the neck of an antelope, and whose bright copper boiler would not twice equal the girth or barrel of a race-horse, induces the stranger to apprehend for a moment that the approaching power must prove totally inadequate; but the tearing and deafening noise with which this noble animal of man's creation advances to his work, satisfactorily demonstrates that it has itself no fear, but comes as a bridegroom out of his chamber, rejoicing like a giant to run his course.

If the character of this noble creature be considered for a moment with that of a horse, the comparison is curious. With sufficient coals and water in his manger, which, it must be observed, whenever he travels he takes with him, he can, if the aggregate of his day's work be considered, carry every day for years, at the rate of sixteen miles an hour, the weight of an army of 21,404 men, of 10 stone 10 lbs. each; whereas a good horse could not, at the same pace, and for the same distance, continue to carry, every day, more than one such man. For a distance of 80 miles he can carry the weight of 2,788 men at a rate (16 miles an hour) that neither the hare, the antelope, nor the race-horse could keep up with him.

No journey ever tires him; he is never heard to grumble but for want of work; the faster he goes the more ravenously he feeds; and for two years he can thus travel without medicine or surgery. It requires however, £2000 a year to support him. We might to these observations add a graver reflection; that, as by the invention of the telescope, man has extended his vision beyond that of the eagle, so, by the invention of the locomotive engine, he has now surpassed in speed every quadruped on the globe. We will, however, detain the engine no longer, but for a few moments will, with our readers, accompany the train with which it has now started.

The dashing at full steam speed into the small orifices of the tunnel—the midnight darkness that prevails there—the flashes of light that occasionally denote air shafts—the sudden return to the joyous sunshine of the world—the figures of the company's green servants, who, as the train whisks past them, stand all in the same attitude, motionless as statues, with white flags (the emblems of safety) in their extended hands—the occasional shrill, plaintive whistle or scream by which the engine, whenever necessary, scares the workmen from the rails—the meteor-like meeting of a return car, of which *in transitu* no more is seen than of the col-

ored figures on one of the long strips of painted glass, which, after slow exhibition before children, are by the showman rapidly drawn across the lens of his magic lantern; all these sensations unite in making the traveller practically sensible of the astonishing velocity with which not only he and his fellow passengers, each seated in his arm chair, but heavy goods, can now be transported."

The following communication comes from an esteemed correspondent, who has left us some of the oak galls referred to for distribution to those who may wish to test their virtues in the disease in question.—*Bull. Amer.*

REMEDY FOR DYSENTERY.—Grate a dry oak gall (or ball) fine and stew it for a few minutes in about the third of a tea-cup full of water; then add a tea-cup full of brandy and sufficient loaf sugar to make it very sweet. For a grown person take a table spoonful and repeat every hour or two according to the virulence of the disease. For a child a tea-spoonful is sufficient. Two or three doses will generally effect a cure.

I have known this remedy to succeed in the most violent case of dysentery.

I do not know whether the oak gall can be had of the apothecaries, but they are abundant in the country, and can be obtained gratuitously at almost every farm in the vicinity of Baltimore.

A few of them are left with the editors of the American to be given to such as desire to try them.

YANKEE PERSEVERANCE.—An itinerant map seller went into a merchant's counting room near our office, the other day, and asked the occupant if he wished to purchase a map. "No," was the tart reply. "Will you look at one?" "No; I have more of my own now than I have time to examine." "Will you allow me to look at yours then?" "Yes, there they hang." "Well, while I am looking at yours I'll just unroll mine—that you know won't hurt any body." So the map vendor displayed several of his best at full length upon the counter, and then quietly commenced looking at the merchant's, which hung against the wall. After making a few observations about some curious water falls, caves, &c. at places which he traced out upon the map before him, he managed to engage the merchant's attention, and at last referred to his own map, lying on the counter, for a more perfect illustration of his descriptions, and finally so much interested the auditor, that he bought three different maps, at six dollars each, of the pedler, and very politely asked him to call again when he put out a new edition!—*Bost. Post.*

ELOQUENCE.—A Mississippi paper gives the following pathetic commencement of a speech of one of their lawyers some years since, on the trial of a negro for the murder of another named Daniel, whom he buried on the hill-side, in such haste as to leave one of his feet uncovered, which led to the detection of the crime:

"Gentlemen of the Jury—Daniel is no more! no more shall Daniel pluck the snowy cotton ball, or plough the straight furrow—no more shall he enliven the negro quarter on Saturday nights with the recital of con hunts, or sing "jaw bone" at the corn shuckling! No, gentlemen, he lies buried on the hill-side, with one foot out and one foot pointing to the arched vault of heaven!"

STRAWBERRIES.

Those who are desirous of cultivating this delicious are respectfully informed that the subscriber has sowed after a number of years experimenting upon the *Strawberry* not only in obtaining new varieties, but in ascertaining the best method of cultivation.

Specimens of the fruits grown in his Garden have exhibited at the Massachusetts Horticultural Society for the four past years, and are also too well known in *Fruit & Flower* to need a particular notice here.

He has for sale at his Garden in Brighton, Mass., following eight varieties of Plants. They are of superior stock and quality, all warranted to be truly named and from the mixtures often found in those offered for sale miscuously.

Those who are in want of Strawberry Plants, are respectfully informed that they will find it interesting to call at the Horticultural Rooms for two years past, measuring and a half inches in circumference. The method of cultivation, and any information desired will be cheerfully given.

The subscriber would state that from many years personal experience, he is satisfied that plantations of these will make the last of July or early in August, by careful attention to the soil, and planting nearly or quite as much the season following as those plantations made in the Spring will produce the second year.

Warren's Seedling Methuen.—A new and valuable fruit free bearer, fruit very large and juicy; fruit measure four and a half inches have been exhibited the present season.

Methuen Castle.—Fruit extremely large, high flavoured and showy. Specimens of this kind have been exhibited at the Horticultural Rooms for two years past, measuring and a half inches in circumference.

Bath Scarlet.—Fruit large, full bearer, and beautiful color.

Early Virginia.—This is considered the earliest fruit free bearer, hardy, and very early; decidedly a fine kind for market.

Royal Scarlet.—Fruit long oval shaped and juicy.

Hyacinth.—Fruit smaller but very numerous.

English Wood.—Fruit well known.

Monthly.—Fruit is gathered from the vines from June

October, and in good quantity and fine quality.

Orders left at the Garden, or directed to the subscriber, Brighton, Mass., or left at Messrs J. Breck & Co's

Agricultural Warehouse, Boston, will be carefully packed and forwarded agreeably to directions.

TULIPS, RAMNUNCULUS, ANEMONES, AURICULAS, CANTIONS, PICOTEES, PINES AND GERANIUMS.

II. GROOM, of Walsworth, near London, England, by appointment Florist to Her Majesty Queen Victoria, begs respectfully to call the attention of his friends and the admirers of flowers in America generally, to his extensive collection of the above flowers, which from his having been very successful in their cultivation this season he can offer at moderate prices. He would particularly recommend to those persons about commencing the growth of the Tulip (which in England is becoming very fashionable) the mode recommended in beds, as it is by far the cheapest mode of purchasing them.

Tulips arranged in beds with their names.

First Class.

A bed of 30 rows containing 210 bulbs including several

the newest varieties,

A bed of 45 rows 25 guineas

A bed of 60 rows

Second Class.

A bed of 30 rows including many fine sorts,

A bed of 45 rows do

A bed of 60 rows do £17

Tulips not arranged.

THE SEASON—MEADOW LANDS.

MR COLMAN—With us, an unpleasant mowing is a matter of so rare occurrence, that when one makes its appearance we are confident that some fog in the weather, or perhaps more properly in ourselves, is amazingly out of place, or it would not be so. We are willing to say that there is much difference in mowings, and to this difference they may perhaps owe some of their charms, and the very contrast which one gives to the other, to us makes them beautiful; as for instance, after a dry time, what can be pleasanter than to awake and hear the rain pattering against one's windows, while the stillness which may long have held the air inurance, has been broken by rough winds, that shake the forest leaves tremble on their branches, or shake the limbs of the old oaks as if they inspired with a belief that all nature was created for activity. All this is necessary as well as very pleasant. Man must have exercise or he becomes puny, diseased being, both in body and mind. The beast of the field and the fowl of the air will rest for a long time put themselves down to rest in quiet dormancy, but indulge in stillness only when fatigue requires it. They are things of active habits, and nature has endowed them with power to practice their own gymnastics, which is manifested by their skipping upon the hills, racing in the valleys, or sailing through the air. But vegetable nature possesses not within itself this power of exchanging place to impart muscular energy, consequently nature, like a nursing mother, supplies the defect, and while the rough winds become subservient to the exercise of the tall old trees of the mountain, the gentle breeze sighs playfully among the small ones of the forest, which they shelter, or sweeps gently along over the tender productions of the rain field and the meadow, giving health and strength to the subjects of its influence.

July thus far has been the *beau real* of our ideas a beautiful month. We have had the gentle shower, and the rain in torrents, sometimes so great seriously to injure the roads, as if it would try the works of men, the hail, and the

around and beneath us, is a fine picture of rural beauty, for while the mountain's side is rich in the loveliness of its emerald shield, dotted here and there with the tall stump of some old tree, whose scar and yellow leaves a long time ago may have fallen for the last time to the earth, leaving itself to stand only as the remains of another age, with the tall chestnuts hanging out their blossoms of pure white, give a variety to the woodland scenery;—while the valley, beautifully sprinkled with groves, whose sires like those of their occupants, have passed away, leaving to them the inheritance which they once so proudly claimed—are fringed with the meadow, ready for the scythe, or the grain field ripening for the sickle, or perhaps the corn field, dressed in the rich coloring of healthful vegetation, waiting the influence of our golden summer sun to mature it to a golden harvest, with a multitude more of lesser but essential and smiling beauties, which greet us not with the smile of deception or the kiss of treachery, but with all the loveliness which our varied scenery can offer.

Haying is just commencing, with a prospect of more than a middling crop—consequently the attention of the farmer is naturally drawn to his meadows, and a fair opportunity offers for him to make such improvements in them as will make them beautiful and more productive. We say beautiful—why not? We are all of us admirers of beauty, and sometimes when it presents itself in worthless objects, very properly then may it be admired when blended with utility and comfort; and a meadow in order to be comfortable must be beautiful. According to our idea of this beauty and utility, a meadow should in the first place be made very smooth, as much so as a nine-pin alley or a parade ground—places which are seldom occupied except for a few hours' amusement, or to perform the service of one or two days in a year. But we are heedless about our meadows, which should often meet the eye and chain it with their even surface, so much so that a man even in these temperance days, can scarcely walk on them without stumbling—a pretty apology for drunkenness surely, these rough meadows, and a pretty employment they furnish for the boy at the grindstone, besides due encouragement to the scythe-maker, for in the very first season of mowing, these little protuber-

ances lie in heaps from which an occasional one may have rolled into the grass, just to inform the mower of his approach to a monument of folly, while others are scattered here and there as the harrow left them last year—the memorials of indolence or sheer carelessness. In either case their presence is attended with " vexation of spirit," a " dreadful sort of feeling," which never ought to disturb the farmer's bosom, because it makes him unhappy.—A very proper time for removing stones from meadows, when it has been neglected at a more proper one, is soon after the grass is taken off, and it may be done on a lowery day in hay time with much more propriety and comfort than the said day could be spent in fishing or in many other employments. If not done then, attend to it as soon as haying is over.

Another thing, (and in many meadows it is not a small one) to be attended to is the selection of the poor parts of the meadow, or those which are in the lowest state of exhaustion. These may be truly defined now, for harvest tells no untrue tales of the condition of the earth, and they should be carefully marked out with stakes, (if they do not as in some cases, extend to the fence or hedge-row within it,) that they may meet with proper encouragement either in fall or spring, to do better next and coming years.

We have tried various ways to render these spots and blemishes more productive. One which we have found very beneficial is, to collect what manure we can in summer, [we always clear our yard in spring] and as soon as we may be after the crop is taken off, carry out and spread it, which we prefer doing just before a rain, that it may benefit the earth instead of the atmosphere. We sometimes repeat the operation of yard-cleaning in November, for it is a principle with us that manure is a capital which should be soon invested in order to make the greatest returns, and we had rather have it spread in autumn than in spring by thirty per cent. We do not, however, apply it often as a top dressing, except on lands too moist to plough advantageously, and we think that the sooner it is applied after the crop is taken off the better, provided rain soon follows, as it is then that the grass is making new efforts to shoot forth, a process which, had it any

[For the New England Farmer.]

FARMERS' GARDENS.

To most farmers the idea of a good garden is synonymous with something quite beyond their reach—perhaps we "may as well out with it" and say, something quite beneath their notice. They "like to see them," (though we have once heard a farmer or rather an apology for one, say he had rather see a hill of potatoes in a field than a garden of choice vegetables, fine fruits and gaudy flowers, which he had just been viewing: poor man—we pitted him ;) but then they require so much labor, such small work too, fit only for women and children; they have no time for it; and then after all, they do not seem to amount to much. Such are the common remarks of farmers with regard to gardens, those emblems of the residence appointed to man in the state of his purity, and the types of what the productive parts of the earth may, probably will be, when man retraces the path which his sinning parents took, when "with wandering steps and slow," they took their last journey from the home which their Creator had fitted up for their permanent enjoyment. But to the remarks. They like to see them, and we have in many instances seen their approbation manifested by a rude trampling upon and breaking down without leave or mercy, of many of the choicest products of a garden—plants which had required much labor in rearing and promised much pleasure in enjoyment. A horrid species of affection to be sure, but we had rather sometimes see this manifested in a small degree than to see an individual pass one of these beautiful repositories of nature and art, blended in sweet communion, with sheer indifference, for while man notices, even if his notice is marked by a shade of savage ferocity, there is hope that he may improve. But these remarks apply not to all. We allow there are many who do like to see them, and some who like to have them so near their dwellings as to see them at any time. "They require so much labor." Whatever renders life delightful, "all is the gift of industry." We are fully aware that a garden in order to show well—(this world is made up of shows, many of them useless indeed)—and to produce well, requires much labor, and so does any other object worth possessing. All however, who know anything of the comfort and luxury that a garden can be made to produce, will join me in the assertion, that in all the divisions of the farmer's labor, there is none which yields him a greater return than this; not in our inland towns a return estimated by dollars and cents it may be, but of substantial comforts and healthful luxuries, of objects to charm the eye and please the soul, as well as to satisfy the cravings of the mortal man. What noble achievements to be gained by one's own labor!

For man, proud, aspiring man, it may indeed be small business to labor in a garden, but it was not beneath his Maker to create one, and adorn it with all that was pleasant to the sight and good for food, nor is he now regardless of the smallest of all his works, however despicable they may appear in human eyes.

That the labors of a garden do not amount to much, is a supposition worthy only of those who have never enjoyed its benefits. But why do we see the attention (small compared with what it should be) paid to gardens, which is done in most of our villages? Simply because the quantity of land appropriated to such family is necessarily small, and that they wish to make the most of it—

or is it rather, the inhabitants of such places appreciate the luxuries that a garden affords more fully than the farmer? Something of both may be the case, and if both or either make it an object in town, it surely may be one in the country, at least so far as is necessary for family consumption, and if a want of time is an apology for the farmer, it surely might be with the merchant and mechanic, with their thousand customers at their heels. But the excuse is good no where. Every man has, or may have, if his time is properly apportioned, an ample supply for the garden, inasmuch as it is a repository into which all the odd ends and loose change of time may be profitably thrown. The great difference is, that application to business is a part of the education of the mechanic or merchant, while too many farmers are brought up to indulge in many an idle half hour, which is often sadly spent in discussing the qualities of an enviable neighbor, or indulging in a favorite sport, which savors of cruelty. Solomon says, "there is a time for every purpose," and we have no doubt but it extends to making and tending gardens, for we have the assurance that he spake of all plants from the humble hyssop to the cedar of Lebanon, also that he dug pools of water, and planted orchards and vineyards.

We are established in the opinion, and our experience fully confirms it, that a garden is absolutely necessary to the completion of a farm establishment, and that where good farming does actually exist, many of the choice productions of the earth must be lost unless removed to the garden. Take for instance the strawberry. It is usually found in old worn out fields—very seldom in those highly cultivated. Is it economy for the farmer to let his meadow or pasture depreciate in order to furnish him with fruit? Is it desirable that his family should be denied the healthful luxury it affords simply because it will not grow in his fields? We think not. The garden is its appropriate place and there it should be cultivated. We have tried it, and we find that including the amount of labor of cultivating with gathering in the garden, the cost is less than that of gathering in the fields, while in the former case we know where we are sure of a supply, and in the latter all is uncertainty, for on arriving at the field you may find that your neighbor's boys, who have no time to spend in the garden, have preceded you and robbed you of your spoil, though they actually had no business to do so. Here then you are saved the vexation of a disappointment, which is calculated to give you no very kind feelings toward your surroundings, and the excitability which the sight of your trampled meadow or fanished pasture is calculated to inspire.

Strawberries which grow in gardens under the hand of culture, are larger and frequently of more delicious flavor than those grown in fields, and besides, the appearance of a strawberry bed is very pleasant, laid out in beautiful rows and decorated with its chaste white flowers, or its fragrant fruit giving a balmy softness to air around. The same remark applies to the raspberry and bramble. They have no business in the corners of fence or along the walls and around old stumps, extracting from the richest soils their fertility, and where the same vexations attend their procurement as do that of strawberries. They should be aliens in the farmer's fields and citizens at home in his garden, where they should "enjoy all the rights and immunities" that cultivation offers. Their presence will beautify the garden—their absence ornament the mead-

ow.—But our native fruits and plants should not usurp this peaceful, quiet domain. The productions of other countries should be brought in to dispense their share of beauty to the beholder and comfort to the consumer. In short, the garden should be a sort of cabinet, where the valuable and curious productions of all climes should be arranged in order, according to their rank and in classes according to their diversity; and ye should talk of them to your children when ye walk among them when ye sit down and when ye rise up. Let a portion of the garden be appropriated to each of your sons and daughters; this will excite in them a laudable ambition to excel in a good work—will furnish them an agreeable and healthful employment—will encourage them to be useful in raising the richest fruits and choicest flowers, will encourage a love of nature, and we verily believe at the same time, a hatred of vice; for vice appears to us an unnatural thing,—will kindle in their souls more ardent attachments to each other, will inspire a love of home, the place where the habits are to be formed and the principles are to be sown and take root and spring upward, which are to actuate them in after years, and then may be disseminated to all around them. When the home whence they originated may be far away, what kind associations will be awakened by the memory of their early days thus spent with their dearest and best friends? When the eye grows dim, what a halo of light will reflect upon it, when it looks back to these early scenes of virtuous employment.

Farmers, who of you will improve your premises and your families by improving your gardens?—Some must begin, or by the mass it will never be completed. The world will never rise *en masse* for its own improvement. Whatever is done must be commenced by individual effort, and the example of individuals and their success will accomplish the object. But success does not always immediately crown our efforts. Perseverance is its harbinger, and in no pursuit is perseverance more necessary than in the culture of the earth, particularly the garden. Be not discouraged then, if in your first humble essays you meet with failures, but go cheerfully on and in due time you will reap the reward of all your labors, "if ye faint not."

Mt. Osceola, July 16, 1839.

W. B.

From the Geneva (N.Y.) Courier.

THE CROPS.—The whole of the western farming districts is groaning with abundance. Every acre of land has been this season made to yield. Many farmers have sown grain in their orchards, yards, and many by-places, heretofore quite useless. Their efforts and industry, we are happy to say, will undoubtedly be crowned with unparalleled success. We think the growing grain of all kinds is sufficiently advanced to be beyond the reach of the evils which have so often befallen crops in this section. No serious complaints are heard about the worm or fly. The berry of the wheat is filling well and rapidly, and the weather is so favorable as to preclude all fear of its rusting. We believe we are safe in asserting that the crops of 1839 will vastly exceed in quantity and quality, those of any year since the settlement of the country.

The Journal of Commerce estimates from the richness of the wheat crops already gathered and the promising appearance of those yet to come in, that the value of the bread stuffs will be \$10,000,000.

For the N. E. Farmer.

THE EDUCATION OF FARMERS.

In a late number of your paper, Mr Editor, we alluded to the *self education* of farmers, as all important to the improvement of our agriculture, and to some of the means that present themselves for this mode of self-culture. We alluded more particularly to their professional education, and not to their moral and intellectual development. To this portion of our subject we shall presently come.—We conceive that this matter of self education, this combination of scientific knowledge and skillful practice, will be one of the great engines for the regeneration of our husbandry, and that it is the absence of it that has kept a discreet culture of the soil so long in the back ground. We moreover entertain the highest respect for all self-educated men, be their calling what it may. The builders of their own minds and fortunes, they give a character and zest to any pursuit they may enter. Tied down by no dependence upon the favors of moneyed or literary institutions, or the munificence of individuals, they are enabled to give free scope to any energy or originality of thought they may possess, and can model themselves to suit the circumstances of their situation. They are more nearly than any other class of men, creatures of nature, without the artificial deformities of human invention; and know of no more ready and efficient method for improving any pursuit than the professional self-education of those engaged in it. Let them bury every prejudice that is not founded on long and well tried experience—let them avail themselves of instruction from every and any quarter, whether it be book or paper or the lips of those already engaged in the pursuit—let them adapt such instruction to their circumstances and experience—and there is no reason why any profession, and more particularly agriculture, should not meet with all the success and assume the highest rank it can possibly be entitled to.

But in urging upon our farmers the importance of more thoroughly educating themselves than they do, for their peculiar calling, we would not forget that there is another vast power for improving our husbandry, and that is by educating our farmers' sons for their profession. And here again the agricultural interest meets with a most unaccountable and unpardonable neglect at the hands of the public and of those most intimately concerned in its welfare. While institutions are endowed for the preparation of young men for almost every pursuit, while the countenance of government is lent to the support of almost every other branch of education, and while the munificence of private in-

the pursuit they are to follow? Do we ever hear of any peculiar text books offered them to prepare them for being tillers of the soil? Are the different branches of Natural Philosophy, of Mechanics, Political Economy, &c. &c., put into their hands with reference to, and to train them for, being farmers? Are their minds ever directed, in the lessons they are continually receiving from friends and teachers, from the pulpit and the rostrum, to the beauties and pleasures, the importance and dignity of agriculture? And, what is still more, is instruction ever conveyed to them on the immediate divisions of husbandry, as conducted on broad and scientific principles, except such as they can gather from watching the systems and operations, perhaps crude and erroneous, of their fathers?

In these remarks we would not be understood as complaining of our universities or high schools, or our common schools, as misguided or futile in their efforts. We are not of those who indulge in groundless murmurs at "an aristocracy of learning," (as it is cantingly termed,) or who would draw invidious comparisons between *practical common sense* and a *classical education*. It would ill become a citizen of Massachusetts to complain that not enough is doing for the universal education of the people, or that it is not being done in the most effectual manner. Our complaint is, that amid the many *educational* improvements of the day in our country, so little, I may say that nothing is done to prepare so large a body of our youth, professionally, for the culture of the soil. It is the absence of this early education for farmers that has given birth to the idea that is so prevalent, that agriculture is *merely* the turning up of the sod and the fattening of cattle. Our farmers themselves have too often considered it so, and the community, judging by those engaged in it, have naturally drawn the same conclusion. And hence the distaste that a large number of our young men manifest for the pursuit. Their minds as well as their bodies must be active, and they are naturally disinclined to bury themselves in a calling, dependent, as they have been taught to believe, upon muscular exertion alone for success.

There are then several reasons of great force in our own mind, why agriculture should be made a matter of early education. And first, the successful culture of the soil, it will not be denied, draws as largely upon the energies of the mind as the body, and that, besides being dependent upon their development, it is equally so upon many branches of science and art, which to be thoroughly attained, must be early commenced and long continued. The great principles of animal and vegetable physiology may be obtained by long and slow observa-

like the mechanic with tools and materials, without knowing the peculiar, technical principles of the object he is to construct. We can only say, we pity such a man, and trust that his good fortune will supply the deficiencies of his professional acquirements. But our limits warn us to close, and we reserve, with your permission, Mr Editor, our remaining remarks for another paper.

Greenfield, July 15, 1839.

II. V.

Silk Growing is destined to be no small business in Hampshire county. We took occasion with a friend last week to visit three or four of the most intelligent and active men in the neighboring towns engaged in the mulberry and silk business. In Williamsburg, deacon Bodman is growing some twenty or thirty thousand trees of the different kinds, Multicaulis, Canton and Alpine. Some of them promise well, and already he has engaged the crop of Canton trees now growing upon one-fifth of an acre, to be delivered this fall, at \$1000. His cocoonery is an old, but spacious building, well ventilated, and he has fed and is feeding about seventy thousand worms. Dr Bardwell, of Whately, has a plantation of some ten or fifteen thousand trees, of the three varieties, all of which look equally well, and throw off about the same amount of foliage. He is not feeding extensively yet, but some specimens of raw silk, reeled upon a simple, but neat machine of his own construction, can hardly be surpassed in beauty.

Mr Timothy Smith, of Amherst, is going into the business on a large scale. His plantations of about 50,000 Canton trees, (for he cultivates no other,) are both luxuriant and beautiful. His cocoonery is a very neat affair, the worms having just finished winding, and another crop are about hatching out. His method of winding the cocoons is both neat and beautiful. Small bunches of straw are placed between the boards, upon which the worms feed, and the top and bottom spread out so as to resemble an hour glass. Sixty cocoons are sometimes found in one bunch of straw, the floss is easily saved, and the place seems just the sort of refuge desired by the worms. His reel for winding is simple, and the raw silk just wound by his worthy spouse, would make an honest Chinese blush, at its superior lustre and beauty.

It is an entire mistake to suppose those engaged in the business in this county, intend to confine their operations to growing trees. Every practical farmer who has tried the experiment, is satisfied that it can be made one of the most lucrative branches of farming. At least, those now growing trees have so decided. We are not yet satisfied

From the Genesee Farmer.

—
DICTIONARY OF TERMS USED IN AGRICULTURE,

And in the Sciences most intimately connected with its advancement.

CABBAGE. (*Brassica oleracea*.) This well known plant is extensively cultivated in most gardens for culinary purposes; and in some places is grown largely in the field for feeding to animals. The cabbage formed a prominent article in the plan of Cobbett, by which one-fourth acre of land was to support a cow the year round. In climates that are suitable, the plant called the tree cabbage will furnish a great amount of food, and is profitably cultivated for animals. The common cabbage requires a rich soil, and will thrive the best in loam. It should be planted from four to six feet apart, according to the kind; some varieties being much larger than others. Cabbages should be planted as early as the ground can be fitted for their reception, and those designed for summer use, should be started in hot beds, where this convenience is at hand. In the preservation of cabbages for use in winter, they are generally put in cellars, but they are very apt to mould and rot; and if the temperature is not very low, the heads will crack open, and the new shoots put forth before the season for transplanting arrives, thus destroying the head. Burying in the ground where the earth is dry, the covering of earth comparatively slight, is probably one of the best methods of preserving them fresh and in good order. The cabbage will bear a considerable degree of cold without injury, if situated so that the frost is taken out gradually by the earth. Large quantities are annually made into sour kraut, an article which forms an important part of all ship stores destined for long voyages, and to the use of which, much of the exemption of sailors from their terrible disease the scurvy, is now to be attributed. There are many varieties of this plant; but the general properties are the same.

CALCIUM. This is the name of a metal discovered by Sir H. Davy, and constitutes the basis of lime. It is of a silver color, burns with great brilliancy when brought in contact with atmospheric air, and absorbs oxygen so rapidly, that it quickly assumes the form of lime. The term *calcareous* as applied to earths containing lime, is derived from this word; and in the form of carbonate of lime, or common limestone, there is perhaps no substance more universally diffused, or which acts a more important part in the economy of vegetation.

CALORIC. This is the name given to that agent which produces heat and combustion, and exercises a great influence on the principal phenomena of nature. It is imponderable, and appears to exist in two states—*free*, or uncombined, and *latent*, or combined. Perhaps there is nothing that has a more decided influence in nature than caloric. Under God, it seems to be the supporter of all vegetable and animal life; and it appears certain that a state of absolute cold would be a state of absolute death. The opinions of learned men at the present time seem tending to the belief, that caloric, electricity, galvanism, magnetism and light, are effects of one and the same agent, depending for the different appearances and effects on its accumulation, rest or motion. On agriculture this agent acts with great effect, since the soil is cold or hot according as it retains or parts with the caloric

it receives from the sun. Soils that are black or white receive the least benefit from heat; the black mould, while it acquires heat with great rapidity, giving it off still more freely; and the white soils, owing their color principally to clay that retains moisture very strongly, scarcely feel its influence, the heat being carried off in evaporating the water. The experiments of Rumford and Leslie show, that a vessel covered with lampblack radiated heat at the rate of 160°, while one made of bright tin plate gave out only 12°. Soils in which mould or black earth is properly combined with siliceous and aluminous, will retain heat the longest, as the black gives it out to the others instead of radiating it into space. A melon laid on a bed of powdered charcoal will ripen, when one on common earth will remain green and immature.

CALVES. The young of the cow—*bus* of Lin. The value of the future ox or cow is greatly depending on the treatment the calf receives; and hence much attention has been paid to the rearing of the young animal, in districts where the breeding of cattle forms an important object to the farmer. Where circumstances will permit, allowing the calf to run with the cow and draw his food directly from her, is probably the best method, since it is that of nature; but as the milk for dairy purposes is valuable, breeders have substituted many modes of feeding the calf, in which milk is partly dispensed with, some other nutritive substance taking its place. As a general rule, the calf should be allowed to suck the cow till the milk is good. Some allow them to suck a week or fortnight, according to their strength; but we have found that where calves were to be taken off, the earlier it was done the better for both cow and calf it was, both making less ado at the separation. According to Marshall, a celebrated English breeder, the best method after the calf is taken from the cow is this: "new milk in the pail a few meals; next, new milk and skim milk mixed, a few meals more; then skim milk alone, or porridge made of milk, water, oatmeal, and sometimes oil cake, till cheese making commences; after which, whey porridge, or sweet whey in the field." When fed from the pail, calves require about two gallons daily; but care must be taken not to give it them too cold, as it will cause the calf to purge. When this is the case, one or two scrupulous of rennet in the milk will be a good remedy. Great regularity should be used in feeding calves; and they should always have sweet grass or good clover hay to nibble upon in the intervals of feeding with milk. Calves should always be housed in the winter, have good hay, water and occasionally salt. They are easily taught to eat carrots or turnips, and we never knew a lot of calves that had each a good "nubbin" of corn daily from the hand of the master, and plenty of good hay, that did not go through the first winter well.

(To be continued)

Extract of a letter from Ohio, dated July 9.—"There is a general failure of mulberry cuttings in this region. We have all been *humbogged* into the plan of cutting the trees into single buds; the consequence is, not more than one-fifth of them have vegetated."

By another letter from Vermont, the same story about the failure of cuttings is told, with the opinion that in our climate the only way to ensure success, is to lay down the root and stalk; for where this has been done, there is an abundant return of

vigorous sprouts. Mulberry seed has universally failed; is it possible that this failure is a *safety veil* to screen the seller?

Extract of a letter from Georgia, of July 16:

"Our mulberry trees, such as are spared by the unexampled frosts, are now growing finely; some will be from 5 to 10 feet high. While riding out yesterday I passed a garden where I saw a mulberry of this year's growth, and which I judged to be from 10 to 11 feet in height. Respecting the price of trees, I cannot exactly say what they will be worth; however, I should think 50 cents might be a fair price. One house is offering trees of northern growth at 10 cents per foot. S.— is laying down his trees with all despatch, in hopes of making up for the great loss and failure of cuttings. The large leaf Canton flourishes wonderfully; the leaf is large and thick set upon the stalk. Out of 26,000 cuttings only 814 have survived; and it is understood that some who have suffered yet more severely, have ploughed up their land and planted it with corn; but I hope that our few cuttings saved, and what may be increased by layers, will, after all, make somewhat of an imposing yield."—*Northampton Courier.*

The Philadelphia Ledger says—"The Washington City Silk Company planted about 200,000 buds and roots upon about 12 acres of land, admirably suited to the growth of *Morus Multicaulis*, about the 25th of March; they have now about 60,000 trees growing—140,000 having failed; they selected the best buds for the planting, and have had much better success than any other planter in this vicinity, who depended upon *one bud* cuttings. A near neighbor of ours planted 20,000 buds raised by himself and planted by his own hands during every favorable season in April, and he cannot count more than 200 of them growing; from what I have seen and heard, the number of trees growing in this district this season, will be equal to about one-tenth of the number next year. I suppose 1,000,000 of worms are now feeding in these ten miles square."

From the Genesee Farmer.

Curing Hams.—I beg leave to present to the public my manner of preserving hams. I turn my barrel over a pan or kettle in which I burn hard wood for seven or eight days; keeping a little water on the head of the barrel, to prevent it from drying. I then pack two hundred weight of ham in my barrel and prepare a pickle, by putting six gallons of water in a boiler with twelve pounds of salt, twelve ounces of saltpetre, and two quarts of molasses. This I stir sufficiently to dissolve the salt, &c, and let it boil and skim it. I then let it cool and pour it on my ham, and in one week I have smoked ham, very tender, of an excellent flavor and well smoked. When the weather becomes warm, there will be a seam rise on the pickle. By keeping my ham under pickle, it will keep the year round.

It is better to have a good white oak barrel than any other. Try it, and if you ever had meat smoked earlier after killing, and more palatable, please inform the public through the columns of your paper.

Yours, &c.
 H. FOWLER,
 Hanover, Mich., March 7, 1839

CHANGE OF FOOD.

There seems to be a natural disposition in man, in the brute, and in the vegetable, to a change or iteration of food, alike conducive to the gratification of the appetite and the promotion of health.

This propensity in man is apparent to all. That change is conducive to health, is evidenced by the fact, that persons long confined to the same diet are much more liable to disease than those who indulge in a variety. This is seen in long voyages and in the army, where men subsist daily upon the same rations. If there is any exception to the rule, it is where the food is of the simplest kind, as in the case of the Scotch, the potatoes of the Irish, and the rice of the people of the tropics.

The general principle being admitted, or that a change is not prejudicial to health, how important is it to our comfort, and economical in regard to expense, to multiply around us the fruits, vegetables, &c., which are the subjects of garden and field culture, and to select for this purpose the best varieties; and these are undergoing constant increase and improvement by means of culture and selection. Every season brings to our notice new species and new varieties, particularly in garden productions, favorable alike to health and to innocent gratification. The tomato and the rhubarb, both of recent introduction to our gardens, are of this character.

"By means of new varieties," says Bishop, "the produce of our gardens and fields are not only increased in a ten fold degree, but the quality of the produce is increased in a still greater proportion, and the difference between varieties that have sprung from the same species, fit them for different purposes, different soils, situations and climates.—Thus in edible plants and fruits, we are supplied with an agreeable change throughout the year, and a difference in varieties that have sprung from the same species. Nothing is more obvious, on comparing original species with their varieties produced by culture, than that we, by means of the latter, enjoy a vegetable food far preferable to that of our forefathers; and as it is probably beyond the power of man, of cultivation, or of time, to determine the degree of excellence attainable by varieties over the species whence they have sprung, and as that degree is unknown, we are justified in regarding it as progressive, and to consider the introduction of a good variety as the sign or harbinger of a better."

The disposition of animals to change their food, is evidenced by their habits and their disposition to pluck a variety of herbage, and to select that which is new to them. That a change is condu-

together, not only contribute to the health and thrift of the animals depastured upon it, but that the product was greater, considerably, and exceeded that of the best old pasture grounds. From these facts Sinclair and others argue, that we ought, in stocking down our grounds, to avail ourselves of all the grasses that we can procure, and that our soil will nourish. Groom observes, that out of more than 200 grasses suitable to England, only one genus, the rye grass, has as yet received general culture; and that of 60 species of clover, only three or four have received attention. The presumption is, that many indigenous grasses which have hitherto escaped the notice of our farmers, would be improved by culture to as great an extent as the wild carrot, parsnip, cabbage, potato, apple, plum, peach, &c.

That the vegetable is improved by a change of food, is not only evidenced by the natural law of alternation, witnessed in forests and in cultivated grounds, but by the improvement which takes place from a change of seed. It has become a well established principle, that a change of seeds from one soil and from one district to another, is highly advantageous. We have had this particularly verified in the potato, where foreign seed, of like variety and size as that raised on our farm, produced in the same field one-third the largest crop. Growing from the same seed, without change, seems to be a sort of vegetable breeding in-and-in. The progeny seems to deteriorate in both cases, and ultimately to become worthless. Upon these principles we should not only recommend an alternation of crops, but a frequent change of seed, to ensure a healthy vegetable constitution and vigorous growth.—*Albany Cultivator.*

From the Cultivator.

WHITINGTON NEW WHITE WHEAT.

Albany, July 13th, 1839.

MR J. BUEL.—Dear Sir—In the month of March last, I received from my brother, Geo. C. Thorburn, two bushels Whittington New White Spring Wheat. From the high recommendation the wheat received at the Liverpool Agricultural Society of England, and its fine appearance, (a large white plump grain) I was induced to recommend it to our farmers, and would not sell over two to four quarts to any one person, (except in a few instances) in order to give this wheat a wide circulation through our country. I have reason to fear it is a winter wheat. From the circulars sent from England with the wheat, I sold it in good faith as a spring grain; I never gave it any other recommendation than its appearance.

the most handsome wheat we ever saw, which purported to be the Whittington; in consequence of which, and of its being represented to be a spring wheat, we sowed one bushel early in April. But it evidently is a winter grain; as only an occasional plant shows an indication of producing seed at this time, July 15. We are satisfied that the Messrs Thorburns, as well as ourselves, have been imposed upon by the foreign advertisements and circular which accompanied the wheat from London. We purpose to mow ours, in the hope of getting a crop from it in 1840.

[Remarks.—We had two bushels of the "Whittington New White Spring Wheat," and sold it to our customers for spring wheat, as the circular from England which we published in the N. E. Farmer described it to be: we received it from Geo. C. Thorburn, of New York. It was the finest sample of wheat we had ever seen; and thinking it very desirable to have it distributed as much as possible, declined selling over a pint to one person, except in a few instances.

We regret that we have been deceived in its character, and are willing to make all necessary satisfaction to those who have been disappointed in it.—The idea of mowing it, as suggested by Mr Buel, is a good one, as it may thus be made to produce a crop next season.

JOSEPH BRECK & Co.]

FREE MARTINS.—When a cow has twin calves, one a bull calf and the other to appearance a heifer calf, the last is called a *free martin*. It is a singular law of nature, and apparently limited to cattle, that twin animals so produced, are unfit for the propagation of their species. The free martin is to appearance a cow, exhibits at times sexual inclinations, and some have been known to receive the male, but always without effect. These singular facts led Dr Hunter to a physiological examination of their structure; and recently, Dr Allnatt, of London, has examined several with the same object. The cause of this singular animal phenomenon is found to result from a peculiar vaginal and uterine organization, which effectually prevents a conception. The expulsion of the urine was, in the animal examined by Dr A., propelled in jets rather than a continued stream, and a singular mal-conformation of the parts, on examination after death, satisfactorily explained the cause. Free martins work well in the yoke, are strong and kind workers together, or with another ox. When allowed to mix with the bull of the same breed,

NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, AUGUST 7, 1839.

TO OUR SUBSCRIBERS.—We gave notice in the closing number of the last volume of the N. E. Farmer, that we should issue the paper once a month or oftener, in an enlarged form. We engaged our paper, but found that it could not be printed so as to fold in any regular order; we were obliged therefore to send it out in a most awkward shape. As we are disappointed in this arrangement, we have concluded that it would, perhaps, be as well to publish occasionally an extra, particularly at the time of the cattle shows, and at the season of the year when advertisements press upon us, &c., which we trust will give equal satisfaction. J. B.

BEET SUGAR.

We perceive by a recent number, that our neighbor the publisher of the Yankee Farmer, proposes forming an association for the purpose of ascertaining the practicability and advantages, if any, of the manufacture of sugar from beets in this country, by the latest and most improved methods. Especially he is desirous of determining whether it can be so managed, as has been represented, that every farmer's family in the country may, by a simple household practice, supply their own wants. We most heartily wish him all possible success. How far the calculations which he has given to the public in relation to this matter, are to be relied on, we are not able to say. But the funds asked for are a small affair compared with the importance of the object in view; and, divided as they will be, cannot fall heavily, even if the project should fail. But success is highly probable.

The sugar beet is beginning to be much cultivated in various parts of the State. We have seen considerable fields of it in many places; and trials of it as feed for cattle and swine, have served to bring it into favor. A company is prosecuting the cultivation of it, as we have been informed, to a large extent in Michigan, with a view to the manufacture of sugar. One spirited individual has informed us that he has one hundred acres in that State devoted to sugar beet. The present year therefore, will probably decide what can be done.

There are facts in regard to it now existing in France, which we find it difficult to reconcile to statements which are constantly made in respect to the manufacture in that country. The first is, why if the cultivation and manufacture are as profitable in that country as is represented, they require so heavy a duty upon colonial sugar in order to protect the manufacture of beet sugar. The second is why, if the new methods recently discovered are successful, and by them the sugar can be produced at a low rate, they are not at once adopted, and the government protection rendered unnecessary. An intelligent gentleman, sent out by the Northampton Beet Sugar Company, for the express purpose of obtaining all necessary information in relation to the matter, informed us that Shutzenbach's method upon trial in France was not approved. Fleischman in his interesting report to Congress on this subject, states the discovery of a method of extracting the sugar from the beet, by which a considerably larger amount of sugar was obtained than by Shutzenbach's method, at a less expense, and in a way which would place the manufacture within the reach of every farmer's family in the country. It is now full time that we should have received the result of experiments made by this method. Probably they have been made and others are in pos-

session of the results. We have not been so fortunate. Shutzenbach's method, as we have been informed by persons who were not proprietors in the concern, has been tried at Northampton with success. We have seen a sample of the sugar made there, which promises well; but can give no particulars. More than a year since we mentioned the discovery of a method of extracting and manufacturing the sugar by a gentleman at Stonham, in the vicinity of Boston, which promised the advantages of general practicableness, small expense, and a large per centage of sugar from the amount of product. We saw the sliced and dried beets; the mode of obtaining the syrup; the crystallization of the syrup, and the sugar perfected, but not refined—certainly a beautiful article. For the amount which could be obtained from the beet by this process, and which was represented to be from eight to ten per cent, and for the expense required in the extraction and manufacture, we relied upon the testimony of the operator, whose integrity is beyond a question. We deemed it a most important discovery, and after a patent for the manufacture had been obtained, we had great pleasure in announcing it. We thought the vessel had not only entered the harbor but actually reached the wharf; and were quite disposed to throw up our hat with the farmers and give three cheers. But it seems to have been a phantom ship or a sort of "flying Dutchman," for we have not been able to obtain a word farther on the subject.

The matter deserves all the attention which any among us seem disposed to give to it; and we wish our neighbor all the best sugar he can need in his tea and coffee the rest of his life, sweet creature as he must become, if his useful project should prove successful.

H. C.

BUTTER.

There is no article in our market or on our farms, in respect to which there is more just ground of complaint than butter. In few cases is it found fresh and sweet. In most cases, we speak particularly of public houses, it is absolutely detestable; and often comes upon the table "daubed over" in a manner thoroughly disgusting. How we are to find a remedy for this evil it is not easy to see. It is difficult to induce a patient to take medicine, who has not the slightest consciousness of ill health, or to submit to an amputation when they have never felt any pain in the limb; or to speak more plainly, to induce those persons to wash their faces who never look in a glass, or who perhaps in the course of their lives never yet saw the true color of their skin. We are determined, however, as often as convenient, to throw in our nitre, and protest against the manner in which this article, which is almost a first necessary of life, is made, kept, and served up.

We might have good butter if we would; but with our usual modes of management, it is not surprising that things are as they are. The milk is not always drawn clean; and impurities find their way into the pail which no strainer will take out. The pans into which the milk is poured are not always thoroughly cleansed and scalded, and dried before using. The dairy room is oftentimes ill-placed and badly ventilated; and frequently made a general receptacle for broken meats and dirty dishes, and the nameless and miscellaneous fragments of the table. Then too, the cream is kept too long before churning; the butter is imperfectly worked; the article is oversalted; and put to be kept in a place where there is little or no difficulty in its soon passing into a state of rancidness.

The farmers have no excuse whatever to offer for poor butter. They might have good butter always.—There is encouragement enough given in our markets. The butter of some farmers who send weekly to Bos-

ton, commands always thirtyseven and a half cents per pound; and if they could send a thousand pound week they would find a ready market for the whole lot. The butter sent in for exhibition and premium brings usually from thirtythree to fifty cents per pound. Our farmer within our knowledge, has for years received fortyfive cents per pound for his butter through the whole winter season. Can farmers ask any better prices than these? and why should any farmer consent to be outdone by his neighbor, if he has the spirit of man? Perhaps however, this matter belongs more justly to the "appropriate sphere" of women. We shall say nothing uncivil to them most certainly; but we hope at least they will hear what we have said to their husbands.

We occasionally hear housekeepers remark that they buy a cheap butter, because it "will answer well notwithstanding cooking." We always mark these people; and desire to keep clear of their cookery. Nothing should answer for cooking which is not entirely sweet and wholesome: and rancid butter is poison, let it be disguised as it may be. Poor butter in the market ought never to find a sale; and in spite of all the noisy discussion now ringing in the public ear about sumptuary laws, we maintain, without compromise or abatement, that use of spoiled butter for food, ought to be made an indictable offence. H. C.

Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, Aug. 3d, 1839.

By John Towne, Esq.; some fine pot plants; among them we noticed Fuchea tenella, Bonardia triphylla, Erica cuneata, do. multiflora (?), do. verticillata, Mesesia acerulea, and Erythana cristagalla.

Madam Eustis, of Roxbury, presented some fine specimens of Carnations; some three or four of the flower were equal if not superior to any exhibited at our rose the present season.

From the grounds of Thomas Lee, Esq., of Brookline, fine specimens of Roses and other choice flowers.

We welcome the scholars of Stephen M. Weld, Esq. of Jamaica Plain, Roxbury, to our rooms. Their bouquet was such an one as we should expect from youthful lovers of Flora and her handmaids.

Dolichos, by Col. M. P. Wilder, of Dorchester, via Birmingham Victor; *Striata formosissima*, Zeno, M. A. A. Broadwood, Squibb's Prima Donna, and *Sphaera elegans*.

From Mr. J. L. L. F. Warren, of Brighton; Madon Weller's Mary, Napoleon, Royal William, Smith's purple, and Duke of Wellington.

Striata formosissima, in the collection of Mr. Wilder was greatly admired. We were much pleased with Madonna, in the stand of Mr. Warren.

Native Plants, by Ezra Weston, Jr., Esq., and Frank Parker; *Clethra Alba*, *Asclepias verticillata*, *Sabbia chloroides*, *Gerardia flava*, *Polypala sanguinea*, *Lysichiton ciliata*, *Euphorbia maculata*, *Cephalanthus occidentalis*, *Orchis floribunda*, *Solidago lanceolata*, *Dactylis stramonium*, *Mentha borealis*, *Eriophorum angustifolium*, *Cuscuta Americana*, *Spiraea tomentosa*, *Spiraea alba*, *Eriophorum purpureum*, *Lebe pallda*, *Hedysarum paniculatum*? *Mimulus ringens*, *Drosera tenuifolia*.

By G. Gilbert, Esq.; *Sabbatia chloroides*, *Ceropegia rosea*, *Stachy's hyssopifolia*, *Polygala rubella*, (2 x h. radical flowers), *Gnaphalium margaritaceum*, *Crotalaria sagittalis*, *Asclepias tuberosa*; all from Plymouth, Mass.

By Wm. Oakes; *Sabbatia chloroides*, do. flower white; *Stachy's hyssopifolia*, *Polygala rubella*, *Asclepias tuberosa*, *Drosera tenuifolia*, *Lycopodium alopecuroides*, *Ceropegia rosea*—all from Plymouth, Mass.

Bouquets from Messrs Winships, Hovey & Co., Howe, Jno. Hovey, and Sam'l Walker, of Roxbury.

For the Committee,

S. WALKER, Chairman.

Vegetables exhibited Saturday, August 3:

By Mr. J. L. F. Warren, Brighton; fine specimen of Tomatoes and early shelled Beans.

For the Committee,

AARON D. WILLIAMS.

NOTICE.

Our subscribers in Hartford, Conn., and vicinity, will please refer that we have appointed Dr. E. W. BULL, Agent for N. E. Farmer. **JOSEPH BRECK & CO.** August 7.

RIGHTON MARKET.—MONDAY, August 5, 1859.

Reported for the New England Farmer

At Market, 150 Beef Cattle, 160 Stores, 35 Cows and Calfs, 1825 Sheep, and 150 Swine

Prices.—Beef Cattle—In consequence of the limited number at market higher prices were obtained and we raise our quotations. First quality, \$8 50 a \$8 02. Second quality, \$7 75 a \$8 25. Third quality, \$7 00 a 50.

Stores—A very few sales only, probably owing to absence of purchasers.

Cows and Calves—A large proportion at market were from Canada and of an ordinary quality. We notice sales at \$25, \$33, \$38, \$45 and \$55.

Sheep—Sales quick and at higher prices. Lots \$2 00, \$2 50, \$2 50 and \$2 75. Withers \$3 00, \$3 50 and \$4 00.

Pigs—Dull and prices still on the decline. A lot small pigs, prime quality, were sold for 7c. At retail from 7 to 10.

THERMOMETRICAL.

Reported for the New England Farmer.

Sunday,	4 64	78	68	S. W.

New York Urate and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are not divided among the Stockholders, as those belonging to another establishment, but sold, to applicants, for cash on delivery. Orders are supplied in the form or time in which they are received. Urate 50 cents and drate 40 cents per bushel, with contingent charges for barrels, &c.

The company are daily preparing for use, during the dry, weather, the materials collected during the past year, and will have several thousand bushels ready before the first of October next. The material is disinfected and freed free from offensive smell, by a compound, every use of which is to itself a good manure.

The success of the past and present years, 1838 and 1839, on Long Island, has satisfied many of the farmers of these manures have the quickest operation upon vegetation, producing greater abundance, and the cheapest any manure they have ever tried.

Directed instructions for their use, the result of practical experience, will be furnished on application. The effect of Urate upon Grape Vines and Morice Multicaulis is beyond comparison.

This company are erecting large and extensive works in vicinity of the city of New York to prepare the manures. Farmers and gardeners may confidently rely on a supply, orders, post paid, directed to "The New York Urate and drate Company," Box, No. 1211, Post Office, New York.

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake. For sale by **JOSEPH BRECK & CO.**, 51 and 52 North Market Street.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by **JOSEPH BRECK & CO.**, 51 & 52 North Market Street. July 10.

DORKING FOWLS.

For sale, a few pair pure Dorking Fowls. Few breeds, I apprehend, have a title to boast of so high and long continued a reputation as the Dorking. The Dorking are a species generally made into Capons."—Monday on Poultry. July 21

These fowls attain to a large size, and the hens are good layers. Price \$3 per pair. Apply to **JOSEPH BRECK & CO.**

MISCELLANEOUS.

LOVING LOVE LETTER.—The following epistle from a damsel in Illinois to her "lover" in Pennsylvania, is warm enough to melt wax. Its tender, touching, and transporting pathos, must have so affected "my sweet henry, my turkle dove," that he must at once have exclaimed, in the pathetic language of his "dearest deary," "i must git marrud, becase i've let it run on to two long already!"—*Boston Transcript.*

"SUSPENDERSBURGH, Away in the Ill-you-noise, Aprile the 2th.

1,000—eight hundred & 30 nine.

My Deer Dere Henry—i embrace this present opporchunity to let you know as how i am had a spell of the aigur, and i hope theas few lines may find you enjaving the same Blessin. Why dont you only rite I sweate Line to tell your sufferin Kathrun all about her pretty sweet henry. Oh my sweet henry—my turkle dove—my piging—my deer deare henry—how my pore sole is longin for yore sweet voice—think i hear him singin yan-ky Doodled as he kums from his plow now. Mary melden has got a baba! Oh my deer henry do cum on and lets git marrud. So no more at present, but remain your loving

KATHRUN AN TILDEN.

To my sweet henry.

P. S. Part Sekkund. Jeems Baslett has razed a noo house, and Sally does live so Snug—but she fites him sumtimes when he's a little Anthony over. My sweet henry let us keep house, and if you luv me, i wont whip you indeed, nor i wont look at no-body else, so i wont. Daddy sais as how i must git marrud, becase i've let it run on too long already. So no more at present.

K. A. T.

P. S. Part Thurd.

my pen is bad my ink is paill,

CATHRUN AN.

To my Dere henry over the Nallyganee in the Pensilveeny State."

Discovery of a New Medicine.—A medical practitioner at Andover, who attends a friendly Society at Chute, Wilts, for a low salary, gave one of the members a box of pills for some illness with which he was afflicted. By some chance or other, who about to take one, he thought it felt rather hard, and was tempted by curiosity to divide it in halves, when he discovered, to his astonishment that his pills were peas. To be fully convinced of the fact, they were, after having been weighed and deprived of the magnesia with which they were enveloped planted in the earth and are now actually growing. This statement was made by one of the stewards of the society.—*Eng. paper.*

A gentleman died lately in Bradford, Eng. who bequeathed five hundred pounds sterling to his widow, on the condition that she should marry again within six months after his decease. She is said to be handsome in person, and of an amiable disposition—and it is thought she will have no difficulty in finding a person who will be willing to assist her in fulfilling the condition of her husband's will.

Cold Water.—Do not drink cold water in large draughts, while you are overheated by exercise or labor, this hot weather. It is an old caution, and time honored. We repeat it because it is good, as was proved yesterday, when seven cases of prostration occurred, (from drinking water, cold from the pump) which demanded medical assistance. We may add another word of advice, on this subject. There is nothing more refreshing, when the body is heated by exercise, than to immerse the wrists in cold water, for two or three minutes; and if the body be ever so much heated, this precaution being taken, cold water may be drank with impunity.—*Boston Transcript.*

Cancer.—Mr Thomas Tyrrell, of Missouri, says he has effectually cured himself of an obstinate cancer, by the free use of potash made of the ashes of the red oak, boiled to the consistency of molasses, and applied as a poultice, covering the whole with a coat of tar." Two or three applications, he says, will "remove all protuberances, after which it is necessary to heal the wound by common salve." This is a cheap and easy remedy, the efficacy of which should be tested by those afflicted with the disease, which has hitherto baffled all the arts of medicine.—*Carlisle Expositor.*

Swan Travelling.—Travelling now should no longer be called travelling,—journeying transitions are more like flying,—the old name carries too low a signification with it. A Mr Hall, who returned in the Great Western, had been absent from Boston only forty days. In this time he has visited Great Britain, transacted business in several places in that country, and come home in a passage of 16 days. This is pronounced a degree of expedition without a parallel.—*Salem Observer.*

Remarkable effects of electricity.—A man was recently killed by lightning in Keene, N. H. while at work on the roof of a house.—The sun was shining bright at the time, and the sky was clear, with the exception of a heavy cloud lying at a distance in the south west.

Another most singular occurrence happened between Charlestown and Walpole. The chains connecting the leading horses of the stage with the pole, were broken by a flash of lightning, and the horses were detached from the stage—no one injured; indeed the horses escaped without injury.

A handsome Compliment.—Among the regular tourists drunk at the celebration of the Fourth, at Ithaca, N. Y. we find the following very pretty compliment to the ladies:—"Woman: there's a purple half to the grape, a mellow half to the peach, a sunny half to the globe and a better half" to man."

What is the use of one's being dissatisfied with his or her earthly lot? When the voyage of life is ended, it will make no difference whether we have enjoyed the accommodation of the cabin, or been compelled to submit to the humble fare of the steerage.

The great designs that have been digested and matured, and the great literary works that have been begun and finished in prisons, fully prove, that Tyrants have not yet discovered any chains that can fetter the mind.

Excitement.—A man drinks three glasses, and he is in a state of excitement. A person receives a box on the ear, and he is excited. You stick your elbow into a fellow boarder's soup at table, and he is excited. You kick a man with a sharp-toed boot, and he is excited. You pull his nose and spit in his face, and he is excited. In short you can do nothing in the world without creating an excitement—save one thing; hire a man to saw wood by the day, and such an example of christian patience as he will exhibit, is enough to kill old folks.—*Boston Herald.*

Economy.—Buy a peony's worth of dried apples in the morning, and eat one-half of them for breakfast;—at 11 o'clock take a fine drink of water, which will cause the apples in the stomach to swell and answer for a lunch. At 2 o'clock, eat the remaining half for dinner, and at any hour you may desire supper, take another drink of water, and you will accomplish the purpose as you did for a lunch. You will thus have four meals a day, costing but one cent for the whole, which we consider the quintessence of economy.—*N. Y. Sun.*

STRAWBERRIES.

Those who are desirous of cultivating this delicious fruit are respectfully informed that the subscriber has succeeded, after a number of years experimenting upon the Strawberry, not only in obtaining new varieties, but in ascertaining the best method of cultivation.

Specimens of the fruits grown in his Garden have been exhibited at the Horticultural Society's Rooms the four past years, and are also too well known in Faneuil Hall Market to need a particular notice here.

He has for sale at his Garden in Brighton, Mass., the following eight varieties of Plants. They are of superior stock and quality, all warranted to be truly named and free from the mixtures often found in those offered for sale promiscuously.

Those who are in want of Strawberry Plants, are respectfully invited, and they will find it interesting, to call at the Garden and see the manner of cultivation. The method of cultivation, and any information desired will be cheerfully given.

The subscriber would state that from many years personal experience, he is satisfied that plantations of these vines made the last of July or early in August, by careful and constant attention will produce nearly or quite as much fruit the season following as those plantations made in the Spring will produce the second year.

Warren's Seedling Methuen.—A new and valuable kind A free bearer, fruit very large and juicy; fruit measuring four and a half inches have been exhibited the present season.

Methuen Castle.—Fruit extremely large, high flavored and showy. Specimens of this kind have been exhibited at the Horticultural Rooms for two years past, measuring five and a half inches in circumference.

Bath Scarlet.—Fruit large, full bearer, and beautiful scarlet.

Early Virginia.—This is considered the earliest fruit—free bearer, hardy, and very early; decidedly a fine kind for market.

Royal Scarlet.—Fruit long oval shaped and juicy.

Houthois.—Fruit smaller but very numerous.

English Wood.—Fruit well known.

Monthly.—Fruit is gathered from the vines from June to October in great quantity and fine quality.

Orders left at the Garden, or directed to the subscriber, Brighton, Mass., or left at Messrs J. Breck & Co's Agricultural Warehouse, Boston, will be carefully and promptly attended to, and all PLANTS will be carefully packed and forwarded agreeably to directions.

JAMES L. F. WARREN.
Nonantum Vale, Brighton, Mass. July 17. jfsw

FOR SALE.

A splendid Oleander (Nerium variegatum) five or six feet high. One of the finest we have ever seen. For particular inquire of C. H. B. BRECK, or JOSEPH BRECK & CO. 51 and 52 North Market Street.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay weekly sixty days from the time of subscribing are entitled to a deduction of 50 cents.

From the Cultivator.

THE SUGAR BEET—QUERIES.

Gulfard, near White-Post P. O.

Clark Co., Va., July 3, 1839.

DEAR BROTHER—Sir—I have recently become a subscriber to, and a constant reader of your valuable and interesting paper, the Cultivator, and as I have been desirous of obtaining more information respecting the culture of the sugar beet, I am sure it will give you pleasure thus to disseminate information, by diffusing useful know-

ledge. My family being about to commence farming on what we consider here as a small farm of 200 acres, which, in ordinary sea-son will produce five or six barrels of corn, or two or fifteen bushels of wheat to the acre, wish to combine with it the culture of the sugar beet; after inquiry, it shall be advisable to do so. My land is a limestone land, of a light soil, and the cleared land much exhausted by excessive cultivation, un-lasted thirty years, when it changed hands, since then has been gradually improved to the above mentioned. The part in woods con-sists of black oak, white oak, hickory, walnut and ash. In this description of our lands, you will, per-haps be able to decide whether they are adapted to the culture of the sugar beet.

A letter published in the National Intelligen-ter, some months ago, from Mr Ellsworth, the owner of patents, he stated that an acre of good soil could produce twenty tons of the sugar beet, worth one dollar, or make 3,600 pounds of sugar, worth cents per pound. Now if our lands would produce half or a fourth of that quantity, it would be infinitely better for us to go to making sugar at- instead of raising corn and wheat at a heavy ex- pense, while the seasons are so precarious and the price so fluctuating.

As stated in a report on "root culture," in the number of the Cultivator, for 1833, that the high state of perfection and of profit, in the sugar beet business has arrived at in France and Germany, that the culture of this beet will soon be generally gone into in this country, for the pur- pose of raising sugar.

5th. Do you know of any individual or company in New York or Pennsylvania, or even nearer to me, that is engaged in the manufacture of sugar from the beet?

6th. Can you inform me what such a manufac-tory would cost, and whether it is worked by water, steam or horse power?

7th. What is the practice in France or Germany, amongst those who cultivate the sugar beet, in re-gard to its manufacture? Does the farmer make his own sugar, or are there public establishments, like our mills, and the manufacture of the beet a distinct occupation from the raising of it? Since the plan of kiln drying the beet has been adopted, it would, I presume, bear transportation to market as well as other products.

8th. Is there any French or German work (trans-lated into English,) on the subject, in the bookstores of New York or Philadelphia, that you can recom-mend?

Any information, not embraced in the above in-terrogatories, which may be deemed pertinent to the occasion, will be, I assure you, sir, most thank-fully received, by your very obt' and humble serv't,
JAMES M. HITE.

ANSWERS.

We are not practically acquainted with the beet culture or the manufacture of beet sugar. We have published in former volumes, the best information we could obtain; but the business has been under-going constant improvement in France and Ger-many; and it is upon this improved management, the details of which have not yet been made known to the American public, sufficiently to guide in the practice—it is upon this improved system of man-agement that Mr Ellsworth has based his calcula-tions. We have no doubt but the business will be ultimately introduced and made profitable, when judiciously managed, and we have as little doubt that it will prove to many a losing concern. We would rather be a follower than a pioneer in it.—Inviting from correspondents a more general an-swer to Mr Hite's queries, we will content ourselves for the present, with responding briefly to some of his inquiries. And,

1. The best time and mode for preparing land

Mr Hite our impression, that the climate of Virgini-a is not well adapted to the culture of the sugar beet—that it is too far south—the root in the south of France being far less rich in saccharine matter than that grown in the northern departments. We do not pretend to determine the beet zone; but we are inclined to think, that upon our Atlantic bor-der, it is north of 42°.—*Conduc. Call.*

On the Influence of Native Magnesia on the Germination, Vegetation, and Fructification of Vegetables. By Angelo Abbene.

Among the various causes which produce bar-renness in lands, has been enumerated the presence of magnesia, because it had been observed that the various magnesian soils are sterile. This opinion has begun to lose credit, since Bergmann, who ex-aminated the composition of fertile soils, considered magnesia as forming one of their principal constitu-ents.

Prof. Giobert has performed a number of experi-ments to inquire into the action of native magnesia, which is found in numerous cultivated soils. In the environs of Castellamonte and of Baldissero, this substance is abundantly diffused in the soils cultivated with great success, and which exhibit a vigorous vegetation. There are many districts in Piedmont and elsewhere, where the bi-carbonate of lime and of magnesia is abundant in the cultivated lands, which produce beautiful plants. Giobert concluded from these experiments—1st, that native carbonated magnesia is not injurious to the various functions of vegetables; 2nd, that on account of the solubility of magnesia in an excess of carbonic acid, this earth can exercise an action analogous to that of lime; 3rd, that a magnesian soil may become fertile when the necessary manure is em-ployed.

From these facts naturally proceeds the conclu-sion, that if the magnesia was dissolved in an ex-cess of carbonic acid and water, and had entered like the lime into the composition of the sap, it ought to be found in the plants with the potash, lime, oxide of iron, &c. M. Abbene has ascertained this by the analysis of the ashes of plants which had grown in magnesian soils.

its greater affinity for carbonic acid. 4th. In barren magnesian lands, it is not to the magnesia that the sterility must be attributed, but to the cohesive state of their parts, to the want of manure, of clay, or of other composts, to the large quantity of oxide of iron, &c. 5th. Barren magnesian soils may be rendered fertile by means of calciferous substances, as rubbish, chalk, ashes, marl, &c., provided the other conditions be fulfilled.—*Journal de Pharmacie de Janvier, 1839.*

[For the New England Farmer.]

TO THOSE INTERESTED IN THE INTRODUCTION OF BEET SUGAR IN THIS COUNTRY.

The subscriber proposes to persons wishing to become acquainted with the manufacture of Beet Sugar, and having a few tons of beets for that purpose, to go on their premises with suitable apparatus and manufacture the sugar, without putting them to any hazardous expense for tools, patents or machinery, provided, however, a reasonable compensation previously agreed upon should be made; in consideration of which persons so disposed would become perfectly acquainted with two of the best processes. The subscriber would however observe, that, profitable as the beet sugar is, or may become, he most invariably has obtained but 6 lbs. of sugar for 112 lbs. cleaned beet, and 3 lbs. of molasses for 112 lbs., instead of the 9 per cent. of refined sugar promised in printed reports. Whether this is owing to the quality of the beets or other causes, is unknown to him: but the similarity of produce from different lots of beets and at different times, convince him that it would not be prudent to calculate on more. Early application is requested, in order to accommodate all in proper season.

N. B. It would be preferable when convenient, if several persons would unite and have their beet manufactured in the same location, as it would save time and expense in moving.

M. DUROY.

Samples of different quality may be seen at the store of the subscriber, 310 Washington street.

[REMARKS.—We have called upon Mr Duroy, and examined his specimens of Beet Sugar. He showed us six samples of different qualities; he appears to understand himself in relation to the manufacture of the sugar. Although he does not make pretensions to obtaining so great a quantity from the hundred lbs. as Mr Fleichman's report states, yet we believe if any gentleman are disposed to make trial of his skill, they will be pleased with the result of his experiments, and form some estimate as to the probable success of this enterprise. From what we were told, it appears that every farmer will be enabled after witnessing the process, to manufacture his own sugar, and that too, without any very great expense for utensils or machinery. Should there be a small quantity of saccharine matter remain in the pulp, it should be remembered that it will not be entirely lost, as it will be so much more valuable for feeding stock. Mr Duroy has manufactured the sugar from dried beets, from beets newly dug in the fall, and from beets beginning to grow in the spring, and is of opinion that where a few tons only are to be manufactured, it is much the best to use them in the fall as they are taken from the field. The sample of sugar we examined, made from the dried root, was very dark, in consequence as we were in-

formed, of too great a heat being used in drying it. The specimen of crystallized sugar shown us was very beautiful. Mr Duroy is a native of France, but has been a resident here a number of years. Those who wish to obtain further information, will find him intelligent and disposed to communicate.

We hope the manufacture of sugar beet will not remain a subject to talk about and speculate upon merely, but one of immediate action. Let it be known, if possible, this fall, whether it can or cannot be done to advantage in our country. We know there are beets enough raised this year to make the trial—and if it cannot be made at the first onset a source of profit (which no one ought to expect,) some estimate can be made of its future success. J. B.]

From the Genesee Farmer.

DICTIONARY OF TERMS USED IN AGRICULTURE,

And in the Sciences most intimately connected with its advancement.

(Continued.)

CAMBIVM.—When the sap from the roots of trees has ascended to the branches, and undergone that peculiar elaboration which fits it for the formation of the various parts of the plant, fruit, wood, bark, &c., it descends towards the roots, depositing in its progress the materials destined to the several parts. Of these, the principal is the substance of the future albumin and liber. These materials are first deposited in the form of a layer of glutinous or gummy substance, termed the *Cambium*; which appears to consist of the solid portion of the sap, deprived of the greater part of the water. This becomes more and more consolidated, and becomes an integrant part of the plant, constituting two layers: the first, the outer circle of wood, called the albumin; and the other, the inner layer of the bark, being the liber.

CARBON.—The base of coal. It is found pure only in the diamond. Though this fact was suspected by Newton, it was not established till Lavoisier effected the combustion of the diamond enclosed in iron. As the diamond disappeared, and the iron was converted into steel, (a well known result of the combination of carbon and iron,) the inference was clear that the precious stone was pure carbon, and farther experiments have demonstrated its truth. Carbon forms the base of all wood, and consequently of all trees and plants; and is, therefore, one of the most important principles in nature. Plants, however, never take up the minutest quantity of carbon while in that state, however fine it may be reduced. By a wise provision of Providence, an inexhaustible reservoir of carbonic gas (carbon converted into air) is found in the atmosphere, which readily combines with water, and in that state is taken up by the roots for the support of the plant. The leaves of trees also perform a species of respiration by which carbonic gas is taken into the plant during one half of the day, to be decomposed by the solar rays, and while the carbon is retained, the oxygen is set free and thrown off by the plant to renovate and purify the air. Carbonic gas is composed of 27.4 parts of carbon, and 72.6 parts of oxygen. Carbonic gas is fatal to animal life, and to this gas, the deleterious effects of the Grotto del Cano, the Valley of the Upas, the craters of volcanoes in

some cases, what is called the choke damp mines and wells, &c. are owing. No part of a plant has the power of decomposing this gas, except those that are green; hence plants perpetually stripped of their leaves, are at once deprived of their greatest means of procuring carbon, must suffer accordingly.

CARROT.—(*Daucus carota*.) Few plants exhibit the improving effects of cultivation more strongly than the carrot. In its native state, it is dry, fibrous, white and strong flavored; as cultivated, it becomes large, succulent, and rich in nutritive proportions. Carrots contain a ten per cent. of nutritive matter, of which nine sugar and the remainder starch. Many attempts have been made to make sugar from carrots, they have failed; while by distillation large quantities of spirits are produced. Twenty tons yielded 240 gallons. Carrots require a rich soil, and on any others their growth should not be attempted. They succeed best in rows, 18 inches apart, and 8 inches in the rows. In shallow soil, or one rich only on the surface, the roots are scragged, and of an inferior quality. Five hundred bushels may be considered the average yield per acre on a good soil, though instances have occurred of yields of eleven or twelve hundred bushels on that quantity of ground. Few roots are of equal value to the carrot for feeding animals. The most all are fond of them, and their excellence cannot be disputed. They make the finest colored and best flavored butter or beef; hares thrive rapidly on them, and hogs can be fattened on them with ease. The carrot crop is not quite certain as one as the potato or turnip crop, is rather more difficult in the choice of soils, and more care and labor in the production is required; still it is one of great value, and where circumstances do not forbid, should always find a place among the roots grown, and rotation adopted by the farmer.

CART.—Fifty years since, the use of the wagon for farming purposes was almost unknown. The reliance was on the cart and oxen, instead of the wagon and horses. As the latter increased, the former gave way; and now, the use of the cart is almost confined to farms on which cattle alone are used, and to some particular sections of country. It is a question, however, which deserves serious consideration by farmers, whether more has not the whole been lost, than has been gained by change. On grain growing farms, where mowing and ploughing is to be performed, horses are indispensable, and the wagon of course may well be preferred; but there are tens of thousands of small farmers in our country, that, we think, would greatly consult their convenience and profit, by discarding their wagon and its attendant span or two lean horses, and substituting in their place, for labor, the old fashioned and less costly cart, or a yoke or two of clean built, light travelling Devon or other good working cattle.

CATARRH.—A disease of horses known under the names of influenza, cold, horse diatemper, &c. and is one of the most common and disagreeable to which this useful animal is subject. It is usually fatal, or long continued, unless the animal is judiciously treated, improperly worked while under the influence of the disease, or dosed with injurious remedies. It makes its attack usually in the spring or fall, commencing with fever, followed by discharges of matter from the nose, swelling the glands of the throat, difficulty of eating,

king, and of course much curcuation and sickness. Bleeding is admissible only during the fever stage; setons in the glands, or blisters on much swelled; promoting discharges from nose, and keeping the bowels open, have been and the most effectual methods of arresting the disease. The distemper is clearly contagious, and ceterd animals should be kept from those that sound as far as practicable.

CASTRATION.—The emasculation of animals, such as pigs, lambs, &c., should be performed as early as the strength of the animal, and other circumstances, will admit. Usually, the only care necessary is to prevent exposure to the cold. Where this is not attended to, serious consequences may result; and we have known flocks of sheep decimated by exposure to a cold ruin, immediately after this operation.

CATTLE: a general name comprehending all the animals in the genus *Bos* of Linnæus. There are numerous a number of species, such as *bos taurus*, the common ox; *bos capra*, the wild ox of Africa; *bos urus*, the wild bull of Asia; *bos americana*, the buffalo or bison of the Missouri; and the true buffalo of India, and the musk ox of the Arctic regions. Much labor has been expended in tracing the origin of our domestic races of cattle to the wild, but we think with little success. As the first mention made in history of the ox, he was the sheep, a domesticated animal, and such he is probably descended from the ark upon the plains of Mesopotamia. Domestic cattle become wild and roaminess, as the immense herds that roam the pampas of South America at the present time prove. Very great improvements have been made in the European breeds of cattle within a few years, principally in England, and that by a spirited individuals, of whom Bakewell, Colman and Berry, rank among the first. Within a few years, the average weight of English cattle, as determined at the Smithfield market, has risen from 1000 to 1500 lbs; and present appearances do not indicate that this increase has reached its maximum. The great improvements already effected, have been made by judicious crosses, and breeding with a view to certain desirable qualities of form, constitution, aptitude to fatten, &c., and these have been attained in some of the best modern breeds of cattle to an extent that would once have been deemed impossible. It is evident that much must be taken, or there will exist a tendency to degenerate to the original standard; a tendency which will become less and less, as the type and constitution of the improved breeds recede farther from the point of their origin, and of course, the

next to skilful breeding, the excellence of cattle is mainly depending.

CELLAR.—An important appendage to every dwelling is the cellar, and great care should be taken to have this so arranged that the full benefit desired from it may be obtained. The cellar should be well walled with stone or brick laid in cement; if inclining to be wet, it should be drained so as to present a hard, smooth surface earth, and this will be better if covered with clean gravel. Cellars should wholly exclude frost without being too warm, as fruit and vegetables kept in a warm cellar will not be as good as in one of an equally dry but lower temperature. Since the commencement of the cultivation of roots in this country to a considerable extent, and especially since the marketing of pork from steamed apples and potatoes has succeeded so well, cellars attached to barns or piggeries have become necessary, and are already constructed in many cases. Cellars of this kind for the reception of roots, should be made so that cart or wagon loads of fruit or roots can be thrown into them at once, without the labor of repeated handling.

CHALK.—Compact limestone, or carbonate of lime, passes into chalk, when the particles that compose the mass are so loosely connected as to render it friable or capable of easy division; in its essential qualities it does not differ materially from unburnt lime. Chalk is extensively used instead of lime for agricultural purposes in many parts of England where it abounds. In the United States there is no chalk, properly so called. The immense beds of white marl, found in some parts of Western New York, are a near approach to it, and the value of such beds as a resource for easy liming soils, will be better appreciated hereafter than it now seems to be.

CHAFF-CUTTER.—In European works on agriculture, straw or hay when cut fine for cattle or horses, and the practice is extensively followed, is called chaff, and the implements by which the cutting is effected is termed a chaff-cutter. In this country, the same implement would be a 'straw-cutter,' which see.

CHARCOAL.—The woody part of trees or vegetables, when burned without flame, becomes a black substance, which has received this name. The base of this substance is carbon, which is formed from the decomposition of carbonic gas by the roots or leaves of the plant. To produce charcoal, the wood is usually burned in pits, or the wood is first closely piled, and then covered with earth, which causes the wood when the fire is ap-

plied to the addition of acids of any kind, will convert milk into curd, but the substance used in the dairy, and which is preferred to all others, is a decoction of the stomach of the calf called rennet. This stomach is prepared by drying with spices and aromatic herbs, and when wanted, is steeped in water or whey, until sufficiently strong to coagulate the milk with readiness. Great care is necessary in preparing and preserving the rennet, as on the quality of this, its sweetness, purity, and flavor, much of the goodness of the cheese is depending. Many varieties of cheese have obtained great celebrity, viz. Parmesan, Stilton, Gloucester, Cheshire, &c., in Europe, and the Goshen, Orange, &c. in the U. States. The different qualities depend on the milk, and the different processes adopted in making the cheese. The best cheeses always retain the cream in the curd; those made from milk deprived of the cream is called skim-milk cheese. Cheeses made of goats milk are richer than those made of cows milk, but it is with difficulty they are kept for any time.

The celebrated French cheese called Rochefort cheese, is made of a mixture of goat's milk and cow's milk, and its peculiar excellence is supposed in part, to be owing to the temperature of the rooms in which it is prepared, which being excavated in rock, are always of the temperature of 36° to 40°. Formerly those dairies that made the rich or cream cheeses, such as the double Gloucester, Stilton, &c. were obliged to make them small, and the dairies of this country that imitated such cheese were compelled to do the same, as their rich and tender mass would fall to pieces of itself if made of large sizes. Now the richest cream, or double cheeses are made without difficulty, and of any desirable size, as the curd is pressed and kept in bandages made of thin cotton until ripened and used. The dairy business when well conducted, is a source of great profit, and the American dairies in some parts of the States are exceeded by few in the world for the quantity and quality of their products; a decided improvement having taken place within a few years.

CHEMISTRY.—A science which teaches the relation which matter bears to other matter, and the manner in which the laws of affinity, vitality and organization, perform their several functions. Agricultural chemistry is limited to a knowledge of the substances which enter into animals and vegetables, to serve them for nourishment; and to the study of all the agents which aid them in accomplishing these functions. Agricultural chemistry first assumed a definite form under the labors of Davy and Chautal, and though but a comparatively

[For the New England Farmer.]

From the Genesee Farmer.

MR BRICK—I sent you a short statement in reference to the profits of a farm, which was presented to your readers in the Farmer of June 18th: one item of expense was accidentally omitted. Although small in itself, it probably contributes, to say the least, as much as any other expense of the same amount, to the favorable results of farming. That the account may be finished, I give it you to be added to the Dr. side of the account:

N. E. Farmer one year	\$2 50
Binding one vol.	75

	\$3 25

It has been said that farmers are unlike those of other professions in being ready at all times to communicate their experience and results, in order to encourage their brethren and promote their welfare. I wish this was universally the case, and have no doubt that the item of expense above referred to, would aid in bringing about so desirable a distinction. A free interchange of opinions, whether derived from theory or practice, or both, is of mutual advantage, and an incentive to it will be found in a well-conducted agricultural paper, which every farmer should take—regarding the expense as a necessary, indispensable one.

Now and then we hear men say that they do not wish to become "book farmers." I have often heard the term used and have heard of some professedly agricultural paper using the term in a significant sense, and have as often been led to enquire what the term means. Can you enlighten me? If explained it may not be so great a bug-bear in the way of the farmer's profits. T.

Westboro, Aug., 1839.

[We do not recollect of seeing the terms *book farmer* or *book farming*, explained in our dictionaries, but suppose that *book farmers* are those who in their agricultural pursuits, are desirous to be instructed by the experience of others, as communicated through agricultural books and periodicals: they are not disposed to follow the mode of agriculture pursued by their fathers and grandfathers, without enquiring whether improvement may not be made in each department of their own profession; but as they look around them and witness the great advances made in every other profession by the diffusion of knowledge, they are led to conclude as a matter of fact, that knowledge applied to agriculture will produce improvement the same as when applied to the arts. We have a proof of this in the increased product of their farms, superior stock, fruit, tools, &c. It is not necessary that a "book farmer" should throw away the experience of his ancestors, but endeavor by reading, reflecting, and comparing, to improve upon their system (if they had one) and if possible excel them.

We often hear it said, "we do not wish to become book farmers"—it always give us pain, for we conceive that it is equivalent to saying, we are willing to go on in our business through life ignorant and blind to the improvements of others—satisfied to toil at arm's length an up-hill course, and having enough to keep soul and body together, we are content. It is astonishing that there are so great numbers in our country with so many facilities for improvement, yet groping in the dark. We have often been led to enquire, what shall be done to induce the farmers more generally to read.

J. B.

OBSERVATIONS ON THE CULTURE OF THE STRAWBERRY.

By A. J. DOWNING, *Botanic Garden and Nursery, Newburgh, N. Y.*

The strawberry is certainly one of the most valuable and delicious of all the smaller fruits. It is not only easily cultivated, yielding an abundant crop in a short time, from a very limited space of ground; but while its pleasant sub-acid flavor is agreeable to all palates, and forms one of the most delightful additions to the dessert in summer, it is also extremely wholesome, never, as is the case with most other fruits, undergoing the acetous fermentation. In some diseases it has even been found highly beneficial, and it is affirmed that Linnæus was cured of the gout by abundant use of the berries.

The strawberry, though a low herbaceous plant, sends down remarkably strong roots. In good soils these are often found to penetrate to the depth of eighteen inches or more in a season. It is necessary, therefore, to produce a fine bed, that the soil be deep as well as rich. Where the sub-soil is not positively bad, the ground is always much improved by trenching, (two spades deep,) before setting the plants. In doing this, a good coat of manure should be deposited between the two spits: old garden soils which have been long cultivated, are astonishingly improved by this practice, the whole becoming renewed by the presence of the fresh soil; and the growth of plants in such mould, when again acted upon by the sun and air, is of course proportionately vigorous. A deep mellow loam, rather damp than dry, is undoubtedly the preferable soil for this plant, but almost any soil for so limited a species of culture, may, in the hands of a judicious gardener, be rendered suitable for it. We have seen very splendid crops of fruit upon a very stiff yellow clay, well-wed down by mixing with it anthracite coal ashes and manure.

The best season for making new plantations of the strawberry is either in spring, at a pretty early period, or directly after the beds have ceased bearing, in August. If the latter time is chosen, the plants generally get sufficiently well established to bear a considerable crop the ensuing year.

There are various modes in which to plant the beds when formed. Some arrange the plants so as to be kept in hills, others in rows, and others, again, allow them to cover the whole surface of the bed. We consider the first method preferable, as in that way the ground can be kept cultivated between the plants; the fruit is generally larger and finer, being more exposed to the genial influence of the sun, and the duration of the bed is greater. Three or four rows may be planted in each bed, at a suitable distance apart, and the runners from the rows should be shortened or cut off about three times during the season. If the plants are not thriving well, a light top dressing between the rows in autumn will be of great advantage.—Turning off the upper surface of the bed in the spring has been highly recommended by some persons, but we have never found it to answer our expectations upon trial.

This fruit receives its name from the very ancient custom of placing straw on the beds, between the rows of plants, to preserve the berries clean. The custom is not yet too antiquated to be of less value to those who desire the fruit in its greatest perfec-

tion. Clean wheat or rye chaff may be substituted for straw, and it has the very great additional advantage of not only preventing most weeds from growing, by excluding the light, but also, by decomposing with considerable rapidity after the frost season is past, it contributes much to the enrichment of the surface soil of the bed. Young and strong runners well rooted, should in all cases be chosen to form the new bed, and not old plants, whose offsets which grow near them.

There is a fact with regard to the strawberry plant little known, the ignorance of which puzzles many a good cultivator. This is the existence of separate fertile and sterile or barren plants in many of the varieties, otherwise plants which produce chiefly male, and others that produce only female flowers. Botanically, the strawberry should produce both stamens and pistils in each flower, and the blossoms should consequently all mature fruit. This is really the case with the alpine, the wood strawberries, &c., but not entirely so with the large scarlet and pine strawberries. These latter sort it is well known, produce the largest and finest fruit; but we very often see whole beds of them in fine flourishing condition, almost entirely unproductive. The common parlance in such cases, that the variety has run out, or degenerated, but the idea is a confused and ignorant one while the healthy aspect of the plants fully proves the vigor of the sort.

The truth is, that in all strawberries of the foregoing classes, although each blossom is furnished with stamens and pistils, yet, in some plants the pistils are so few that they can scarcely be perceived; in others, there are scarcely any stamens visible. When the plants bear blossoms furnished with stamens only, (or in a large proportion,) they are of course barren; when pistils only are produced in abundance, they are fertile. To have a bed planted so as to bear abundantly, about one plant in eight or ten should be staminate or barren blossoming plants; the others the fertile ones—if the latter only be kept, they alone will also be found unproductive.

If any person will examine a bed of the Hudson or any of the large scarlet strawberries, when they are in blossom, he will discover a great number of plants which bear large showy blossoms filled with fine yellow stamens. These are the barren plants. Here and there, also, he will discover plants bearing much smaller blossoms, filled with the heads of pistils, like a small green strawberry. The latter are the fertile ones. Now the vigor of the barren plants is so much greater than that of the fertile ones, and their offsets are so much more numerous that if care be not taken to prevent this, they soon completely overrun and crowd out the fertile bearing plants, and to this cause only is to be attributed the unproductive state of many beds of the large fruited strawberries, which are in many instances perhaps, entirely devoid of fertile plants.

The proper method undoubtedly is to select few fertile plants of each kind, plant them in small beds by themselves, and allow them to increase freely by runners; then, on planting, the proper proportion could be made and kept up by the regular clipping of the runners.

Many of the fine English varieties of strawberry (Wilmot's superb, for instance,) are generally found worthless here. This is owing, in some cases, to the ignorance or want of care of those persons who export the varieties, in sending often, no fertile plants; in other instances, it is equally owing

our negligence here, in not preserving the due proportion of barren and fertile plants.

This peculiarity in the blossoms is very little known or understood, even among scientific cultivators. It was first pointed out to us by our esteemed friend, N. Longworth, Esq., of Cincinnati, one of our most distinguished Western horticulturists. Its truth we have repeatedly verified, and a slight examination will convince any person of the cause of the numerous worthless yet thriving looking strawberry beds throughout our gardens.

The finest of the large English varieties of this fruit which we cultivate here is the Bishop's. It is remarkably large, a most abundant bearer, and of superior flavor. Many of the larger berried sorts, as the Methven Castle, have been hollow and comparatively tasteless, though of uncommon size.—This variety, however, appear to us to unite all that can be desired, to constitute a truly fine and delicious strawberry.

A. J. D.

SILK.—Incredulity as to the possibility of raising silk in this country, must, we should think, give way, if facts have any force. It has long been contended by gentlemen who have investigated the matter, that silk might be as easily raised here, and of as good quality, as any where in Europe.—Every experiment, judiciously conducted, has proved the truth of this conviction. We have now almost before our eyes while we write, another demonstration of the practicability of the silk culture in our climate. Dr Deane, of this village, has in the course of rearing, about 40,000 silk worms.—This we believe is the first attempt in this town. Some of his brood have spun their cocoons, a part of which have been reeled and made into very beautiful raw silk. The reeling was performed on a common reel, by a young gentleman, as a temporary amusement. We advise all who are curious in the matters, to call at the doctor's. They will probably see specimens of the business from half to full grown worms; feeding and winding cocoons, together with cocoons ready made, and the raw silk procured from those that have been reeled.

There can be no doubt that the silk business is a profitable one when properly managed. In the first place it is entitled to a bounty of 10 cents a pound on cocoons and a dollar a pound for reeled or raw silk, which is about equivalent to two dollars a pound, where one person raises and reels the cocoons—and this will just about pay the expense attending it. The market price is about five dollars a pound, which will be mostly clear profit.—What better business than this can a man find?—*Greenfield Mercury.*

ing, a worthless intruder that occupies the ground exclusively where it spreads, and that is rapidly, when it is once allowed a foothold. See that this weed is effectually demolished wherever it appears. Look on your spring sown grain, and if it is full of yellow blossoms, you will probably find that clark-look is in your fields, and if it is not pulled promptly and completely, you may find business for years in attempting vainly its extirpation. The crow-foot of your meadows, or the daisy of the pastures, must be looked to, else lean cattle may be expected when fat beasts should be looked for. In short, allow nothing to be in your fields that usurps the place of more valuable plants, lessens the amount of your crops, or renders your fields a place in which pests are multiplied to reduce your own profits or vex the souls of your neighbors.—*Genesee Farmer.*

GRAIN PLANTS.—The growth of the wheat, both winter and spring wheat, barley and oat plant, this year, is on the most magnificent scale, approaching to the luxuriance of the tropics. Wheat from six to seven feet in height, not a few stalks only, but whole fields; oats which in size already resemble the cane brakes of the south, and are still towering upwards; barley on the same scale of rapid growth; in short scarcely a cultivated plant, with the exception of corn, (and this is now coming on finely) that does not exhibit the same aspiring character. There is now, (July 22,) every prospect that the barns and the granaries of the husbandman will be filled to overflowing. The wheat crop as far north as Pennsylvania has been secured, and in good condition; and from every account is better than a medium one. Wheat in Michigan, and some parts of Indiana, has suffered much from insects; in some districts of these States the crop will be almost a total failure. This is particularly to be regretted, as the financial condition of the West required the aid of good crops to restore prosperity, and a healthy sound state of things in that respect.—*Genesee Farmer.*

From the Cultivator.

EXTIRPATION OF GARLIC.

Montcalm, Va., June 21st, 1839.

J. BUEL, Esq.—Sir—The extirpation of wild garlic has been regarded rather as an object to be desired by the agriculturist, than one to be successfully accomplished. An experiment, made by myself, not with that view, however, will at least point out one mode by which this unpleasant plant may be destroyed. In one-third of a field of about

eating the garlic. In the spring, I sowed the field in oats and clover. The oats were good; the clover was destroyed by the burning drought of last summer; thus leaving the field entirely naked. I then determined, (last fall,) although the fourth crop in succession, to sow it in wheat, which I did, and this spring in clover and timothy, a full quantity of each. Now, sir, I have in the last fortnight, repeatedly and carefully searched for the garlic, and found two stalks only, where thousands stood before. The garlic is now in full bearing, and may be easily detected.

It is manifest that this method of destroying this pest will not generally answer. But the idea may be improved on. If a farmer have but one field of corn, and garlic prevails in it, he may gather nearly the whole of it, and instead of seeding it, as is the usual practice, let him turn in all his hogs that are to be kept over to the next year, and they will soon get hold of the roots, &c. He will then put in a spring crop with grass seed. So well satisfied am I with the result in this case, that I shall pursue the same plan in respect to two other fields in which there is a good deal of garlic. It will occur to you, that the ground being light and mellow, from the recent cultivation of the corn crops, the hogs have no difficulty in finding the bulbs, which they will not attempt in a field well set in grass or stiffened with a sod, although abounding in garlic, and this for two reasons: they have a plenty to eat, and with less labor.

Yours, &c.

JAS. McILHANY.

Early rising is conducive alike to health, to pleasure, and to profit—we mean to the farmer.—To health, because it gives exercise when the atmosphere is most cool, pure and bracing. To pleasure, because nature is then in her most lovely garb, and the birds most full of song. To profit, because the two morning hours effect more in labor and avert more mischief than four hours at midday. Early rising and exercise in the open air, are the best stimuli for our meals, the best anodyne for sound sleep, the best salve for care, and the best evidence of thrift. "Come boys," is the best reveille upon the farm. The farmer who rises late is generally behind his work; while he who rises early keeps before it.—*Cultivator.*

Comparative value of large and small turnips.—We have frequently alluded to the fact, that the ruta бага is the only cultivated root that increases in nutritious properties as it increases in size.—Sinclair found, on analysis, that a root of the common turnip, measuring seven inches in diameter,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, AUGUST 14, 1839.

MASSACHUSETTS AGRICULTURAL SOCIETY
PREMIUMS.

The list of premiums offered by the Massachusetts Society for Promoting Agriculture, have been given to the public in the columns of the N. E. Farmer, and circulated on a separate sheet through the State. We hope they will excite the attention which they justly demand, and lead to an animated competition. They are drawn up with good judgment; the subjects of premium are well selected; and the conditions in every respect liberal to an extreme. Our only regret is that their appearance was unavoidably delayed to so late a period in the season. On this account they may not be seen by some who would otherwise have been competitors, and others may not have cultivated crops which they would have cultivated or in the manner they would have done, had they known what would have been the subjects of premium. In respect to most matters the notice is sufficiently early to do all that is required to be done.

It will be seen that the Massachusetts Society have placed a portion of their premiums amounting to nearly four hundred dollars, at the disposition, in conjunction with a committee of their own body, of the Worcester and Berkshire Agricultural Societies; and to be bestowed upon articles or subjects suggested by the Trustees of these societies, and at their respective cattle shows. These premiums are open to competitors from any part of the Commonwealth, who will conform to the regulations of the local societies. This is an excellent arrangement. It ought to conciliate the favor of the farmers of the Commonwealth towards the State Society, whose proceedings from its foundation have been exceedingly liberal and generous, and in a degree it is a good substitute for the show at Boston, which the society has judged it best to internit now for three or four years.

It will be seen in the next place, that the very liberal premiums offered for dairy produce, amounting in four premiums to two hundred and sixty dollars, are open to competition from any state in the Union; and the large premiums of one hundred dollars for a perfect remedy against the horst borer, and the premium of fifty dollars for a remedy against the apple tree borer, and the premium of fifty dollars for the best treatise on the cultivation of the mulberry, and of thirty dollars for the best subsoil plough, and of twenty dollars for the invention of any valuable agricultural machine, are open to any and to all persons. This evinces great liberality; and will, we hope, attract the attention of the ingenious, skilful, and practical throughout the country. We hope that agricultural papers at least throughout New England, New York, New Jersey and Pennsylvania, will publish these general and unrestricted premiums and invite competitors from among their own subscribers in their own neighborhoods.

It is to the highest honor of Massachusetts that she has made from an early period, the most liberal provision for the encouragement of agriculture; and it is believed that, with the exception of the Society for promoting agriculture and domestic industry in Rhode Island, that there is not another State nor another Society in any State, bestows a single dollar in any direct form for the encouragement of agriculture. We must except the bounty offered on silk in Connecticut, and on wheat and corn in Maine, which, so sufficiently liberal, but are hardly to be regarded as the result of a reflecting and settled determination to encourage agriculture in the State and to lead to scientific and exact experiment with a view to the advancement of this great art. New York and some very liberal appropriation for the promotion of agriculture, which resulted in the publication of several volumes of valuable agricultural papers, which were distributed through the State. They have made likewise two or three attempts at exhibiting at Cattle Shows, and ploughing matches, but there were no premiums offered, and they became nearly obsolete. The Legislature of New York of late years, notwithstanding she has been repeatedly urged by some of her most enlightened and able citizens, has refused to do any thing, though her resources are most abundant, and agriculture must constitute her great interest.

The highest duty of every enlightened government is to encourage agricultural industry. Without agricul-

ture, commerce, manufactures, and every important interest in the community must languish. The products of agricultural industry constitute substantial wealth. In proportion as the products of the earth are multiplied the comforts of the great mass of the community are increased. It is infinitely better for a man, for his health, comfort, and morals to be compelled to resort to a good farm to his subsistence than to a mine of gold—to produce bread and potatoes by his labor, than to heap up the precious metals at his pleasure.

A hard soil, which demands much labor, a climate which calls for the constant exercise of prudence and care, and a condition of things which makes active and industry indispensable habits of life, are far more favorable to morals, to physical health and to mental vigor, and improvement, than a climate which yields spontaneously all that human subsistence requires, and a climate and condition which render all foresight and providence useless. All that seems requisite is that the climate with ordinary and reasonable precautions should be favorable to health and activity; that the soil should yield an ample compensation to well directed labor, and especially that the political arrangements of society should be such as to leave to labor the quiet and peaceful enjoyment of the fruits of honest industry.

In all these respects Massachusetts presents advantages which should attach to her most strongly the affections of her children. Notwithstanding all that has been said against her climate, the standard of health among her people is as high as in any portion of the world. Her soil, though in many parts hard and forbidding, makes every where ample returns to those who faithfully perform their duty towards it. Every step taken in the progress of our examination, more and more satisfactory as they are, we know thousands of acres of land in Massachusetts which produce two, three, and even more tons of hay to the acre. We have many an acre of land which has been redeemed at an expense of one, two and even three hundred dollars per acre, which even at the last sum, pays an interest of twelve per centum per annum clear of all expenses, and may be kept in this productive state at an expense of the crops of one year in six. We know thousands of acres of land in the State, which might be redeemed and rendered productive at an expense of thirty or fifty dollars per acre, the whole expense of whose improvement would be paid by the first or the two first years' crops, which would prove as productive as any lands in the country. Why then should we complain? ah! there is the labor—there is the labor! This is always the complaint of indolence and self-indulgence—of physical and mental imbecility. But we shall never accomplish any thing truly great, useful and valuable, until we come to the deep conviction that which costs nothing is, generally speaking, worth nothing; that persevering labor will surmount all difficulties and effect that human power can do; and that in the present condition of human nature, it is a blessing and not a curse that man is doomed to get his living by the sweat of his brow; and that when all his influences are considered, labor is the necessary foundation and source of all that is truly good in the character and condition of man.

DISTRESSING CALAMITY!

When will man be satisfied! The papers and letters from the West represent the crops of wheat as abundant as they have ever been known to be. The farmers are beginning to complain that they cannot sell their wheat but at a much reduced price. They seem to be in hopes that their corn, which promises as well as their wheat, may be cut off by the drought that is now coming on, and this may render their wheat the more saleable. Unfortunately now! How often does it seem to be necessary in the dispensations of the Divine Providence, that man's ungrateful complaints should be cured by what the poet calls the "wholesale daughters of unfeeling pain."

MONOPOLY.

It would seem from various accounts that the price of flour for a few years past, has been kept up by speculators in western New York and other places, who having the most advanced factories in the control of large banking establishments, have brought up all the wheat which they could reach by their agents, distributed over the country, and then have fixed the prices at their pleasure. This is one of the beautiful and beneficial operations of an excessive bank capital. The abundance of the crops and various other circumstances have made such changes in the price of flour, that many of these

foresters are laid flat upon their backs. They may be blamed as the government, which creates and permits the abuse of such facilities to the enriching of a few favored ones at the expense of the many, who cannot get into the sunshine. But Providence suffers no evil to come unmitigated; and renders sometimes the most severe evils productive of good. The high prices of flour for a few years past has greatly stimulated the cultivation of wheat; and abundance now floods the land.

H. C.

WOMEN MILKING.

Thirty years ago it would have been almost as difficult to find a man milking as to find a woman mowing, exceeding in cases of very large dairies. In respect matters are greatly changed; and may here, for aught we see, of getting back to the old practice, would be vain. Half of the young girls now-a-days hardly know, at least they would pretend that it would be immodest and not at all lady-like to be presumed to know, whether the milk comes from the udder or the horns. "The rosy milk-maid," the title of a song which we remember to have often heard when a boy, is an animal not known in modern rural history; and as to a young lady with thick shoes, a cloquered apron, her sleeves turned up, and a handkerchief tied over her head, though the apron should be as clean and the handkerchief as white as snow, and never so piously a pair of black eyes and ruddy cheeks peeping out from under it, it would be an idea too shocking for one of your modern exquisites even to dream of; and if presented to her abruptly, while looking in the glass in her *maquin de laines*, with her satin shoes, her gilt hair comb, her paste earrings and her insect waist, as crooked as the limb of a scrub oak, she would probably not recover from the fright for a week.

We say we have no hope of recovering the good old habits of former days. Revolutions never go back. Yet in this respect we have lost a great deal. Men are seldom neat enough in their habits to be trusted with milking. They have not the patience to wash their hands or to wash the udder before milking. They are not gentle, and often abuse the animal by their kicks and thumps. They are in a hurry in the morning to get through a business which they dislike; and they come home tired at night; the cows are necessarily milked at an unreasonable hour; and the business is very often very badly performed. Women, on the other hand, are more patient, more gentle, more faithful, more neat; and we were about to say—they ought to do the milking.—The morning air would be hating to their muscles, (if the modern girls have any muscles, for there begins to be a reasonable doubt in this matter); and the odor of the cow has been long known to be, and is often recommended by physicians as medicinal. But we will not say what we are not prepared to say, because it would be useless. It is utterly vain to attempt a contest with Fashion; for according to Franklin's proverb, "he that spits against the wind spits in his own face." We must however, be just; and in milking through Dudham last week at the close of the day, it was quite refreshing to see in at least four cow yards, woman in her appropriate sphere; and by her pleasant looks and her gentle conduct as she sat at the side of the bountiful cow, evincing her gratitude to Providence for this richest of all the benefactors which Heaven has given to man in the form of a quadruped.

H. C.

Massachusetts Horticultural Society.

EXHIBITS OF FRUITS.

Saturday, Aug. 3d, 1839.

Black Hamburg and Zinfandel Gra, ex. from Mr Otis Johnson, of Lynn; large bunches and finely colored.

Apricots, from Mr C. H. Jones, No. 14 Friend street, Boston—fine specimens.

Apricots, from Mr Randle, Boston—a fine specimen. Gooseberries, from Mr John Candler, Marblehead.—Roaring Lion and others, handsome.

Old Junceating Pear, from Mr J. L. L. F. Warren, Brighton.

Red and white Currants—fine specimens, from Mr Aaron D. Weld, Roxbury.

Early Apples, from Mr E. M. Richards, Dedham, viz.; Early Harvest, Curtis' Early Striped, William's Favorite, Sopsavine, Red Junceating and Red Astracra—a fair specimen for early fruit.

For the Committee,

B. V. FRENCH.

EXHIBITION OF FRUITS.

Saturday, August 10, 1839.

The Hon. John Welles exhibited fine specimens of the Peach Apricot, from a tree imported from France. Mr W. kindly offers to furnish buds of the same at his house in Summer street, on Saturday next.

Otis Johnson, Esq., of Lynn, exhibited fine specimens of Black Hamburg and White Muscat Grapes—the latter of superior quality.

Messrs Mason, (Charlestown vineyard,) exhibited the following variety of Raspberries: Mason Seedling, Red and White Antwerp and Barnet—the specimen of the Seedling was pronounced very superior.

E. M. Richards, Esq., of Dordham, exhibited specimens of the following kinds of Apples: Early Bough, Early Harvest, Red Astracra, Red Junetown, Curtis' Early Striped, Sops of Wine, William's Favorite, Sugar-loaf Pippin, Summer Rose, (from a scion of 1838,) Bononi, and the Calville d'Ete; the above specimens by their variety, made a very fine display, and were indeed fine for early fruit, particularly the four or five first named.

For the Committee,
JAMES L. L. F. WARREN.

Vegetables.—James L. L. F. Warren exhibited a new variety of Boiling Corn, called *Tit Bit*—very early and of superior quality.

For the Committee,
SAMUEL POND.

PARTICULAR NOTICE.

Massachusetts Horticultural Society.

THE Committee of Arrangements will meet at the Rooms of the Society, 23 Tremont Row, on Saturday next, 17th inst. at 12, M. A punctual attendance is requested. Per order,

S. WALKER, Chairman.

Boston, Aug. 10th, 1839.

NOTICE.

Our subscribers in Hartford, Conn., and vicinity, will please observe that we have appointed Dr E. W. BULL, Agent for the N. E. Farmer. JOSEPH BRECK & CO.

August 7.

BRIGHTON MARKET.—MONDAY, August 12, 1839.

Reported for the New England Farmer.

At Market, 210 Beef Cattle, 20 Cows and Calves, 1500 Sheep, and 200 Swine.

PRICES.—*Beef Cattle.*—Last week's prices were fully sustained and on some qualities rather higher prices were obtained. We quote First quality, \$8 50 a \$8 75. Second quality, \$7 75 a \$8 25. Third quality, \$7 00 a \$7 50.

Cows and Calves.—A large number were sold. We notice \$28, \$35, \$42, \$45 \$55, and \$60.

Sheep.—Sales quick. Lots were taken for \$2 25, \$2 50, \$2 75, \$3 00, and \$3 20.

Swine.—A lot of old hogs, mostly barrows, were sold for 6c. A lot of fleshy shoats to kill at 7. No lots were sold to peddle. A few shoats were retained from 7 to 9.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending August 11.

STRAWBERRIES.

Those who are desirous of having this delicious fruit are respectfully informed that the subscriber has succeeded, after a number of years experimenting upon the *Strawberry*, not only in obtaining *var. carolinis*, but in ascertaining the best method of cultivation.

Specimens of the fruit grown in his Garden have been exhibited at the *Massachusetts Horticultural Society's Room*, the *four past years*, and are also too well known in *Fairbank Hall*, to need a particular notice here.

He has for sale at his Garden in *Brighton, Mass.*, the following *eight varieties of Plants*. They are of superior stock and quality, all warranted to be truly named, and free from the mixtures often found in those offered for sale indiscriminously.

Those who are in want of *Strawberry Plants*, are respectfully invited, and they will find in *specimens*, in call at the *Garden* and see the manner of cultivation. The method of cultivation, and any information desired will be cheerfully given.

The subscriber would state that from many years *personal experience* he is satisfied that plantations of these vines made the last of July or early in August, by careful and constant attention will produce nearly or quite as much fruit the season following as these plantations made in the Spring will produce the second year.

Warren's Seedling—A new and valuable kind. A free bearer, fruit very large and juicy; fruit measuring four and a half inches have been exhibited the present season.

Mythen Castle—Fruit extremely large, high flavored, and sweet. Specimens of this kind have been exhibited at the Horticultural Rooms for two years past, measuring five and a half inches in circumference.

Bath Scarlet—Fruit large, full bearer, and beautiful scarlet.

Early Virginia—This is considered the earliest fruit—a free bearer, hardy, and very early; decidedly a fine kind for market.

Engel Scarlet—Fruit long oval shaped and juicy.

Hatfield—Fruit smaller but very numerous.

English Hood—Fruit well known.

Monthly—Fruit is gathered from the vines from June to October, and in good quantity and fine quality.

Orders left at the Garden, or directed to the subscriber, *Brighton, Mass.*, or left at Messrs J. Breck & Co's Agricultural Warehouse, Boston, will be carefully and promptly attended to, and all Plants will be carefully packed and forwarded agreeably to directions.

JAMES L. L. F. WARREN.

Nonantum Vale, Brighton, Mass. July 17. 1839

New York Urat and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are *not divided* among the Stockholders, as are those belonging to another establishment, but sold, to applicants, for cash on delivery. Orders are supplied in the order of time in which they are received. Urat 50 cents and Poudrette 40 cents per bushel, with contingent charges for bags or barrels, &c.

The company are daily preparing for use, during the warm, dry weather, the materials collected during the past winter, and will have several thousand bushels ready before the end of October next. The material is disjuncted and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1838 and 1839, on Long Island, has satisfied many of the farmers that these manures have the *quickest* operation upon vegetable matter, producing *greater abundance*, and the *cheapest* of any manure they have ever tried.

Amended instructions for their use, the result of practical experience, will be furnished on application. The effect of *Poudrette* upon *Grape Vines* and *Morus Mutilaulis* is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manures, and farmers and gardeners may confidently rely on a supply.

CULTURE OF THE MIND.

Mind makes the man—
Want of it the fellow.

This motto, somewhat altered from Pope, has a peculiar bearing upon the agriculturist. The farmer possesses all the privileges, and most of the advantages, of other classes of the community; and if he will improve his mind, his influence will be as potent, and his example as salutary, as the influence and example of any other profession. The richest natural soil will produce neither bread nor meat without culture. The highest natural natural gifts of intellect will not profit the possessor, unless, like the rich soil, they are cultivated with assiduity and care. Good culture not only improves the mind, and fits it for high mental gratification and enjoyment, but it lightens the toils, and greatly increases the profits of labor. Franklin owed his fame, his fortune, and his usefulness, to his early habits of study, of industry, and of virtue. Without these early habits, he probably would have risen to neither fame nor fortune. Some minds, like some soils, are naturally richer than others; yet even apparently sterile minds, like infertile soils, may, by good culture, be made to yield great returns. Let the young farmer, then, aspire to the highest honors of the nation, by endeavoring to improve his intellectual faculties; and if he does not attain the goal of his wishes, he may be sure of greatly improving his condition and of benefiting others, provided always, that he is industrious and honest. However menial and servile agricultural labor may have been considered among the privileged classes of Europe; and however degrading it may yet be held by the would-be aristocracy of America, it has commanded the highest respects of good men in every age, and constituted in our country, the favorite study and employment of a Washington, a Jefferson, a Madison, a Monroe, and a Jackson; of an Humprey, a Livingston, a Shelby, an Armstrong, a Lowell, a Lincoln, and a great many others, whose names will stand out in bold relief upon the future annals of our country. Let, then, no young aspirant for fame and usefulness, shun rural employment, because it does not feed his hopes of distinction, and let no one, engaged in this employment, forego the opportunity, which his condition presents, of cultivating his mind, as the surest means of sinking the fellow, and rising to the dignity of the man.

THE ADVANTAGES OF OFFICE.—The following letter might have been written by a young man in Arkansas to his mother in New Hampshire, and might not—we do not endorse it. It seems that the young Yankee had lately received the appointment of post-master in that State, and that he presumes a good deal upon the strength of it.—*See Orleans Gazette.*

WILDCATSVILLE, RATTLESNAKE CO. Ark.
Dear Marm:—You haint the least idea in the world how I'm a gitting along out here in this Rackansack country. They've lately appinted me post-master in this town, and I'm expectin to get the office of justice of the peace afore long. I've had three cases left out to me already. One on 'em was where a feller had gouged out another chap's left eye, and neither on 'em was sartin shure whether he was at the top or bottom when

the thing was done. I knew all about it just as easy, 'cause I was watchin all the time—so I decided the case accordin.

This is a great country! Why, marna, the corn here grows as high as witch hazels, or cherry trees, and the cotton and other fruit beats all calculation.

I'm makin' my eternal fortin here just as fast as I can. I can do any thing a little smarter than any of 'em, 'ceptin playing cards, but I du think they rather go ahead of me at playin lu and poker, 'cause they almost always win my money.

You know them shirts you said you'd made for me and didn't know how to ferrid on; you can send 'em by mail now, as I don't have any postage to pay in consequence of the virtue of my office. If the watermelons are ripe I wish you would send on tu or three; also, them tu pair of mankeen (trousers I hadn't room for in my trunk when I started. You'll find a button off on one pair unless you've sow'd it on since I left, and while you are about it you might as well let out that gather in the bottom of 'em—I expect I've grow'd a little since I left hum. Send 'em all by mail—they wont cost me the first red cent.

I've now been here nearly nine months and my health has been first rate nearly all the time. The only sickness I've had worth a mention has been the bilious fever twict, the congestive fever onc't, the fever and ager occasionally, and the dumb ager all the time.

Marna, I wish you give my luv to Eunice Homes, and ask her if she recollects that time we went to Hepsy Stearn's quilting? I wish Eunice was out here now. If you see Zack Stearns toll him he may keep that knife I cum away and forgot, as one blade was broke out and it aint of no great account.

I feel as tho' I had a shake a comin on so I must stop writin. Dont forgit the shirts and trousers. Your luvun son,

EBEN PETTINGILL.

N. B. Apples is quite scarce out here. I would ask you to send on a barrel by post, only I'm afraid they'll lumber up the mail. You can send a peck any how.

SPEAK ILL OF NO ONE WITHOUT A JUST CAUSE.

There are many people in the world who are in the habit of speaking lightly or contemptuously of their neighbors, and some who do not scruple to treat those who are absent with the greatest disrespect, by showing up their faults to those who are present, without ever alluding to any good qualities they possess. There is nothing so detestable as this habit of backbiting in society; it often produces the greatest bitterness of feelings between those who ought to live in peace and good fellowship towards each other, and it never does any good. It generally arises from a selfish feeling, but sometimes from thoughtlessness; in either case it is injurious to society, and ought to be condemned by every well meaning and sensible person. Selfish persons have generally such an over-appreciation of themselves, and the situation they hold in society, that they are apt to speak of others with contempt, and are never so happy as when they discover the least fault, (however trivial it may be), in some of their neighbors or acquaintances. Instead of which, it would be well for them to examine their own conduct, to see whether they were without fault, and ask themselves whether they would like any fault or foible they

might be guilty of to be made the subject of conversation amongst their neighbors. It would be better if they were to consider the noble destiny which all mankind partake off in common with themselves, both as respects the great moral ends of this life, and the more sublime prospects of the future, if they would remember the great fellowship of our common humanity—the social end—which (as parts of a great community) we are all working to attain, and which awaits us at the close of our brief existence. Let them reflect on these things, and not offend their Creator by injuring their fellow creatures—rather let them judge others with tenderness, as they would wish to be judged, putting aside the weeds that cover the surface of the characters of their neighbors, to ascertain the depth and sweetness of the clear water beneath it.—*New York Sun.*

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street. July 10.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

N. E. FARMER.

NOTICES OF FARMERS—MINUTES BY THE WAY, &c.

Having had occasion to make excursions in the country for some weeks past in various directions, and having invitations to visit many flourishing farms in the neighborhood of Boston, we shall endeavor to present to our readers from week to week the various improvements which have already fallen under our notice in the different places we have visited, or may have occasion to visit for a month or two to come, hoping that we may be enabled thereby to stimulate and encourage others, who have improvements begun or contemplated. We have seen the products of the farm increased ten fold, by pursuing a well digested system of husbandry for a few years only, which, if generally adopted, would add millions to the annual income of the agricultural productions of our Commonwealth.

Visit to the Farm of Elias Phinney, Esq., Lexington, Mass.

We have in the farm of this gentleman substantial proof of the efficacy of "book farming." He assured us that his interest in agriculture was first awakened by reading the N. E. Farmer. Having received a classical education, he has to be sure, the advantage of our farmers in general, for whom so little has been done by education.—we were prepared, therefore, in viewing his premises, to witness something a little extra, from what may be seen on well cultivated farms in general: but we found that our expectations had not been raised sufficiently high: we were in fact delighted and astonished to be made acquainted with the wonderful improvements which have been effected on this place since he began to cultivate it fourteen or fifteen years since. It was then a poor worn out farm, covered with rocks, whortleberry bushes, and scrub oaks; while the lowlands were inaccessible quagmires and alder swamps of the most unpromising description—the whole farm, consisting of 160 acres, not affording more than 8 or 10 tons of hay, and all other crops in the same proportion,—the fences out of repair; the fruit of an inferior quality, fit only for cider; and every thing upon the place at sixes and sevens, as the saying is. It does not seem hardly possible that so much could

be done on a farm of this size, and in so short a time, but the institutions and hills of New England, make an effort and bring them into subjection: it will prove an antidote to the western fever, or we are much mistaken.

4th. In his orchard of apple trees, which for beauty, thrift, and produce can hardly be excelled.

5th. In his choice collection of fruits of every desirable variety.

6th. In his improved breed of swine.

7th. His barns and accommodations for cattle, swine, poultry, &c.

To which may be added many other improvements of minor importance, but which add to the interest, beauty, and profit of the place.

The idea of planting upon the green sward without disturbing the sod, has been ridiculed by a writer in the N. E. Farmer, vol. 17, page 317—as being impracticable especially in the potato crop.—We saw an example of this operation, and one too of a most perfect kind, which we should suppose sufficient to convince the most sceptical. It was in a lot of three acres of potatoes. On the 20th of June there was a heavy crop of grass upon the ground, in addition to which twenty loads of compost to the acre was spread on, and at that time turned over; after ploughing, it was rolled with a heavy roller, (an implement by the way which should be in the possession of every one who calls himself a farmer.) The potatoes were planted in drills—had been hoed but once; yet hardly a weed was to be seen, nor a spear of grass daring to show itself, and sufficient earth, about the plants, with every prospect of an abundant harvest. In the spring this ground will be in fine order to lay down again to grass, and that too without disturbing the sod; or if advisable, planted with corn or any other crop.

Allowing the vegetable matter turned in equal to 20 loads of compost per acre, we have with that spread what is equivalent to 40 loads per acre. No wonder then that by following this process continually, he should be able to cut from 2 1-2 to 3 1-2 tons of hay per acre, which he actually does from his grass lands. He has another idea which we think important for a good crop of grass; that is, to sow an abundance of seed. His rule is 20 lbs. of clover seed per acre, together with a liberal allowance of herds grass and red top to boot. This would astonish most of our farmers, who can afford only from 4 to 10 lbs. per acre.

We saw a field of six acres of corn, from which

the institutions and hills of New England, make an effort and bring them into subjection: it will prove an antidote to the western fever, or we are much mistaken.

We noticed a fine field of wheat of 8 acres, which the laborers were gathering into the granary. It appeared well filled out: the produce estimated at 20 bushels per acre: it was of the variety called the Black Sea, which we find succeeds best in the vicinity of Boston and most generally cultivated. We were informed that about 30 acres were under the plough the present season. Besides Indian corn, potatoes and English grain, Mr Phinney cultivates the root crop extensively. His ruta bagas, mangel wurtzels, sugar beets and carrots looked very promising, and will afford an abundance of food for his numerous family of swine, and other stock.

In draining his low lands, Mr Phinney first cuts off all springs from the surrounding hills by a deep cut at the margin or outer edge of the piece, which is converted into a blind ditch: from this most important cut, the drains are made to the centre ditch. Where there is an abundance of stones as in this case, all the drains may be filled and covered over, so that the operations of the plough, &c., may not be impeded. We were shown one piece over which it was dangerous for his cattle to pass, and in which they sometimes got mired, before he commenced the draining process; here his first essay on draining had been made, in which, through inexperience, he cut only the centre and cross drains, but with all he did, it would produce nothing but skunk's cabbage, hellebore, brakes, &c., and it seemed that all his labor had been lost, until he learned the importance of the ditch around the margin, which produced the desired effect, and now it ranks among his most productive grass lots, and a loaded team may be driven without difficulty over it.

We were pleased with his system of digging peat, of which he has an ample supply. Where peat is generally dug, the grounds are left in the roughest state, and present an unpleasant and unsightly appearance, and remain an unproductive waste: but it is his rule to have the top spit, a depth of ten inches or a foot, (the portion unfit for the fire,) thrown over and leveled as the work of digging proceeds: in this way it soon becomes

be a ton of them. All the other walls are double, from 5 to 10 feet thick and 5 to 6 feet high, and must have consumed an enormous quantity of stone. We noticed grapes upon many other portions of wall.

(To be continued.)

For the N. E. Farmer.

BET SUGAR MANUFACTURE.

Boston, Aug. 8, 1830.

MR EDITOR: Permit me to offer through the medium of your excellent paper, a few remarks on a subject that seems at present to engross the attention of farmers, and must at no distant day affect materially their interest.—I refer to the manufacturing of sugar from beets. I am aware I cannot suggest any thing new, for much has been said already to impress the importance of raising the beet and demonstrate the practicability of its conversion into sugar. There seem to be a few facts connected with it on which all agree, viz.: first, that beets do not all contain the same quantity of saccharine matter in a given weight, owing to the quality of the soil on which they are raised, the kind of manure used, and the mode of applying it: therefore in accordance with these principles, when the extraction of sugar is contemplated, farmers should not endeavor to raise very large beets,—they should not use very rotten manure, and whatever manure is applied should be given to the crop preceding that of beets. I believe a compost of peat or muck and lime, or ashes is among the best of manures for that crop. Second, that beets rank among the first vegetables as food for cattle. Third, that it is a most sure and abundant crop. Fourth, that the cultivation of beets tends greatly to ameliorate the soil. Fifth, that even when sugar has been made from them, they afford a vast quantity of good fodder as well as manure, (accounted the best for that crop.) With all these advantages to recommend the sugar beet, it is gratifying to see that farmers have begun somewhat extensively the cultivation of it, without perhaps any regard to the making of sugar; but as it can be made (in my humble opinion) more profitably on a farm than elsewhere, and as it is emphatically a farming produce, it is on this topic that I would call attention.

Where a small quantity of sugar is wanted, the cost of perfected apparatus seems to preclude the possibility of making it. But small farmers should not give it up;—they may use their cider mill or grater to grind the beets—their cider press to extract the juice, and if they have not a sufficient number of tubs or pans to receive it, casks or barrels sawed in two will be found as convenient. Perhaps they will need a kettle larger than they possess, but if it cost a few dollars they may use it for other purposes after the sugar is made, and their cattle will fare none the worse for having cooked food. They can every day work up just the quantity required to feed their stock, so as to have no loss, and if by these simple means they do not extract all the sugar, it is not lost, for it will go to their cows.

Where a large quantity of sugar is expected, I shall suppose of course, that the farmer who undertakes it is wealthy; therefore if he is already provided with a steam apparatus for steaming the food of his cattle, let him apply it to sugar pans or kettles of proper size, dispose every thing so as to save time have efficient graters and press, dispose of the pulp, as fast as made, except if it is pressed with a hydraulic press, for then he can keep it considerable

time by excluding the air from it, or he can dry it, for the time is not distant when it will sell at \$20 a ton for paper making. Farmers seldom will devote to it more than the winter months; but those who wish to manufacture in the spring or summer, can do it by connecting the dry and fresh process. I mean that while they are manufacturing from fresh beets, they should slice and dry all they can. Most any kiln will answer. With proper care, that method of drying the beet will afford to farmers in general a profitable way to dispose of their beets when manufactories will be in operation about the country. Dried beets can be sent in packages like dried apples. If cattle at first refuse to eat the puff, the addition of a small quantity of meal and molasses (beet) or molasses alone will make it relishing, thus giving a way to turn molasses to better advantage than by distilling. I should here state my reason for preferring to operate on green beets instead of dried ones: it is because the mode is easier, cheaper and quicker—it produces about as much, every thing considered, and sugar of a fair quality is regularly obtained without being subject to mishaps that oftentimes affect dried beets. The pulp is preferred by cattle. These assertions I am aware come in direct contradiction of the theory so earnestly advocated by well informed and well disposed people, but as yet nobody in this country, even the most sanguine, whether for public or private interest, has proved, practically, the superiority of any recent improvement. All the new methods seem to have obtained favor from their apparent facility and great return in sugar, and no doubt the patriotic efforts of many a philanthropist instead of advancing the cause as intended, in endeavoring to secure to farmers the best of European inventions, have only occasioned the neglect of well known processes by which hundreds of factories have thrived to this day.

I do not wish it to be understood that I am opposed to improvements—far from it. I think every body who makes any sugar should, as far as practicable, give a fair trial to all those valuable discoveries, no matter how extravagant. Most invariably those experiments will lead a close observer to something applicable to his own interest. But first, I do not think it right for us to remain passive admirers of the success of our transatlantic friends, without trying to share their profits, in the hope that new inventions giving double profits are actually made or in progress. Second, I am supported in what I advance by a conviction founded on some experience, that good sugar can be easily and regularly obtained from fresh beets when proper manipulations are used, and that by the dried process, the solution of saccharine matter from the beet is far from being obtained except a gun or nuchilage that seems to prevent the easy extraction of the sugar, and it requires for either process the use of the same chemical agent. Now farmers should not be frightened by those technical words, which sound, it is true, as if a chemical education could not be dispensed with. But every farmer possessed of a sound head, knows enough already to make sugar. It is a simple, very simple operation—about as chemical as the making of butter or cheese, and as certain in its results, in spite of all that has been said of operations that did not succeed, or of the difficulty of extracting sugar from some particular beets.

I am, with respect, sir,

Your very humble serv't,

M. DUROY.

From the Albany Cultivator.

ON THE APPLICATION OF MANURES.

Fredericksburg, Va., June 18th, 1830.

J. REEL.—DEAR SIR—In your paper for the present month, I have read the following intimation: "A subscriber wishes Mr Garnet's opinion of the best method of applying manures to land"—and presuming that I am the person meant, I avail myself of the earliest opportunity to evince my willingness to gratify him. But as no man's mere opinion on such subjects is worth any thing without the facts and reasons upon which it is founded, I shall take it for granted that he desires to hear both, and will therefore state them together.

Whether your subscriber means by the term "manures," all things commonly so called, or only putrescent substances, I have had but one opinion for a long time in regard to their application, and this has been confirmed by all my subsequent experience, each year adding something to the great mass of consentaneous facts. When my attention was first turned to this subject, some thirtyfive or forty years ago, I had adopted, but without examination, the notion then most common amongst us, that it was best to let all putrescent manures be well rotted first, and next, to bury them deep, either by the plough, spade, or hoe. This notion, like the common law, was so old that "the memory of man extended not to the contrary;" but happily for us all, the revolution had broken the entail of opinions as well as of landed estates, and left us at liberty to think and act for ourselves. The natural consequence of this increased freedom was, the introduction of many new practices in the arts, as well as in government; and agriculture came it for some small share of these benefits. Among them was the application of putrescent manures to the surface, and in a much less fermented state than had ever been tried before. But so dreadfully afraid were the first experimenters of the formidable laugh of that once numerous family, "the Goodenongis," that they made their trials as it were, by stealth; and consequently the results remained for a long time unknown, except to a few I happened to be among the number, and could not long resist the evidence of my senses, although most confess, that at first, it seemed to me a sort of sacrilege, even to doubt, and still more to act, in direct opposition to an opinion which, for ought I know, had descended from Triptolemus himself. By degrees, however, my courage waxed stronger and stronger every year, until I felt myself brave enough to commence the following experiment which several old farmers in whose veracity I perfectly confided, had assured me they had often tried and always with the same result as that which am about to report in my own case.

I began penning my cattle late in the spring, and continued it until frost, in pens of the same size moved at regular intervals of time, and containing the same number of cattle during the whole period. These pens were alternately ploughed, and left unploughed, until the following spring, when all were planted in corn, immediately followed by wheat.—The superiority of both crops on all the pens which had remained unploughed for so many months after the cattle had manured them, was just as distinctly marked as if the dividing fences had continued standing: it was too plain to admit even of the slightest doubt. A near neighbor, a young farmer, had made the same experiment on a somewhat different soil, the year before, but with results pre-

cisely the same. Similar trials I myself have made and seen made by others with dry straw, alternately ploughed in as soon as spread, and left on the surface until the next spring. In every case the last method proved best, as far as the following crop would prove it. The same experiment has been made by myself and others of my acquaintance, with manure from the horse stables and winter farm pens, consisting of much unrotted corn of fall: and without a solitary exception, either seen by me, or heard of, the surface application, after the corn was planted, produced most manifestly, the best crop. Upon these numerous, concurrent, and undeniable facts my opinion has been founded, that it is *best to apply manure on the surface of land*: and "I guess," (as brother Jonathan would say,) that it is not likely to change, unless indeed, I should hear a still greater number, equally well authenticated, on the opposite side; although I must say, that up to the present time, I have not heard a solitary one. True it is, that I have read many ingenious, fine spun arguments in opposition to the opinion which I hold in common with numerous other agriculturists, but no proofs whatever have accompanied them, and therefore I must remain an infidel, until they are sustained and corroborated, by such facts as should always be deemed indispensable to establish any practice whatever, in any of the various branches of husbandry.—To collect these facts is a slow and most tedious process, not very flattering to that pride of opinion which delights in speculative theories of our own elucidaion, and sickens at the mere thought of the labor necessary to make, to watch, and to record accurate experiments in agriculture. In no other way, I think, can we account for those differences of opinion as to matters of practice, which are often found among our brethren, where all the facts are on one side. But to refuse to believe in that which we cannot explain, unless in some way that tickles our own vanity, gave rise to the sect of sceptic philosophers, and it is to be feared, will keep up the breed as long as the world stands. Let me not be here misunderstood. Far be it from me to object to theory and speculation, provided the sole object in concocting and maintaining them be to arrive at truth. As this should be the aim of all, I am in favor of the utmost latitude of discussion in the honest pursuit of it. But I do, and will forever protest against that practice which is far too common amongst us, of regarding plausible and apparently scientific conjectures so much more than the actual results of experiments fairly and accurately made, as not unfrequently to indulge our fancies with the former, even in direct opposition to the latter. Take, for example, the two conflicting creeds

ses I have stated, although I have never seen nor heard of their doing it in any. The effects however, which *really have taken place*, (facts though they undeniably are,) happen to contradict, as plainly as we see the nose on a man's face, certain preconceived fictions, or ingenious theories, if you please to call them so—quoad manures—in the propagation of which much paper and ink has already been consumed, much head-work is still employed; and what is to be done? Shall all this labor, all the ponderous volumes elaborated by it, all the cogitations in support of those theories, which are now taking the rounds in our agricultural papers—shall all be discarded as things serving only to show how much fonder men are of their own speculations, than of facts the occurrence of which brings them no credit for remarkable talents? Or, shall we still cling to these theories, maugre the facts, merely because we have already shed so much ink, and spent so much time in laborious efforts to sustain them? I can answer only for myself by saying, that I will ever abide by facts in preference even to my own opinion, whenever they conflict with each other. But in regard to the subject now under consideration, I believe there is a perfect accordance between them. Your subscriber, however, may possibly think that I have "jumped too speedily to my conclusions:" I will therefore, respectfully offer to him such explanation of the operation of surface spread manures, as has been satisfactory, at least to myself. Should it prove so to him, I shall have gained my object in complying with his request.

[Concluded next week.]

Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, Aug. 10, 1839.

We were not present at the exhibition to-day; but from a memorandum made, and kindly handed to us, by our attentive Corresponding Secretary, Robert Treat Paine, Esq. we are enabled to make the following report.

Two splendid specimens of *Nerium splendens*, from Mr Warren of Brighton.

A beautiful specimen of *Echinocactus Erysiis*, and a bouquet from the garden of S. Sweetser, Esq. of Cambridgeport.

By Thomas Lee, Esq., of Brookline, Roses, Dahlias, and other flowers,

Col. M. P. Wilder, of Hawthorn Grove, Dorchester, fine specimens of the following Dahlias, viz. Marquis of Lothian, *Striata formosissima*, Sudbury Hero, A. A. Broadwood, and Reliance.

Balsams, Carnations, Picotees and other pretty things, from Mr S. R. Johnson.

Reporters from Messrs J. Hovey and S. Walker

Wilder, Messrs Carter, Warren, Mason, Howe and Walker. Bouquets from Messrs Carter and Walker.

There were two specimens on our tables which we consider as very beautiful, viz. a seedling *Phlox (alba)*, by Mr Carter of Cambridge. We hazard our opinion, and our taste, when we say it is the best of all the numerous, and we had almost said the numberless varieties of the *Phlox*. The other a fine specimen of *Dahlia*, var. *Striata formosissima*, by M. P. Wilder, Esq. This carnation striped flower has exceeded our expectations, and has opened to our mental vision a new field; we now look forward with hope that we may yet see this gorgeous flower with a *pure white ground striped with scarlet or crimson*. From our knowledge of parti-colored flowers, as also from report, we were led to suppose that this variety would sport very much, but the specimens exhibited by Col. Wilder, on the 3d, 10th, and this day, have been very uniform and very beautiful.

Native flowers by Wm Oakes, Esq.—*Liatris scariosa*, *Apios tuberosa*, *Gerardia glauca*, *Rudbeckia laciniata*, *Spirea alba*, var. with rose colored flowers, *Solidago canadensis*, *Eupatorium pubescens*, *Cinna arundinacea*, *Aster acuminatus*, *A. solidaginoides*, *A. coryzoides*, *Solidago flexicaulis*, *Scutellaria lateriflora*, *Apocynum* and *rosæmifolium*, *Actæa alba*, var. fruit with slender pedicels, *Viburnum dentatum* in fruit, *Coxeus alternifolia* in fruit.

Native plants by E. Weston jun. Esq. and F. Parker.—*Scutellaria lateriflora*, *Glycine apios*, *Linum Virginiana*, *Clematis Virginiana*, *Trenauthes alba*, *Solidago lavigata*, *Gerardia maritima*, *Hypocyrus Virginica*, *Liatris scariosa*, *Eupatorium verticillatum*, *Gerardia glauca*, *Hedysarum Canadense* in flower and fruit, *Gerardia pedicularis*, *Monarda allophylla*, *Vernonia novaborcensis*.

EXHIBITION OF FRUITS.

Saturday, August 17, 1839.

Mr J. Deane, of Mansfield, exhibited three varieties of Apples (not named), very fair for early kinds. Also, very fine looking Peaches grown in open air.

B. V. French, Esq. of Braintree, exhibited Apples: Early Harvest, River Apple, Sopsavine, and Kentish Filbasket—the latter a very choice fruit, and worthy cultivation.

From Otis Johnson, Esq. Lynn, superb specimens of Black Hamburg Grapes, weighing 2 lbs. and upwards.

Messrs Mason, Charlestown Vineyard, exhibited fine clusters *Sweet Water Grapes*.

Aaron D. Williams, Esq. Roxbury, exhibited a basket of "*The Williams Apple*," pleasant to look upon, and sweeter to the taste! This apple should be cultivated by those who like fine fruit.

BEES.

MR TUCKER—I procured me a hive of bees last spring, and a few days since they swarmed for the first time. It was a large fine swarm, was hived readily in a new hive, and went to work apparently good natured and in earnest. The next day, however, they came out of the hive and went off into the woods. No one saw them until they were fairly under way, and it seemed uncertain whether they came from the new or the old hive, as they were standing close together, and no difference in the numbers or labors of either swarm could be discovered. The activity at the new hive continued till near night, when it suddenly ceased, and at night, the hive was found empty of bees, a few small pieces of comb being left as the result of their labors. Now I should like to know from some of your subscribers who have had experience with the honey bee, whether the bees select their tree in the forest before swarming;—the best method of preparing the hive and hiving the swarm—and whether a swarm, intent on leaving for the woods, can be prevented, and in what way. It appeared to me that the bees absent from the hive at the time the swarm left, were unacquainted with the movement; but on returning with the honey they had collected, immediately left for the new residence in the woods. This would account for the general activity about the hive until the absent bees had returned, and again departed in train of the decamped colony. If so, there must have been a general knowledge respecting the new location; and to that point all directed their course, so soon as it was discovered that the main body with the sovereign, had left.

A. B. GINNEB.

From the Cincinnati Gazette.

STRAWBERRIES.

The following communication came to us yesterday through the Post Office. It has reached us in thirteen days and after the strawberry season is over; but still it may be of interest to those cultivating the delicious fruit. The communication probably remained in the writer's pocket until yesterday.

Cincinnati, June 27, 1839.

MR HAMMOND: In your paper of this morning, you give an extract from the New York Journal of Commerce, by which it appears that a person in the vicinity of that city, "the present season, sold \$210 worth of strawberries, from one acre of ground."—Mrs Arbigust, for several years, from strawberries, made at the rate of \$1000 per acre, from her garden in the vicinity of this city. She raised the variety called the Hudson, and they measured from 2 to 5 inches in circumference. For many years she was the only person in the vicinity, aware of the fact, that in this and most other varieties of the strawberry, there are two classes of plants—the one defective in the male and the other in the female organs; and that an acre of either kind, separate, would not produce a perfect fruit. In running, the barren, or male vine, forms ten new plants, where the female forms one, and the latter soon disappear. She is the only person, with the exception of her children, that I have ever met with who can tell the male from the female when out of blossom. When in blossom, they can be distinguished at the distance of 20 feet. This subject is, even now,

but partially understood; and with the care used by Mrs Arbigust, in the vicinity of New York, an equal yield may be obtained.

N. LONGWORTH.

What in Hauswifery.—In summer and autumn your soap grease is apt to accumulate beyond your immediate wants; if put it away it is apt to be devoured by maggots, and if made into soap, you may not have pine or other vessels enough to hold it.—Having suffered loss from being placed in such circumstances, we were much gratified with a piece of intelligence accidentally received, which relieved us from the disagreeable dilemma. By the boiling your soap with salt, about a quart of the latter to three gallons of the former, you can separate lye and water enough to make the soap hard. After boiling half an hour, turn it out into a tub to cool. Cut the cake which swims on the top into pieces, and having scraped off froth and other impurities, melt again, (without the lye and water underneath, of course,) and pour into a box to cool. You may then cut it up into bars of proper dimensions for drying. By adding a proportion of rosin, well pulverized, at the last boiling, you will have yellow soap like that made for market.

Families moving to the "far west" or elsewhere, would find it more advantageous to make their soap fit for carriage in this way, than to give it away or sell it for next to nothing.—*Farmer's Mo. Visitor.*

OXEN vs. HORSES.

MR TUCKER.—There are different opinions among the farmers in this vicinity, respecting the expense of keeping a yoke of oxen, and a span of horses. Having used oxen from my youth up to the present time, I know pretty well what the expense is of keeping them during one year. A yoke of oxen will not perform more than half the labor that a good team of horses will, and the expense of keeping a span of horses is but a trifle more than that of keeping oxen. No team can labor without being pretty well taken care of. I will admit horses cost something more than oxen, but a team of good horses will perform enough more in the course of a year to pay for all the difference that there would probably be in keeping.

If a farmer has nothing but an ox team to put in his spring crop; and it should be excessively warm, (which it very often is in the spring,) it would be very late before he would get his seeds into the ground. Farmers who are obliged to have hired labor through the summer season, would do much better to have horses for their teams than oxen; that is, if they desired to get the worth of the money they have to pay for the labor of their hired men.—In a hot summer's day, if a man were sent into the field for the purpose of ploughing with an ox team, I would warrant you the man would do but very little.

Oxen are very good in their places; for instance, take a yoke of oxen into a new fallow (for the purpose of drawing logs,) and they are far better than horses; and there are many other kinds of work on a farm for which oxen are preferable to horses—for ploughing, by all means give me a good span of horses. No farmer ought to be without oxen upon his farm, but in my opinion they never ought to be put into a plough, when horses are so much better. For repairing fences, carting manure, stone, rails, &c., oxen are preferable to horses; but they are poor

animals for the farmer, in any other employment on his farm. Whether any of my brother farmers will agree to the above I know not. If any should not, I hope they will express their opinion through the columns of the Genesee Farmer.—*Genesee Farmer.*

A good Cow, good Butter, and a good deal of it.

MR EDITOR: As a good deal has been said relative to the quantity of butter exhibited some short time since, by Mr Kenworthy, made from one week's milking of a single cow, I was curious to ascertain the facts, as well with regard to her keep as the produce. I accordingly inquired in the proper quarter, and was informed that the cow Filton, now about seven years old, was purchased of John Zane, of this county, with her dam, both for thirtyeight dollars. Filton, at the time of her purchase, was four months old. This is all the information I have been able to obtain. Mr Kenworthy informed me that her keep was as follows: a small quantity of hay in the morning, then a mess of bran, while eating which she was milked; then about half a peck of grains, well mixed with a suitable portion of cut stuff, with the addition of a little salt. She was then well curried, then watered, and especial care taken that she did not drink too much. If the weather was favorable, she was permitted to run in the barn yard, if not, she was stabled again, and fed with hay only. At noon and night she was treated in the same way, as above described, in every particular, except that the grains were omitted at noon. Milked morning and evening, the quantity of milk varying from twentytwo to twentyeight quarts per day. The following is the produce of butter from the two weeks' milking:

First week's butter	18 lbs.
Second week's	16 1-2

34 1-2

Three pans of milk, belonging to the second week's milking, were frozen, and thereby lost.—The butter was very beautiful to appearance, and of a very superior quality, and we hope that many of our fair country-women will follow the example of Mrs Kenworthy, who deserves no little credit for her care and attention to the duties of her dairy.—*Farmer's Cabinet.*

Memoranda for young silk culturists.—Let silk cultivators bear in mind that the careful and attentive manager of silk worms, will make his worms spin cocoons in four weeks; eight pounds of his cocoons will make a pound of raw silk, and a pound and a quarter of his raw silk will make a pound of finished sewing or other silk. The careless manager will require at least six weeks before his worms spin their cocoons—ten pounds at least of his cocoons will be required to make a pound of raw silk, and at least a pound and six ounces of his raw silk will be required to make a pound of finished sewing silk. Let the rules of arithmetic be applied to find how well the silk business will pay for care and attention.—*Jour. of the Amer. Silk Society.*

Growth of a drove of pigs.—Col. Merritt, of Jay, informs us that he purchased a drove of pigs or young shoots in Brighton last fall, and drove them up east into Maine. He was four weeks upon the way, and part of the time was stormy and bad travelling. He kept them upon corn and water, and they gained 2000 lbs. weight. This was probably growth rather than fat, but at 6 cts. per lb. would pay nearly or all the expenses.—*Maine Farmer.*

From the Farmer's Monthly Visitor.

—
Warner, June 3, 1839.

MR HILL:—A friend at Montreal sent me the "Morning Courier" of April 19, containing a communication on the Wheat Fly. The reasonings of the writer, Mr Harwood, I think are fully sustained by facts and observations in this vicinity. I forward you the article: perhaps you may think it of sufficient interest to republish it.

Yours, &c.

L. BARTLETT.

THE WHEAT FLY.

To the Editor of the Morning Courier:

Sir,—I have just seen, in your paper of the 1st instant, a letter from Mr Papineau on the subject of the Wheat Fly, wherein he recommends the application of a solution of blue vitriol to the seed wheat, as certain in its effects to protect the grain from the ravages of the wheat fly.

Lower Canada has, for several years past, been sadly afflicted by this fly, and the knowledge of any means to destroy its destructive effects is very important.

For my own part, I have no faith in the means recommended in Mr Papineau's letter. The instance he mentions of Mr Cuillard's success, was, I think, purely accidental, as such instances are no way uncommon, even in parts of the country where the fly has been most destructive.

The wheat fly, there can be no doubt, is propagated by depositing its eggs on the young ear of wheat; which egg in a few days produces the grub; that, by feeding on the milk of the wheat, robs the farmer of his crop; this grub afterwards is changed to a chrysalis, in which state it remains until the next mid-summer heat, when it emerges into the fly state.

If this is true, it is evident that the remedy recommended by Mr Papineau could have no effect in preventing the appearance of the fly; and that the soaking of the seed grain can affect the future plant, so as to make it distasteful to the fly, at so late a period as when the new grain is formed, is scarcely possible.

Let any one observe the first appearance of the worm on the grain of wheat; a more orange speck, which, in a few days, arrives at its full size; it then crawls about the kernel, and lives upon the milk. In this state it is quite soft and easily crushed; but in a few days more it becomes hard, and will roll between the fingers. It is then transformed to the chrysalis, in which state it falls on the ground, or remains in the straw dormant, until the next summer's heat.

The gad fly continues its species by depositing

will make its appearance whenever the season is sufficiently hot, and such wheat as is so far advanced as to be fit to receive the deposit of its eggs is sure to be attacked, and the grain destroyed.

Now by sowing the wheat early, as is done on old lands, particularly in the French settlements, that wheat is sure to be in the ear when the fly comes, and the farmer's labor is lost.

From every information that I can obtain, I have found that in those parts of Lower Canada where wheat has been the least injured, the farmers are in the habit of sowing their grain much later than in the French settlements, as in the eastern townships, the new land in the rear of Beauharnois, and up the Ottawa.

In my immediate neighborhood, I have not heard a single exception, where the farmer's first sown wheat has not the most suffered, and the last sown the least.

Two years ago, a farmer of the name of Baptiste Lalonde, had a very good crop of wheat when all his immediate neighbors' crops were cut off. He sowed as early as his neighbors, but fortunately for him he was careless, and left his fences down, and his sheep and cattle were constantly in his wheat until late in the spring; by this means it was retarded and his crop saved.

Another man named Jaque Sinette dit la Rente, ploughed up an old meadow of about 13-4 acre of land, in the fall of 1836, intending to sow it in oats in the spring. It was consequently left until his regular wheat crop was put in, as well as all his other grain, when finding that he had no seed oats left, he sowed two minots of spring wheat late in May, and they produced him the large yield of 41 3-4 minots.

His regular wheat crop did not give him three seeds for one.

It will be observed that in this case the old sod had time to heat before the grain was sown.

In the spring of 1837, I sowed some wheat on the 26th May, and it was not in the least injured by the fly, nor suffered from the rust, but ripened perfectly well.

Last year I did not begin to sow wheat until the 20th May, and sowed some on the 1st June: the wheat again escaped the fly, nor did it suffer from the rust, so much dreaded by late sowing. As part of the land sown last spring had been in wheat the year before, there was to be seen now and then tufts of wheat far advanced of the others, probably the product of the seed fallen from the previous crop, and invariably every grain of that advanced wheat was destroyed by the fly, which shows that the enemy had been there.

I have never suffered much from rust, except when I have sown wheat immediately after manure,

I may be in error in the system I pursue, but I lay it frankly before the public; but I think I am not, and if it be the means of inducing more intelligent agriculturists to show their views of defeating the attack of these destructive insects, a great public benefit will be obtained.

I am, sir, your obedient servant,

R. U. HARWOOD.

Montreal, April 8.

ON KEEPING POULTRY.

Messrs Editors: I once knew a couple of industrious sisters, who lived near a never failing brook or stream in Massachusetts, who kept generally through the winter thirty geese, male and female. They had erected some suitable but not costly sheds, in which they had apartments for them to lay, set and hatch. Their food in the winter was meal of the various kinds, to some extent, but principally apples and roots. In the summer they had a pasture enclosed with stone wall, or board fence, which embraced the water. They kept their wings so clipped that they could not fly over such fence.— Their owners well knew (what we all know) that live geese feathers are a cash article, at a fair price. They picked off their feathers three times in the season. Those thirty geese wintered, would raise say seventy-five goslings or young geese, and of course they had that number to dispose of every fall or in the beginning of winter, when they are sent to market, and again picked, making four times that they obtained feathers from those they wintered, and twice from the young ones that they killed.

I tell the story to induce some family, sisters or brothers, fathers or mothers, situate near some never failing brook of water, to go and do likewise. Those remote from water cannot be benefited by the history, yet their friends may; but if I can by this account, cause one family to partake of the benefits of the business, I shall be satisfied. Many families there are, in all our towns, so situated that they may make the raising of geese a profitable business; yet perhaps have never thought of their privileges. It is known that we must import most of our feathers; and is it necessary to send abroad for an article so easily produced among us? Those who calculate to commence the business must prepare for it the ensuing fall, and not kill their geese. No one will object to the keeping of even more than thirty geese, if an enclosure is made sufficient to keep them at home and out of mischief.—*Maine Farmer.*

CHEAP MANURING.—Many farmers in this State of late years have adopted the practice of manuring their land for wheat the ensuing season, by turning in green crops. For instance, take a field

BOSTON, WEDNESDAY, AUGUST 21, 1839.

THIRD ANNUAL REPORT OF THE GEOLOGY OF MAINE
By C. T. JACKSON, M. D., Geologist to the State of
Maine. Augusta, pp. 556, Nvo.

We have had the pleasure of receiving this work from its learned and industrious author, and tender him our thanks. The acknowledgment should have been earlier; but on account of absence from home, and our necessary locomotive condition during the travelling season, our letters and papers are often long in reaching us; and many, we have reason to think, misrarry.

The limits of our paper admit only of a brief, and that must of necessity be a very imperfect notice of a work of this nature. It exhibits learning, ability, industry, and indefatigable perseverance; added to all this, an enthusiasm in the pursuit of its object, which is always sure of success where success is practicable. The work in connexion with the numbers which have preceded it, treats at large of the geological features and condition of Maine, and particularly with a view to develop its commercial, manufacturing, and agricultural resources and capabilities. In these respects, the Geological Survey has already conferred on Maine benefits of a substantial character, compensating fifty-fold the expenses which it has occasioned to the State. It has stimulated agricultural industry by the ample encouragements, which, it has shown, are inherent in the soil of many parts of Maine. It has awakened inquiry, enterprise, and experiment, bottomed upon rational grounds, which must lead to other discoveries and results of great importance and utility. It has increased much the estimation of the value of the lands in Maine, by demonstrating that, in spite of the rigors of its climate, agricultural industry may be exerted, and labor and capital expended in the improvements of many of her lands, with a certainty of such a recompense as ought to satisfy a reasonable mind. It has led to the correction of many mistakes in regard to earths and ores and stones, by showing their true character, which might otherwise have involved individuals in extensive and ruinous losses. It has checked in the bud many speculations, got up often through ignorance—we fear more often through fraud, by which hundreds may have been imposed upon, cheated, and robbed; and perhaps in their turn, on the miserable and detestable selfish principle of "save himself who can," have imposed upon, cheated, and robbed innumerable others. It has revealed the existence of metallic and mineral substances; and especially the existence of most extensive deposits and locations of iron ore and limestones, which are destined to prove to Maine richer or better sources of wealth than mines of gold, silver, and precious stones, or large deposits of the brightest pearl upon her rock-bound coasts. Besides this, it has served to enlarge the bounds of useful and practical knowledge, and is a valuable contribution to the science of Geology—a science highly interesting in all its aspects and relations to a philosophical curiosity; of great value in the useful and practical arts; and when profoundly studied even in its present imperfect explorations, revealing continually newer views and inspiring loftier conceptions of the power, wisdom, and benevolence of the Creator.

We speak of the imperfect explorations of the science of Geology; such they must be considered in respect to what remains to be done, before we can thoroughly understand this earthen ball on which we are floating and whirling through immense space and in the fath-

omless depths of ether. Geology is comparatively a recent science and still in its infancy. Its growth, however, has been rapid almost beyond example; and the interest which is now among the inquisitive so generally taken in it, in the old world and the new, will contribute to the rapid enlargement of its acquisitions.—Yet still, all the depth to which human inquiry has penetrated towards the centre of our earth, is hardly more than boring with a pin the varnish of a twenty-four inch globe. How much farther we can go it is not for any one to say. The human mind has not yet reached the end of its line in any science. We hope indeed it never will find a depth beyond which there is no lower depth; a height beyond which there is nothing higher. If the hero of Mæcedon wept because there were no more worlds to conquer, a deeper oppression would come upon the human intellect if it should reach an insuperable barrier to its inquiries, the actual limits of human knowledge, and there should be an end to all the activity and all the charms of inquiry and intellectual acquisition. The great delight of life is the consciousness of progressive advancement, intellectual and moral; and the great stimulus to exertion, by which all our intellectual and moral capacities are extended, unfolded, and strengthened, is the hope and prospect of farther acquisition.

We ask pardon, however, for being drawn aside by these general considerations, from the particular subject before us. The Report of Dr Jackson seems to be little else than a transcript of his diary. This is a popular form, and on that account the more attractive and interesting to the great mass of readers; but not a scientific form; nor that in which we know the learned author will choose his work shall appear in the sequel. Some one says that we follow a traveller with interest and pleasure, if he will but tell us where he oated his horse, and what the landlady gave him for dinner; but in scientific reports we consider this as extraneous matter. Now, whether the Dr, in some of his distant and fatiguing explorations, lived upon salt-pork raw or cooked; or whether his lust was accommodating and hospitable, or surly and discourteous; or whether his accomplished assistant, found under some hemlock "boughs sufficient protection for his head and shoulders, and left his inferior (or his superior) extremities to the kindly influence of a roaring camp fire," are matters in themselves entertaining, but not important; and though sufficiently amygdaloid and conglomerate in their character, are yet not exactly "in place" in a Geological Report. These slight blemishes in the mere style of the report, however, deserve no consideration in comparison with the importance of its general matter. The just apology for the form in which the report appears, lies in the unreasonable impatience of the public to know what their servants are doing, and in requiring them to present their accounts long before the expedition is finished. The evil in the case is first to the author's literary reputation and his own honorable ambition; but what is more, it is an inconvenient form for the public eye. The truth is, that so many subjects of inquiry are now pressing upon the public attention, and so many books of every description are pouring down upon us in a sort of avalanche, that we must utterly despair of keeping up with any thing unless knowledge and information, by those, who wish and who deserve to be heard, be presented in the most direct, systematic, and condensed form. This, we have no doubt will be done, at the completion of the survey. The survey, we trust, will be completed for the honor of our sister state, who, we believe, will have too much good sense and too much self respect to stop where she now stands in it. She is troubled, it seems, with some miserable quoms of

false and ridiculous economy in a matter where the expenditure of a few cents will be returned to her in thousands of dollars; and if she should persevere and make her suspension a cessation of this important survey, she would present herself in the aspect of the man, who is ready enough to cork his dozen bottles of champagne, to show his liberality to his guest; and then will deem it only a commendable economy to "beat down" the bill of his washerwoman. Maine, in her recent martial explosions, was quite willing to incur a debt of hundreds of thousands for the sake of showing her courage, and with a great flourish of trumpets marched her glittering battalions 'up the hill, and then marched down again' for the protection of a strip of wild land, of whose value she never dreamt, until it was pointed out by the learned geological surveyor; but we have no hesitation in saying that the perfect completion of this important survey, would confer upon the state more honor than all the flags of the British army captured from the enemy, and floating in triumph on the walls of her capital, if obtained in any contest whatever, where the point in dispute might be settled by honorable and peaceable negotiation.

Dr Jackson's report is divided into two parts—scientific and agricultural Geology. We shall at a convenient season take a more extended view of the report, especially of the agricultural Geology. This contains much important matter.

H. C.

THE SEASON.

The weather for the last fortnight on the sea coast has been cloudy and cold; and Indian corn seems to be at a stand. Its growth is very luxuriant, but it must do a great deal in a short time, if it means to get out of the way of the frost. This summer must be set down among the cold summers, though we have not had as in the cold seasons of 1836 and 1837, frequent frosts. In the year 1816 there was not a month without frost—1836 nearly resembled it. 1839 has been remarkably uniform in its temperature;—the mercury, we believe, has never risen above 90° Fahrenheit; and an unusual quantity of rain has fallen. The verdure through the season has been almost unexampled. The full moon in September usually brings a severe frost. Last year was, however, an exception. We hope this may be. A large portion of the corn now on the ground would be sily prepared for it. If it escapes that period we have then generally a favorable season in the latter part of September and October for its ripening. The smaller grains within our knowledge have in general been abundant; and are well secured.

H. C.

ANNUAL EXHIBITION OF MASS. HORT. SOC.

The Committee of Arrangements at their meeting this day, voted, that the Annual Exhibition of the Horticultural Society shall take place on *Wednesday, Thursday, and Friday, Sept. 25th, 26th, and 27th.*

Noted, That committees be chosen to visit the gardens and green-houses belonging to members of the Society, and solicit and select fruit, flowers, plants, &c., for the exhibition; and thereupon the following committees were appointed.

For Boston, J. E. Teschemacher, Isaac P. Davis, and W. T. Eustis.

For Salem and Lynn, Otis Johnson, and Mr Ives.

For Charlestown, Cambridge, and Watertown, David Haggerston, Wm. E. Carter, C. M. Hovey, Samuel Pond, and J. W. Russell.

For Brighton and Brookline, Jona. Winship, Joseph Breck, W. H. Cowen, and J. L. L. F. Warren.

For Roxbury, Col. Marshall P. Wilder, A. D. Williams, J. S. Gardiner, Samuel Walker.

Noted to adjourn to this day two weeks at 12 o'clock.

Per order. SAMUEL WALKER, Chairman.
Boston, August 17, 1839.

BRIGHTON MARKET.—MONDAY, August 19, 1859

Reported for the New England Farmer.

At Market, 280 Beef Cattle, 80 Stores, 30 Cows and Calves, 3950 Sheep, and 430 Swine.

Prices.—Beef Cattle.—We quote to correspond with last week, viz: First quality, \$5 50 a \$8 75. Second quality, \$7 75 a \$8 25. Third quality, \$7 00 a \$7 50.

Stores.—We were unable to quote prices. A very few only were retained.

Cows and Calves.—Rather dull. We notice the following sales, \$20 \$33, two at \$10 each, \$13, \$55, and \$60.

Sheep.—Old Sheep were dull. Lambs were in fair demand. Lots were taken for \$2 00, \$2 25, \$2 50, \$2 62, \$2 75, \$3 00, and \$3 50.

Swine.—On the decline. Lots to peddle were taken at 6 for sows and 7 for barrows. One lot, more than half barrows, 61-2. A few old hogs were sold for about 7c. At retail 8 and 9.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded Northerly exposure, week ending August 18.

AGRICULTURAL AGENCY.

The subscriber having been removed from the Post Office, by the pleasure of the President, and left for the residue without any means of support, has consented to resume the editorship of the "American Farmer," which he originally established, and the first periodical in America dedicated to the cause of Agriculture.—That resource, though "better than nothing," being altogether inadequate, as an additional means of livelihood, he has formed with his son, Theodore Elwand Skinner, a partnership to conduct an AGRICULTURAL AGENCY for the sale of real estate, and for the sale and purchase of domestic animals, horses, cattle, sheep and hogs, especially of improved breeds. Agricultural machinery and implements, seed grain, garden and field seed, and for sale of patent rights, *Morus Malticulis Trees*, &c. He will only add, that they will strictly guard the interests of their employers,—and that through them no humbugger shall be practised knowingly. Address, postage paid, to Baltimore, August, 1859. J. S. SKINNER.

TO WOOL GROWERS.

For sale a full blood Leistershire Ram, 3 years old this spring; was imported into this country, in May, 1838, by the present owner. This ram is particularly valuable to raisers of sheep, as he is very large and of beautiful proportions, and produces extraordinary long wool of the best quality. Apply to JOSEPH BRECK & CO.

STRAWBERRIES.

Those who are desirous of cultivating this delicious fruit are respectfully informed that the subscriber has succeeded, after a number of years experimenting upon the *Strawberry*, not only in obtaining new varieties, but in ascertaining the best method of cultivation.

Specimens of the fruits grown in his Garden have been exhibited at the *Massachusetts Horticultural Society Rooms* the four past years, and are also too well known in *Faneuil Hall Market* to need a particular notice here. He has for sale at his Garden in Brighton, Mass., the following eight varieties of Plants. They are of superior stock and quality, all warranted to be truly named and free from the mixtures often found in those offered for sale promiscuously.

Those who are in want of Strawberry Plants, are respectfully invited, and they will find it interesting, to call at the Garden and see the manner of cultivation. The method of cultivation, and any information desired will be cheerfully given.

The subscriber would state that from many years personal experience, he is satisfied that plantations of these vines made the last of July or early in August, by careful and constant attention will produce early or quite as much fruit the season following as those plantations made in the Spring will produce the second year.

Warren's Seedling Mithren.—A new and valuable kind. A free bearer, fruit very large and juicy; fruit measuring four and a half inches have exhibited the present season.

Methuen Castle.—Fruit extremely large, high flavored, and showy. Specimens of this kind have been exhibited at the Horticultural Rooms for two years past, measuring five and a half inches in circumference.

Bath Scarlet.—Fruit large, full bearer, and beautiful scarlet.

Early Virginia.—This is considered the earliest fruit—a free bearer, hardy, and very early; decidedly a fine kind for market.

Royal Scarlet.—Fruit long oval shaped and juicy.

Hutchins.—Fruit smaller but very numerous.

English Wood.—Fruit well known.

Monthly—Fruit is gathered from the vines from June to October, and in good quantity and fine quality. Orders left at the Garden, or directed to the subscriber, Brighton, Mass, or left at Messrs J. Breck & Co's Agricultural Warehouse, Boston, will be carefully and promptly attended to, and all Producers will be carefully packed and forwarded agreeably to directions.

JAMES L. L. F. WARREN.

Nonantum Vale, Brighton, Mass. July 17. 1859

New York Urate and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are not divided among the Stockholders, as are those belonging to another establishment, but sold to applicants, for cash on delivery. Orders are supplied in the order of time in which they are received. Urate 50 cents and Poudrette 40 cents per bushel, with contingent charges for bags or barrels, &c.

The company are daily preparing for use, during the warm, dry weather, the materials collected during the past winter, and will have several thousand bushels ready before the first of October next. The material is disinfected and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1838 and 1839, on Long Island, has satisfied many of the farmers that these manures have the quickest operation upon vegetable matter, producing greater abundance, and the cheapest of any manure they have ever tried. Amended instructions for their use, the result of practical experience, will be furnished on application. The effect of Poudrette upon Grape Vines and *Morus Malticulis* is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manures, and farmers and gardeners may confidently rely on a supply of Urate and Poudrette. The New York Urate and Poudrette

From the Connecticut Courant.

NATURAL HISTORY.

Sagacity of the Land Tortoise.—Some time in June, 1828, an animal known here by that name was found in my garden, in the act of treating himself to green peas, small cucumbers and melons, among which he had feasted several days, but the trespass had been attributed to the hens and chickens. Being unwilling to put him to death on the first conviction, a small hole was bored through the skirt of the upper shell, and a small cord of two or three yards in length was attached to it, and he tethered out in a convenient place a few rods distant from the garden vegetables, and marked on his breast-plate, "S. H. W. 1828." The next day it was discovered that he had made his escape, having gnawed off his "tether string." A few days after this he was again detected in the same place of his former trespass, and to secure him from committing further depredations, a small ring of iron wire was linked into the hole of the shell, a more substantial cord attached to it, and the prisoner again placed upon his tether. This, however, proved insufficient for his safe keeping. The new cord was soon severed, and the vagrant carrying off with him his iron ring and a small part of the cord, made a second escape. In June, 1829, "Monsieur Tonsen come again!" and was detected in his old line of business. A trial for his crimes was instituted—the evidence against him was too clear to admit of doubt—he was found guilty—the number of peapods, cucumbers and melons of different kinds which he had clamped and ruined, was ascertained as nearly as might be, whereupon the court, consisting principally of the females of the family, sentenced him to be immediately put to death by decapitation. But the poor convict had one friend in the court: that friend exerted his influence, and finally obtained a commutation of the punishment from death to transportation, without limit of time. Pursuant to this order he was conveyed to a small pond about a quarter of a mile from the garden, the scene of his transgressions; but, not pleased with his accommodations among frogs and other creeping things, soon found his way back to his old friends and their garden. He was then carried nearly half a mile in an opposite direction, and thrown into a small handy brook environed with bogs and sedge grass.

In June, 1832, who should appear but our old visitor again, with his marks and iron ring! What should now be done? The majority of the court denounced him an outlaw and utterly beyond the reach of mercy. His friend and advocate, however, urged in behalf of the convict that the sentence of transportation was *without limit of time*, and assured the court that if a convenient opportunity should offer, he would send him next to Botany Bay—but if not, he would pledge himself to carry him to a place so distant that little fear could be entertained of his returning again to his old haunts. Upon these terms a respite was obtained, and his sponsor caused him to be transported to Suffield, and there left in a grass field a little north of the meeting house. This expedient served for that year; but in June, 1833, we had the pleasure of another family visit from our old acquaintance. By this time the resentment which had been felt toward him had, in a great measure subsided. He had become a sort of pet, and as we had a plenty-

ful supply that year of cucumbers and other garden vegetables, he was allowed the whole range of the garden. But to fulfil my engagement as his surety, and as no opportunity offered to ship him off to Botany Bay, I wrapped him up in a piece of old carpet, so that he could have no means of noticing objects, carried him to Popponoe and threw him into a small stream in an alder swamp near Rainbow Mills. But, "true as the needle to the pole," he renewed his visit in 1835, but manifesting a desire to tarry with us longer than his company was agreeable, he was carried to, and left in a brook near the foot of Turkey Hills mountain. On the 20th instant, he obliged us with another call, and, as I suppose, is yet in my garden.

He appears in fine health, plump and lusty, but has no discernible increase of size, nor appearance of advance in age since my first acquaintance with him. He yet wears his iron ring—the initials and date on his breast-plate, though rendered somewhat obscure by abrasion, are yet legible, and leave no possible doubt of his identity.

SAMUEL WOODRUFF.

Windsor, July 25th, 1836.

THE END OF "GREAT MEN."

Happening to cast my eyes upon some miniature portraits, I perceived that the four persons who occupied the most conspicuous places were Alexander, Hannibal, Cæsar and Bonaparte. I had seen the same unnumbered times before, but never did the same sensations arise in my bosom as my mind hastily glanced over their several histories.

Alexander, after having climbed the dizzy heights of ambition, and with his temples bound with chaplets dipped in the blood of countless nations, looked down on a conquered world and wept that there was not another world for him to conquer,—set a city on fire, and died in a scene of debauch.

Hannibal, after having to the astonishment and consternation of Rome, passed the Alps—after having put to flight the armies of this "mistress of the world," and stripped three bushels of golden rings from the fingers of her slaughtered knights, and made her very foundation quake, was hated by those who once exultingly united his name to that of their god, and called him "Hanni Baa!," and died at last by poison administered by his own hand, unlamented and unwept, in a foreign land.

Cæsar, after having conquered eight hundred cities, and dyed his garments in the blood of one million of his foes—after having pursued to death the only rival he had on earth, was miserably assassinated by those he considered his nearest friends, and at the very place the attainment of which had been the greatest object of his ambition.

Bonaparte, whose mandate kings and princes obeyed, after having filled the earth with the terror of his name, and after having deluged Europe with tears and blood, and clothed the world in sackcloth, closed his days in lonely banishment, almost literally exiled from the world, yet where he could sometimes see his country's banner waving o'er the deep, but which would not, or could not bring him aid.

Thus these four men, who from the peculiar situation of their portraits, seemed to stand as representatives of all those whom the world calls 'great'—those four who severally made the earth tremble to its centre, severally died—one by intoxication, the second by suicide, the third by assassination, and the last in lonely exile!

"How are the mighty fallen!"—*Maine Farmer.*

ODDS AND ENDS.—We are remarkably well pleased with the rebuke which Wm. Gray, of Boston familiarly termed "Billy Gray," once gave. He happened to be at market one day, when he heard a spruce young lawyer who had just opened an office for the practice of his profession, inquiring for some one to carry home a piece of meat for him, which he had been purchasing. Stepping up to the man of law, said Billy to him, "Sir, I will carry your meat." "Very well," was the reply, as it was handed to him, and he led the way through the streets, while he was followed to the no small amusement of those who happened to know him. Having arrived at the house, the attorney inquired what was to pay. "A shilling, sir," replied the carrier, which having received and bowed politely, he thanked the lawyer, and told him "whenever he wanted a similar service done, to call on Billy Gray." As might have been expected, the man was astounded at the announcement of the fact that a man worth as many millions as he was tens, had condescended to do this piece of drudgery for him, and so great was his mortification at the rebuke he had received, that he never again sought for another person to do a job which he could as well do himself, if the whisperings of pride were only silenced.

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street.

July 10.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

[NO. 8.

N. E. FARMER.

NOTICES OF FARMS—MINUTES BY THE WAY, &c.

Notice of the Farm of E. Phinney, Esq., concluded.

The orchard on this farm is equal if not superior to any we have seen. It contains from 400 to 500 trees, principally Baldwins, Russets, and Rhode Island Greenings. It produced a very abundant crop last year, but this year there is scarcely an apple upon it. It was planted somewhere about 14 or 15 years since. The soil is generally a light rich loam, upon a gravelly, and in some places a rocky foundation. The trees were taken from the nursery in autumn, and placed in trenches until the following spring. They were planted near the surface, and in many instances, upon the surface, without digging any holes, and the dirt placed upon the roots. The orchard is situated on a side hill, having a south and southeast exposure. Many of the trees were severely injured by the hard winters of 1835 and '36, which caused the destruction of some of them. Their places have since been supplied with young trees. The mice injured some of the trees a number of years since, by gnawing the bark, so that in some cases the trees were completely girdled, and to all appearance lost. An ingenious method was devised to save them. Having prepared some large scions, five or six of them were inserted in each tree below the wounds in the bark, and then connected with bark above by the common operation of side grafting: in this way the sap was conducted from the roots to the top and the trees saved. We saw some of the trees thus operated upon: the scions had increased to the diameter of 3 or 4 inches, and had nearly come in contact with each other: we should doubt, however, whether the trees would be long lived, as the old wood must be unsound, and an early decay must be the consequence. The trees appeared now as vigorous as any of their neighbors. The orchard has never been laid down to grass, but kept in constant cultivation. The trees are finely shaped, having been pruned with a skillful hand, and just high enough from the ground to work under without inconvenience: the trees are about two rods apart: in some places they nearly cover the ground. We do not remember how many barrels

at 10 to 12 cents per pound. The crop was said not to be so heavy this year, but to us it appeared very great. There is also a small house where the more delicious foreign grapes are grown.

The plums had suffered severely from the curculio, and most of the trees had lost their fruit.— There is a disease upon the currant bush which we have noticed in many other places as well as on this. The bush loses its leaves prematurely, and the fruit becomes withered and worthless. We have in vain sought for the cause. Can any of our readers inform us, and prescribe a remedy?— The vegetable garden is large and well stocked with every variety: what is not consumed in the family is marketed or fed to the swine.

Mr Phinney has taken great pains to improve his breed of swine, and probably there are none superior in the State. As we have a promise from him of a description of his pigs and piggery for the N. E. Farmer, we shall not enlarge upon this subject. He prefers a cross of the Berkshire and Mackey to any other, and most of his pigs for slaughter are of this description. He has the full blooded Berkshire, Mackey and other breeds, and mixes to suit himself. We noticed a sow lately imported from England, called the Essex half black: the hinder part of the animal is jet black, and the forward half white. There are some good points about her, and she may prove a valuable acquisition to his stock: not having recovered from her sea voyage, she does not appear now as she will after a few weeks of good keeping. There is an old sow here, quite an object of curiosity, (we do not recollect the breed,) that weighs 900 lbs., a monstrous overgrown animal: she had been turned out of her pen to enjoy her liberty a little, which she did not however, seem to appreciate much, as all the room she wanted appeared to be enough to turn round and lie down upon. She looks as though she might be the parent of a most numerous offspring, but we understood she was without issue, having apparently no inclination to form an intimacy with the other sex. The number of swine is about 140, the care of which employs one man constantly.

The barns and other buildings for the accommodation of stock are convenient and comfortable, with sufficient room for the hay and grain produced on the farm. About 100 tons of hay are cut an-

the quantity of meadow manure. One cord of this composition is considered about equal to one cord of stable manure alone.

In making our observations upon this place, we feel as if it was not in our power to do it justice, as we spent but a few hours upon it. Every part of it shows, that by science, industry and skill, it has been rendered worthy of being ranked among the first of well cultivated farms in New England, and its proprietor worthy of all praise for the laudable example he has set for the imitation of his agricultural brethren.

Notice of Improvements on the Farm of Col. Abel Moore, Concord, Mass.

The traveller who has been accustomed to pass from Boston to Concord by the old road or turnpike, has, without doubt, noticed the large tract of meadow lands southeast of the village, which a few years ago was an unproductive waste, or large portions of it, and still there remains much to be subdued: yet those who have an eye upon agricultural improvements, must have observed with pleasure, that every year encroachments have been made upon these unproductive grounds by the hands of the cultivator, and the land which was considered nearly worthless, producing nothing but alders, dogwood, branches, skunk cabbage and other useless trash, is now burdened with heavy crops of grass, corn, oats, &c.

Tapping up the turnpike from Lexington to Concord, we were struck with the vast difference between that which had been subdued, and that which was in its natural state, as they were divided only by a ditch. Finding this part of the meadow belonged to Col. Moore, we called upon him, and were politely asked to look over his farm. He owns a large tract of this meadow, which with some dry, gravelly hills to the north, amounts to about 230 acres, all in one body. He informed us that he had 30 acres of reclaimed meadow, which for a grass or any other crop, he was not afraid to compare with any 30 acres in the county of Middlesex, that might be selected from one or a dozen different farms. This we thought to be a strong assertion, but from what we saw of his grounds, and the crop secured in the barn, cannot see how it is possible to obtain larger crops than he has. He cut last year from 84 rods of this meadow, by actual

tions are connected by wooden bridges. The manner of bringing the meadows into cultivation has been, after ditching to extract the bushes, paring the hammocks, turning the sod, and carting on gravel. His gravel and loam is near at hand: 4 loads to the square rod is spread upon the surface of the turned sod, to which is added a good dressing of compost, and the ground is ready after harrowing, for the grass seed or for any other crop.

Col. Moore has lately put up a commodious and substantial barn, 80 feet by 40, with 23 feet posts; which his increased crops have made necessary to erect, with a cellar under the whole, having solid split stone walls, and split stone supports for the cross timbers. The cellar has two entrances on the south of sufficient width to admit a cart: this is the most valuable part of the barn, as it affords ample room for manure; a fine warm apartment for his breeding sows in the winter; a secure place for his roots, and for his carts, plough, &c.

He has another barn devoted exclusively to grain; and another still for hay.

His wheat crop has succeeded very well this season: the variety raised, the Tea wheat.

Col. Moore has the Berkshire and Mackey pigs, and raises many of a mixed breed for sale, which bring a high price. Among his breeding sows, he has one that has raised nine litters of pigs, and never had less than ten at one time, and sometimes more, but always brought up just ten: she is now in a fair way to have the tenth litter, and it would be a great pity that she should have less than her usual number, or be less successful, so that it may be said, she has brought up 100 pigs at 10 litters; she ought then to be excused from further service.

We will forewarn those farmers who are about to improve their peat meadows and other grounds, that if they persevere they will be involved in some expenses which if they were neglected might be saved. We allude to the erection of barns for hay and grain and accommodations for cattle, &c. We have heard complaints from a number of good farmers on this score,—they say their barns are not sufficient for their increased products; that they have been adding from time to time a little piece or a small building, and now they find them inconvenient, and that they shall be obliged though reluctant, to "pull down and build bigger," that they may have room where to bestow their hay and their grains, &c. That nothing worse than this may befall them, is our hearty wish. J. B.

Mulberry Trees, Silk, &c.—The following sales of trees have been communicated to us, and may be depended on as being accurate:

At Carlisle, Pa., last week, a sale of 1000 trees was made at 50 cents each, taking every tree in the row, cash on delivery; 8000 were sold at Denton, Md. for 50 cents, another lot at 45, and one at 35; at Centreville, sales have been made at 30 and 60 cents; at Norfolk, Va., a lot of 70,000 were sold at 30 cents, the seller having the privilege of summer layering until the first of August; the buyer takes every thing on the ground in the fall, one foot high and over. In this city we know of one sale at 50 cents, and have heard of others as low as 37 1-2. There are buyers in the market purchasing trees for the west, yet the sales during the past week have not been very numerous. We have heard of various transactions, but are not well enough assured of their correctness to announce them in our price current. Growers are firm in their prices, and there is not the slightest disposi-

tion to take any less than we asked three weeks ago.—*Morris's Silk Farmer of Aug 10.*

American vs. Foreign Silk.—The extravagant fabrication which is being industriously circulated by some over wise gentlemen, that there is no mercurial silk reeled in this country, was a few days since adverted to in the presence of Mr Cheney, of Burlington. He replied that recently he had used in his factory about 4000 pounds of foreign silk, for which he paid an average price of \$4 75 per pound. At the same time he was purchasing American reeled silk at six dollars a pound, on which he made a larger profit than on the foreign. Another gentleman was mentioned who sold his raw silk at six dollars a pound for all he could raise. It is becoming notorious to all who use sewing silk, that the American manufactured article is far superior to any foreign, and besides it is not saturated with the deleterious ingredients used by all foreigners to make the silk weigh more.—This substance usually composes 25 per cent. of Finisio's superior silk.—*lb.*

From the Albany Cultivator.

MR. GARNETT ON THE APPLICATION OF MANURES.

(Concluded.)

My belief, founded on the facts already stated is, that all the fertilizing substances of manures are soluble in water, and will remain uninjured themselves and useless to plants until the solution begins, whether they be deposited on or under the earth's surface. I also believe that this solution is caused by every fall of rain, and is immediately absorbed by the subjacent soil, which absorption results from two causes; first, the principle of gravity, and secondly, the stronger attraction of the earth than of the atmosphere, for every substance in solution which constitutes the food of plants. Moreover, that the earth never parts with this food when thus absorbed, to any thing but the plants themselves; for it is their peculiar aliment, and not that of the atmosphere, whose existence, for aught we know to the contrary, is entirely independent of it, although its agency seems essential to the health and vigor of all plants. If this were not the fact, if, for example, the earth did give the best and greatest portion of this food to the atmosphere, or if it escaped from surface-spread manure, before gravity and attraction could impart it to the earth, then the evaporation which is supposed to be the medium of conveyance, and which is known to be constantly going on from the soil, would, in process of time, certainly render it barren, even without any cultivation whatever. Yet neither total nor partial barrenness is ever known to be produced by any other cause than incessant culture without manure. That evaporation does take off something from manure while in a moist state, is proved by the offensive smell which constantly exhales from it until it is entirely dry. This smell is excited by a gas which is said by some, to contain the most valuable portion of the food of plants; but admit the fact, where is the proof of this portion being lost? I say there is none. On the contrary, we have what I think a conclusive reason for believing that this food is immediately given by the atmosphere to the tops of plants, as more suitable to them than to their roots. My reason for this belief is, the result of the following experiment which I have known to be repeated several times. All the bark was taken off from around the body of certain young

trees, in a ring about three inches wide, for the purpose in the first case which I saw, of ascertaining whether this process would not kill the tree. But to the surprise of us all, not more than a year or two elapsed, before that part of the body above the ring became obviously larger than the part below, and this difference in size increased every year afterwards, as I had frequent opportunities of noticing.

Another reason why I believe that manures act better if spread on the surface of land, than when buried under it in the customary manner, is, that in the first case, the rain water carries the dissolvable substances no deeper than the roots of most of our cultivated plants always grow, unless they are forced out of their natural course; and there these substances remain fast held by the earth's chemical affinity, until the stronger attraction of the spongiololes of the roots begins to act upon them. But in the second case, that is, where manure is ploughed under as soon as spread, all the food of plants contained therein, being placed at once quite as deep as their spongiololes naturally grow, and this too, before the rains begin to dissolve it, the subsequent solutions caused thereby, necessarily sink still deeper, and generally beyond the reach of the plants for whose nourishment they are designed. In no other way can I account for the long noticed and invariable superiority of crops produced by surface-spread manure, to those produced by that which was ploughed in. To me there appears to be but this alternative, either to deny the facts already stated, which I myself have often witnessed, or to explain them, (if we must theorise on the subject at all,) in some such way as the one which I have just offered to your subscriber, and to such others of our brethren as may choose to examine it. Permit me further to add, that on this subject nature herself seems to offer us a useful lesson, if we were not too wise in our own conceits to be taught by such an instructress; for I know not a single exception to her practice of depositing on the earth's surface all the putrescent substances of every nature and kind which appear designed to preserve her fecundity.

In close connexion with this subject, there is one other matter on which I will take the liberty to express an opinion, although your subscriber has not asked for it. This is, in regard to the best state in which manure can be applied. So far as my own experience enables me to judge, an experience confirmed by that of many others in whose practical knowledge of the subject I have great confidence, I believe that the fresher it is the better; for in such state, so much less will suffice than in any more advanced stage of putrefaction that time, labor and value are all saved in the application: while none of the alleged "burning" ascribed to the manures being "too hot," ever occurs, if the quantity used be lessened in proportion to its freshness. This injury to plants, if I mistake not, is always caused by excess in the quantity and not by the quality of the manure we apply to them, although the two things are often confounded, and thereby contribute to the perpetuation of error in regard to the nature and operation of all fertilizing substances. There is not, I believe, an agriculturist of any experience in our country, who has not had frequent opportunities of witnessing numerous facts to prove the correctness of these opinions. But, as I before remarked, we are vastly fonder of our own fancies, than of facts in opposition to them; and consequently pass all such

without notice, or when too strong and obtrusive to be entirely disregarded, we spare no labor nor pains to force them, as far as we possibly can to subvert some previously conceived notion which our silly pride forbids us to abandon. This obstacle to the progress of all improvement, but especially in husbandry, is one of the most pernicious of our besetting sins: and but for this, it seems to me impossible that any controversy should still exist in regard to the best manner and state in which to apply manures to land. Two or three years, at most, would have been amply sufficient to establish the most beneficial practice, if all those whose special interest it is to ascertain it, would have diligently and impartially resorted to comparative experiments, accurately and assiduously made for the purpose, rather than to speculating and theorizing about it. But it can never be too late to make such experiments. Let me therefore, most earnestly but respectfully recommend to your subscribers who has done me the honor to ask my opinion, as well as to all others who may still have doubts on the subject, forthwith to commence making trials of the different methods of applying manures, and also of the different states in which it is applied. The opinions of experienced men are certainly well worth consulting, in regard to all matters connected with their respective trades, professions or callings; but we should never implicitly take them as guides for our own practice any longer than until we can have leisure to test their correctness by actual experiments. When a number of these concur in producing the same uniform result, it is a matter of very little comparative importance how others may endeavor to account for the fact, as the fact itself is the all important thing, especially in every practical art. But this war between speculation and practice, between nature's own coings and our fanciful ways of accounting for them, is destined, I fear, never to cease, so long as such a thing remains in the world, as pride of opinion. Let a man once commit himself so far, either in speaking or writing, as publicly to deliver what he considers an argument in support of his "ipse dixit," and there are a hundred chances to one that he persists in it to the day of his death.

In thus complying with your subscriber's request, I may perhaps have said more than either he or you expected or wished: If I have done so, I must rely for my excuse on the proverbial garulity of old age, unless your own kind feelings will suggest a better.

I remain, dear sir, yours very respectfully,
JAMES M. GARNETT.

Massachusetts Horticultural Society.

S. Walker; Hero of Tippecanoe (fine), Unique, Quilled Perfection, Premier, Glory, Sir Robert Peel, Don Carlos and William Cobbett.

Native plants, by E. Weston, jr., Esq., and Francis Parker; Penitourum segoides, Hypericum pabifolium, Cunila miseroides, Hypericum Virginiae (in fruit), Aster pulegioides, Polygala sanguinea, Gerardia maritima, Junceus effusus, Cistus Canadense, Mentha Borealis, Gnaphalium Polyccephalum.

By Wm. Oakes, Esq.; Goodyera pubescens, G. repens, Collinsonia Canadensis, Lobelia cardinalis, Solidago juncea? Clethra alnifolia, Ranunculus reptans, B. filiformis, Apios tuberosa, Orchis Blephariglotis (bad.), Lechea racemulosa, Satix pedicularis, Eupatorium ageratoides, Corylus rostrata.

For the Committee,

S. WALKER, *Chairman*.

Voted, That the Welles Premiums for the best apples cultivated from seedling trees, be awarded on the second Saturday of January, 1840—and that the next set of premiums be established and declared at the same time.

First premium, \$30; second, \$20; third, \$10.

To be not less than four dozen in each specimen.

VIRTUES AND VALUE OF THE MORUS MULTICAULIS.

This is an age of discovery and improvement, and there is no knowing what may yet be brought to light, respecting the value and virtues of the *Morus Multicaulis*. It was thought but a short time since that this noted tree was fit only for feeding worms for the production of silk: even for this purpose alone the value of the tree could hardly be calculated; but it appears that the public have had but faint conceptions of its worth. We now learn that the leaves make delicious pies, and excellent greens, as well as furnishing the best of fodder for cattle; and last of all, and not least, that they make first rate hyson tea! What next! We do not see the necessity now of troubling ourselves with feeding worms, or the useless expenditure for building seraperies. Let the leaves be fed to our

who can estimate its worth? As for ourselves, we have doubled the price upon our own trees, and hope other growers will do the same.

We extract the following from the American Silk Grower, that our readers may not think we are wild.
J. B.

It is amusing to see by the papers how many valuable qualities the *Multicaulis* plant is discovered to possess.

By the following it appears it makes tea equal to the best hyson. Mr Freas, the publisher of the Germantown Telegraph, has discovered that the leaves make delightful pies. It was before known that they made excellent greens—and for cattle fodder, superior to every other article. But the tea, make us the tea!

Morus Multicaulis Tea.—A very important discovery has been made at Augusta, Georgia, of the virtues of the *Morus Multicaulis* leaves. The Constitutionalist says:

"We were shown a sample of tea the other day put up in paper, which we pronounced on the smell, fine Hyson tea—but imagine our surprise, on making the inquiry (as good teas are scarce in this market,) where it could be obtained, when we were informed that instead of Hyson, it was prepared *Morus Multicaulis!* There was just enough for a drawing, so that we could not obtain a supply for a trial; we learn, however, from the individual who did make the experiment that it made good tea, and that if properly prepared, he thinks good judges could not detect the difference between it and the best Hyson. The way it was prepared was as follows: the leaves were in the first place cut into thin strips, then rolled up and put away in the shade to dry, after remaining in that situation some five or six days, they were placed in the sun for a few hours. If the *Morus* will make good tea, good bye to the silk fever, which at the present time is raging—good-bye to our China trade—and an independent fortune to our *Morus Multicaulis* planters, for their wild calculations will be more than realised."

The use of Sulphur in preserving plants from insects, is recommended by Dr MEASE, in the Domestic Encyclopedia. The recommendation is endorsed by the editor of the Cultivator in his last number. He states that dusted upon grapes, in the grape house, they have prevented mildew upon the fruit. "It is equally efficacious in the open ground, till the sulphur is washed or blown off. For many years, we have lost most of our early cabbages by a maggot which preyed upon the stem under ground. By mixing sulphur with the ground in which the roots of the plant are dipped before

LOOK OUT FOR ANOTHER PANIC.

The New York Times gives the following statement of the amount of duties paid in the district of New York during the first quarter of 1838 and the first quarter of 1839:

1838,	\$2,407,755 78
1839,	4,309,500 21

Difference, \$1,901,744 43

Now, if we assume this as a criterion for the three coming quarters of the year, it will give an aggregate of \$7,606,972 72, as the amount of duties upon foreign importations, paid in the district of New York, in 1839, over and above what was paid upon the like importations in 1838. This immense sum of seven and a half millions of dollars, the reader will bear in mind, is not the cost of the foreign articles we import, but merely the duty which is exacted by our laws on their introduction into our country. And if we consider that almost every foreign article not coming in competition with our own manufactures, is imported duty free, and that many other articles pay merely a nominal duty, we may with safety assume that the duties payable at the custom house do not amount to more than one-tenth of the cost of the foreign merchandise imported. We arrive, then, at this result, that the foreign goods imported into New York during the present year, will exceed in amount the importations of 1838, SEVENTYSIX MILLIONS OF DOLLARS!!

And who is to foot the bill?—who is to pay the balance? Here is an extra charge against us in a single port, of seventy-six millions of dollars, in a great measure for articles which we can either produce within ourselves, or do without. We may boast of this as an era of commercial prosperity—we may boast that it fills the coffers of our national treasury—but we cannot conceal the apprehension that it is pregnant with future and direful evils to our country: that it is the prelude to another commercial panic more dreadful in its effects than the one from which we are just recovering. Really, we are getting commercially mad. Like the reckless spendthrift, we are embezzling our patrimonial inheritance, entailing upon our posterity a ruinous debt, and compromising our independence as a nation, from a vain ostentation of buying what we do not want, or what at all events we are unable to pay for.

We repeat the question—By whom and how is this seven-six millions of dollars to be paid? Paid it must be, if we would sustain our character for honesty and fair dealing. The total amount of our exports is but a little over one hundred millions—some millions less than our imports of last year: and according to the data we have assumed, they are likely to fall short of the imports of the current year from fifty to a hundred millions of dollars. Our state stocks have, to the amount of one hundred and seventy millions, been already sent abroad towards paying old balances; some considerable portion of our bank stock has been employed for a like purpose; and, abstracting the exports of cotton, exclusively the production of the south, our exportations will not pay a tithe of the rapidly accumulating debt.

What does this state of things augur to our manufacturing and agricultural interests? This seventy-six millions of foreign merchandise has and will be spread over our country, and must and will be sold, though at a sacrifice to the holders; and sup-

plant, in no small degree, the sales of domestic goods. Our manufacturers will consequently become cramped; their business will be contracted; many mills be stopped, and many failures ensue. The evils to the agriculturist will be, the loss of the market: to the manufacturer, of his provisions and raw materials, a diminution in their price, and a participation in the evils of another commercial panic.

Our anticipations may not be realized; yet the facts upon which they are founded, are such as should put every prudent man on his guard—as should render him cautious of running in debt, particularly for foreign merchandise, and as should induce him, in all cases where it is practicable without a great sacrifice, to give a preference to domestic over foreign productions. The patriots of our revolution could forego the use of foreign goods, and their wives and daughters the use of their favorite beverage, tea, for their country's good. The sons surely have not so degenerated, as to be unwilling to adopt, in part, to maintain their independence, that policy which their fathers employed to achieve it.—*Albany Cultivator.*

Gideon B. Smith estimates that the number of Multicaulis trees throughout the country will not be more than one-fifth the number of buds planted out. There is no doubt that the failure of the buds to germinate has been general; and we think Mr. Smith's means of forming a correct estimate are as good as those of any other man in the United States. Nor is he one of those who would lend himself to the vile purpose of assisting to create fictitious impressions in view of playing into the pockets of humbuggers and speculators. But we advise those who think of commencing the silk business next year, not to make contracts for multicaulis trees till after they have ceased growing the present season. Whoever buys trees yet to be delivered, assists in sustaining the present humbug prices. We are earnest advocates of silk culture; but buying and selling trees merely, is not feeding worms and making silk. There are three classes of men in this country who style themselves silk culturists—the humbuggers, the humbugged, and the actual producers of silk. The two former are displaying at present more zeal in their operations; but the latter is laboring more honestly, and will in the end, we trust, be more successful. The genuine friends of silk culture should discriminate between these classes.—*Franklin Farmer.*

THE PROPERTIES AND USE OF SOIL AND SUBSOIL.

Although it has been shewn that there is an intimate connexion between the nature and properties of the soil and those of the subsoil upon which it rests, yet we would wish it to be understood that the nature and quality of the materials of which the soil is composed, has not so much to do with its productiveness, as the mere mechanical mixture of its parts, by which it is brought into such a state of friability as to enable it to retain moisture in dry seasons, and give off by filtration its redundant moisture during a continuance of wet weather. When soils are not naturally in such a state of friability, they might be made so artificially by a proper admixture of clay, if too light or sandy; and by an admixture of sandy matter, when too strong and adhesive.

Silicious sandy soils soon decompose the manure

bestowed upon them, which is carried off by water and evaporation.

These are called hungry soils.

Soils on a dry porous subsoil are more easily dried by evaporation than when the subsoil is clay or marl.

A dry, light, sandy soil on a clay subsoil, is more productive than on a sandy, gravelly subsoil, and it also supplies the means of its permanent improvement by mixing some of the subsoil with the soil.

The best constituted soil is that in which the earthy materials, the moisture and manure are properly associated, and on which the decomposable vegetable or animal matter does not exceed one-fourth of the weight of the earthy constituents.

Putrefaction goes on very slowly in strong adhesive clays, while in sand and gravel the process is very rapid. In quick lime it is more so than in sand, but carbonate of lime or effete lime retards the process of putrefaction more than sand or clay. All earths have an affinity for, or the power of, retaining the gas or effluvia from the fermentation of animal and vegetable matter which takes place on or near their surface.

None of the primitive earths, when pure or un-mixed with others, are capable of supporting vegetable life; they are neither convertible into the elements of plants nor into any new substance by any process naturally taking place in the soil.—When they are component parts of the soil, they merely act as mechanical agents for the support of the plant, and prepare a bed in which the roots sink and extend themselves for the purpose of fixing their position, thus forming a natural laboratory in which the decomposition of organic matter is carried on, and where it is reduced to its original elements for the reproducing of plants.

A soil that is formed of nearly equal parts of the three primitive earths, namely, sand, clay, and lime, with a mixture of decomposing vegetable and animal matter, imbibes moisture from, and gives it out to the atmosphere, and has all the principles of fertility which give life and vigor to the plants that grow in it.

The properties of a good soil should be so friable and porous as to permit the roots of plants to strike freely in every direction in search of nourishment, and to allow the superfluous water readily to pass off through the subsoil, but to be sufficiently tenacious to retain moisture for the support of plants when in full vigor.

Fertile soils must be composed of silicious sand, clay, and calcareous matter. "The proportion," Kirwan says, "where rain to the depth of twenty-six inches falls per annum, is sixtysix per cent. of sand, fourteen of clay, and thirty of calcareous matter." But these proportions depend entirely on the climate, the situation, the nature of the subsoil, and other local circumstances. More silicious sand is required in proportion as these circumstances tend to make the soil wet; and more clay, if they tend to make it dry.

The constituent parts of a fertile soil should bear a certain relative proportion to each other; but if any of these prevail or fall short to a certain degree, the soil becomes less productive.

The proper proportion of the primitive earths to form a productive soil under these circumstances, may vary from 50 to 75 per cent., of silicious matter; from 20 to 40 of clay or aluminous matters, and from 10 to 20 of calcareous matter.

According as the climate is moist, the soil should

be friable and porous; according as it is dry, the soil should be adhesive and retentive.

The most productive soil is that which is so constituted as to maintain such a degree of moisture in very dry and in very wet seasons, only to give a healthy supply of it to the plants. Such a soil gives to plants the means of fixing their roots deep to support them during the period of their growth, and allows them to ramify in every direction in search of nourishment where they may easily abstract the elements of vegetable life, without being injured by a redundant or a deficient supply of moisture, during any period of their growth. A constant supply of air and water is necessary to make and keep the soil permanently productive; when the soil is easily made and kept friable, it will also have the power of absorbing, retaining, and decomposing the water, the air, and the organic matter, which may be in its composition, by insensible fermentation; and give up a constant supply of the results of this decomposition for the growth of plants, either at seed time when they are merely vegetating, in summer when they are growing with the greatest luxuriance, and in autumn, when they are ripening their seeds for harvest.—

Morton on Soils.

From the Franklin Farmer.

A LAZY FARMER.

It does not require much discrimination to know a lazy farmer; nor is it absolutely necessary to witness the personal habits of this peculiar variety of bipeds, in order to bestow upon him the title by which he is designated as above, on the authority of observing naturalists. "By their fruits ye shall know them," is as applicable to farmers as to any class of saints or sinners. A glance of the eye on a farm is enough to enable you to decide, and most correctly too, whether a lazy or industrious man lives there. If a lazy man, you will know it by the first objects presented to view; and you may look in vain to find any thing on the farm to counteract the first impression. Dilapidated houses—fences low and without stakes, surrounded by bushes, briars and weeds—rails thrown off and holes stopped with chunks—no gates, no draw bars, no fruit but blackberries—bad crops—the soil of the farm washed into the unstopped gullies, and the yellow bald spots on every slope making your eyes ache—poor, burry sheep and poorer cattle—in short, farm, houses, man, wife, children, servants, all present the same doleful and degrading aspect. And yet these fellows, wherever found, have a hundred excuses for their abominable laziness.

There are many such farmers; but Thomas

skin. The present Clearfield, who is the subject of these remarks, is better known by the name of "Uncle Tom." Ask man, woman or child, "who lives at the big briar patch?" and the answer will be, "Uncle Tom;" and it has come to be a proverb among his neighbors, when they see a farm beset with blackberries, to say "Uncle Tom lives here." If you should ask what kind of man he is, you will have for answer—a lazy, trifling, good-for-nothing, good hearted sort of a fellow.

Uncle Tom, like the rest of his kindred spirits, will give a thousand excuses for his laziness, and so promptly too that it would seem this petit lying was the only thing he had ever studied. He had set a day, (yes, fifty days,) to repair his fence, but the briars were so thick he could not get at it until they were cut down, which, if he was spared he would cut down next month. Next month passed away and the briars are still standing, and why? "My neighbor Lunary tells me I had better wait for the dark of the moon in August, and they will then die right out." The moon again and again disappears, and again and again revisits our hemisphere; and a hundred times since has she shone upon our antipodes to our exclusion, and for Thos. Clearfield's benefit, had he availed himself of the time; but the briars are still standing and there they will stand, until the moon shall be everlastingly dark to Uncle Tom. What excuse now? "Why, to tell you the truth of the business, I was so busy about my corn, that to undertake the briars I was afraid I should lose my crop." Whether or not he has that confidence in Lunary which he pretends, is rather a matter of doubt; but be it as it may, Lunary's theory, although not practised by Uncle Tom, (for the best reasons, the time never finding him ready to operate,) is nevertheless regarded by him in the strongest light for excuse making. "Had my potatoes been planted in the dark of the moon in June instead of the light of the moon in May, Lunary says, they would have been as big as pumpkins, whereas as it is, they are no bigger than hickory nuts; and you have no doubt noticed on my farm, some rails bent up like a bow, and a great many rotten ones; Lunary says the bent rails were split in the new moon and the fence was laid in the decrease; which in the first instance accounts for their bending, and in the next, for their rotting."

Last summer, Uncle Tom's neighbors took possession of his blackberry patch, or rather field, and on one occasion, when the multitude had gathered together, he was seen among them with a rather sullen countenance; not because his neighbors were taking his fruit by the wholesale, for he was nowise selfish, and though a lazy dog, he was not

stingy of a little ground." This remark, coming from the source it did, produced a roar of laughter so loud and boisterous, that a large flock of partridges took flight and were flushed from their covert. Uncle Tom was the first to speak, and being encouraged by the success of his last sally of wit, now renewed the onset with a degree of spirit and energy that far surpassed any effort he had ever before made, either mental or physical. "There! he exclaimed, "if it was not for me, of what use would be your guns, your dogs and your nets; you flock here in summer for fruit and in winter for game, to feed the dainty stomachs of your town gentry; and when the creek is low, and the poor fish have no chance to escape, you come down like famished cranes, with your gigs and your seines, and your dip-nets, skin-nets and drag-nets, until you have nearly destroyed the sport of the angler." Scarcely taking time to breathe—for be it known that Uncle Tom was descending on a theme more interesting to him than any other in the affairs of human life, and that he is as fond of angling as ever was Izak Walton, although destitute of his scientific knowledge, for science and skill have as little to do with his fishing as his farming; leaving every thing to chance, his want of success he ascribed to the moon, to the wind or to the weather—scarcely taking time to breathe, he continued—"Twenty years ago, so soon as your minnow touched the water, a twenty inch bass would seize it and you had nothing to do but take him from the hook and cast out another minnow with the same success; but now, since your Muckletonians* have come about, a man may fish all day and go home at night without ever having a nibble." Delivered of this speech, Uncle Tom felt lazy in every bone and muscle and forthwith departed, well satisfied with himself and all the world, except the Muckletonians, leaving his neighbors to enjoy his fruit and to pity the errors of education and the habits of early life which had ruined the usefulness and respectability of a man of naturally good parts, and transformed him into the indolent animal whose cognomen is prefixed to this prefatory chapter of his history. By your leave, Mr Editor, I mean at my leisure, to give several more chapters on Uncle Tom, in which, if I do not conduct him successfully through this world of briars and thorns, I shall at least hand him safely out of it, where I trust, he will be no more annoyed by the impertinent jests of his neighbors, and where, in the quiet and undisturbed enjoyment of his favorite sport of angling, which has been, by some pert coxcomb, described as "the management of a rod with a worm at one end and a fool at the other," he may be securely fenced from the intrusions of the Muckletonians.

BOSTON, WEDNESDAY, AUGUST 28, 1839.

THIRD ANNUAL REPORT OF THE GEOLOGY OF MAINE.
By C. T. JACKSON, M. D. Agricultural Geology, pp. 173, and on.

We have already cursorily noticed this report, which does honor to the learning and industry of its author.—We mean to make some farther remarks upon it, promising, however, that, situated as we necessarily are, we can do nothing like justice to the author, ourselves, or the important subject treated. Constantly changing place, without any authorities for reference other than what an imperfect recollection may supply, snatching an hour when we can get it, writing where we can and as we can, and liable to innumerable interruptions, incompatible with the proper examination of any important subject, we have strong claims upon the candor of our readers, and shall attempt nothing more than to throw out such suggestions for the consideration of the inquisitive as have occurred in the hasty perusal of this report.

The author of this report may be assured, likewise that by none are his labors more highly appreciated than by ourselves; and if we fail to be convinced by his statements, it will be certainly from no want of personal respect for his authority, but simply because he has not made out his case—because of the deficiency of proof in the matter which he labors most.

Geology and Chemistry have yet to perform important services for agriculture. Yet long experience and observation in all matters of physical science, compel us to moderate our expectations of any extraordinary and sudden results. The chemical analysis of soils will help us to approach the knowledge of the methods by which they may be improved, their particular deficiencies supplied, and their superfluous redundance of certain ingredients corrected; but in the present state of science, it will do little more than help us to approach this knowledge. It is one thing to determine by chemical analysis the particular ingredients in certain soils, and quite another to ascertain their particular mode of operation when combined; and under the action of various external influences of air, light, heat, motion, &c. &c., by which they are continually acted upon. The triumphs of chemical science are immense, and may be pronounced magnificent; but compared with what remains to be done, the science even in its improved condition, is merely the first step (*premier pas*) of infancy; it is merely the admission of a few rays of sunlight through a crevice into a subterranean cavern; it is like attempting to sound the middle of the ocean with a skein of thread.

In a late number of the Cultivator, of which we had merely an accidental glance, the learned editor is pleased to say that he hopes the time will soon come when the science of vegetable food and digestion will be understood as well as the science of animal digestion. We quote from memory merely, what we understand to be the sense, not the words. Now we say that that time has already arrived. We understand vegetable digestion as well as we understand animal digestion; that is, we do not understand either of them at all. We beg leave fully to explain what we mean. The physiology of man and of vegetable substances is a highly improved

science. Much has been ascertained; and the labors of many distinguished anatomists and botanists have thrown a flood of light upon it. But there are secrets in respect to it which human sagacity seems as incapable of penetrating, as the human eye is incapable of looking through a block of granite. The experiments and observations of Dr Beaumont, who was favored with such rare opportunities of looking into the human stomach, and observing the action of the juices or fluids of the stomach upon the substances taken into it, are exceedingly curious and instructive, and of great practical utility. But, after all, the secret is not reached; the secret of digestion and nutrition is not even approached, nor even become matter of rational conjecture. The food taken into the stomach is dissolved by the operation of the gastric juice upon it; some in shorter, some in longer time: an effervescence occurs; a solution and separation of particles takes place; but this is a small part of the process. But as to the remaining steps by which it is converted into blood, flesh, bone, sinews, hair, nails, &c. &c., and by which life itself is sustained, where is the human mind capable of producing even a plausible conjecture? The science of vegetation is reached to this same extent and no farther. When man is able by any conceivable artificial process to form one drop of blood, to compact one ounce of bone, or to frame or to color a single flower or leaf, then and not until then shall we say that the processes of animal and vegetable digestion are understood. It is the same with other branches of science. The immense discovery of Newton, the noblest triumph of philosophy—next in our humble opinion, (ridiculous as it may seem to any,) to the discoveries of Phenology, of the great principle of gravitation, is comparatively a very small advance in science. That this principle prevails throughout the material creation as far as it comes under human observation; that it operates with a force proportioned to the quantity of matter contained in the bodies attracted, and to the squares of the distances which divide them; and that in the planetary system its effects are counteracted by another and opposite impelling power, are matters of perfect demonstration and of the most exact calculation even to portions of a second of time; but after all, in what this force consists, and how it operates, so that an atom of matter on earth has its proportionate share of influence upon the remotest bodies in the great system of the material universe, are matters utterly irreconcilable by man's intellect, and the solution of which the giant mind of Newton was as incapable of solving as that of the infant child.

This barrier to the progress of knowledge, however, which now seems impenetrable and impassable, should not discourage us, nor deter us from persevering and indefatigable attempts to go farther. We may advance slowly, but every advance gives the power of going farther; and every gain in physical science, however small, is a great gain to man's improvement and comfort.—The practical arts of life have made immense progress under the improvements of chemical science. Agriculture has already been a great gainer. The careful analysis of soils may presently lead to the most direct modes of improving them. But what we are chiefly in danger of is, of arriving at general conclusions too hastily and holding them too confidently. Every thing therefore, the demonstration of which is not incontrovertibly established, (and there are not many things of this description,) should be regarded as open to further inquiry; and especially under the light which actual experiment may throw upon it.

We know that the intelligent and inquisitive mind of Dr Jackson will acquiesce in these views; and therefore we shall compare in another number the facts which

he has given in respect to the necessity and utility of the carbonate of lime in soils, in order to raise grain crops, with his own theories on this subject. He has distinctly stated (page 123) that "an imperfect or blighted product is sure to follow the planting of this grain (wheat) upon soils destitute of lime; while certain districts where the soil contains this mineral, are always favored with luxuriant and heavy crops. This is one of the settled points in agriculture."

Now we frankly avow ourselves favorably inclined to this belief, somewhat modified however in the universality of its application. Further we have no theory to establish on the subject. But we shall examine hereafter how far the facts accumulated in the report support this position.

H. C.

SALT HAY.

The tide fields of the maritime parts of the State, that is the salt marshes, are now covered with laborers busily occupied in securing their crops, which come for taking. Whatever improvements may be effected upon these grounds, it cannot be denied that scarcely any are attempted; and large tracts of them remain precisely in the condition in which they have been since the settlement of the country. It is not so however universally. The only improvement which they seem to admit of, while they are continued in salt marsh, is that of draining. This is done generally at a distance of two rods apart; the ditches, if made three feet wide at first, will soon become by the settling of the meadow contracted to a small space, and the effect of this draining is, first, the consolidation of the whole meadow; and next, the speedy removal of the tide, which, where it is suffered to stand as it will in hollow places on meadows not drained, destroys the grass. Where these hollows have become deep, it is advisable to fill them with the materials thrown out of the ditches. Where this is not the case, these materials may be carried into the barn-yard or styes, and will form a valuable part of the compost heap. The effect of this drainage, where it has been well executed, has been to double, in some instances to quadruple the crop. It is not however in all cases equally advisable. Where the soil of the marsh is not deep, as near the margin of salt meadows, and by ditching the hard subsoil, whether of sand or gravel or clay, is soon reached, this drainage is not perhaps advisable; at least some experiments render its utility doubtful. But where the mud is deep and the subsoil is not reached by a ditch of three feet in depth, the drainage cannot be too thorough.

H. C.

SALT FOR KILLING WHITE WEED.—When the white weed has not become too plenty upon the farm it can be eradicated and its spread prevented by a little care and attention, and "an ounce of prevention is worth a pound of cure." Many who have small patches upon their farms dig up all they can find, but still some of the roots are left and spring up the next summer to the no small annoyance of the farmer who supposed that he had rid himself of the pest. Mr L. Whitman, of this town, informs us that he followed the plan of digging until he was tired of it, for there would always some of the roots escape and show themselves the next year in spite of him. He then prepared a strong solution of salt in water, and poured it upon spots infested with the white weed. This effected a cure. If you have any of this weed beginning to show itself on your premises, pickle it down.—*Maine Farmer.*

ERRATUM.—In Mr Duroy's communication on "Beet Sugar Manufacture," page 54, 2d column, 17 lines from bottom, for "except a gum or mucilage," read, exempt from gum or mucilage.

*We say accidental, for we are so unfortunate that we cannot get this paper for love or money; we do not know whether through the fault of the Post Office or what. We should be bappy to pay a double subscription, if that would bring it

H. C.

BRIGHTON MARKET.—MONDAY, August 26, 1839.

Reported for the New England Farmer

At Market, 390 Beef Cattle, 70 Stores, 20 Cows and Calves, 4000 Sheep, and 350 Swine. About 100 Beef Cattle unsold.

Prices.—*Beef Cattle*.—Prices have declined, and we reduce our quotations. First quality, \$8 25 a \$8 50. Second quality, \$7 50 a \$8 00. Third quality, \$6 50 a \$7 00.

Stores.—We omit prices.

Cows and Calves.—We notice sales at \$30, \$38, \$45, \$46, and \$60.

Sheep.—About the usual prices were obtained. We quote lots at \$2 25, \$2 50, \$3 00, \$3 50, and \$3 75.

Swine.—Sales were quite dull, at the prices obtained last week. Several lots were sold at 6 for sows and 7 for barrows. One lot, nearly all barrows, 6 1-2. At retail 8 for sows and 9 for barrows.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending August 25.

August, 1839.	5 A.M.	12 M.	7 P.M.	Wind.
Monday,	19	56	84	72 E.
Tuesday,	20	63	86	74 S. E.
Wednesday,	21	64	87	76 W.
Thursday,	22	66	87	74 S. W.
Friday,	23	68	90	75 S.
Saturday,	24	70	85	73 E.
Sunday,	25	68	84	74 N. W.

Hale's Patent Horse Power and Patent Threshing Machine.

JOSEPH BRECK & CO. offer for sale this valuable machine and feel great confidence in recommending it as the best machine now in use. It will thresh from 75 to 100 bushels per day in the best possible manner. The horse power is calculated to propel any kind of machinery, is very simple in its construction, occupies but the small space of nine feet by two, and can easily be transported from one place to another, and when combined with the Threshing Machine it forms the most superior article for the purpose ever invented. They can be supplied at short notice at the N. E. Agricultural Warehouse and Seed Store.

MECHANICS' FAIR.

AT QUINCY HALL, BOSTON, SEPTEMBER 23, 1839.

The public are reminded that the Second Exhibition of the Massachusetts Charitable Mechanic Association, for the encouragement of Manufacturers and the Mechanic Arts, will be opened in Quincy Hall, on Monday, September 23, 1839.

Mechanics, Artisans, and Manufacturers, who intend to offer articles for Premium or Exhibition, are particularly requested to give notice to the Secretary or Superintendent, at as early a day as convenient, specifying the articles intended to be offered.

Contributors are also reminded that all articles intended for Exhibition must be delivered to the Superintendent, WILLIAM WASHBURN, at Quincy Hall, on or previous to WEDNESDAY, September 18, accompanied by an invoice, and a particular description of all new and important inventions, or improvements in the articles offered.

Steam Power will be furnished to put in operation all Machinery, and the Superintendent will take particular charge of all Models offered for this purpose.

Competent Judges will be selected to view all articles presented. Premiums will be awarded to those deemed most worthy of that distinction.

Articles may be offered by Apprentices, who will have a division specially appropriated for their productions.

Tickets of admission will be furnished to all contributors by GEO. DARRACOTT, President.

J. G. ROGERS, Secretary.

WM. WASHBURN, Superintendent.

August 23.

New York Urate and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are not divided among the Stockholders, as are those belonging to another establishment, but sold, to applicants, for cash on delivery. Orders are supplied in the order of time in which they are received. Urate 50 cents and Poudrette 40 cents per bushel, with contingent charges for bags or barrels, &c.

The company are daily preparing for use, during the warm, dry weather, the materials collected during the past winter, and will have several thousand bushels ready before the first of October next. The material is disintegrated and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1838 and 1839, on Long Island, has satisfied many of the farmers that these manures have the *quickest* operation upon vegetable matter, producing *greater abundance*, and the *cheapest* of any manure they have ever tried.

Amended instructions for their use, the result of practical experience, will be furnished on application. The effect of Poudrette upon *Grape Vines* and *Morus Multicaulis* is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manures, and farmers and gardeners may confidently rely on a supply. Orders, and all directions, to "The New York Urate and Poudrette Company," Box No. 1211, Post Office, New York, or sent to the store of STILLWELL & DEY, No. 365 Fulton Street, Brooklyn, will be attended to.

The Company will be very much obliged to gentlemen who have used the manures, to give them a statement in writing what has been the result of their use and experiments in relation to them.

New York, August, 1839.

AGRICULTURAL AGENCY.

The subscriber having been removed from the Post Office, by the pleasure of the President, and left for the present without any means of support, has consented to resume the editing of the American Farmer, which he originally established, and the first periodical in America dedicated to the cause of Agriculture.—That resource, though "better than nothing," being altogether inadequate, as an additional

THE RATTLESNAKE.

This snake is peculiar, we believe, to North America, and was formerly found in great abundance in New England—but since the country has become settled, and an exterminating war declared against these noxious reptiles, their numbers have rapidly decreased, and now they are seldom seen. They are still to be found, however, occasionally, we believe, in certain parts of every New England State, but generally confine themselves to rocky ledges in uncultivated tracks of the country. In Chester, N. H., there is a hill, which, from the great number of these reptiles which formerly made it their abiding place, is called Rattlesnake Hill. A few still remain—and they are sometimes killed in the adjoining towns, where they wander in search of water.

A number of years have passed away since an occurrence took place in the neighborhood of Chester, which caused considerable excitement in the neighboring families at the time, and which is still worth relating. Some men were employed in mowing a meadow, which was at a distance from any dwelling or road—and as the weather was sultry and many parts of the meadow covered with water, one of them, Mr. R., thought proper to divest himself of nearly all his garments, and led the van of the mowers, *sans culotte!* It is well known that at this season, when drought generally prevails, rattlesnakes are very apt to come down from the high lands in quest of water—and as Mr. R. got at the end of his swath, and stepped on the dry land, he placed his foot almost in contact with a huge rattlesnake, which raised its tail, gave it a few quick and sharp shakes, and sprung at the poor man just as he turned to flee, half frightened to death from the venomous reptile! His crooked, poisonous fangs entered the lower part of the only garment which Mr. R. wore at the time—the texture of which was particularly strong, and they could not be easily disengaged. Mr. R. gave a scream and started off on the full run, the snake sticking to him closer than a brother. He passed through woods, bushes, fields and pastures—he crossed fences, ditches, brooks and logs—he jumped, hallooed, galloped, and screamed for aid—vainly trying to rid himself of his ugly-looking associate. At length, crazy with fear and fatigue, he reached the public road, and passed along it on the way to his dwelling house, at a rate which would have astonished the most desperate pedestrian—looking behind him at intervals, and screaming whenever he beheld the horrid appendage to his homespun linen garment. He passed several persons in the road, who were thunderstruck at the sight of the unfortunate man cutting up such antics, using such violent exercise—and exhibiting himself in dishabille, without regard to propriety or decency. Mr. R. at length reached his own dwelling, a distance of three miles from the meadow—the door of which stood invitingly open, through which he rushed to the consternation of the women folks—having still attached to him the grim looking reptile. By this time he was completely overcome with terror, heat, and fatigue, and fell fainting on the floor. The poor rattlesnake, however, had got the worst of it, and had been threshed about at such an unmerciful rate, that his life, as well as a large portion of his tail, had departed, long before he reached the goal!

In the wild hills and trap ledges of Manchester,

Saugus, and Lynn, in this State, this reptile is still seen and sometimes killed of a size measuring five and six feet in length. It is also found among the hills in some portions of the interior—especially on Mount Tom and Mount Holyoke on the banks of the Connecticut.

In some parts of the western country the rattlesnakes abound, and grow to the size of six or seven feet. Hunters, or persons who have occasion to explore the woods, glens, and uncultivated spots, wear leggins, made of stout deer skins, to protect their legs against the bite of this venomous animal, as they seldom strike their enemy at a point higher than the calf of the leg. When a party of hunters or travellers find it necessary to encamp at night, they select a suitable spot, examine it thoroughly, that there are no holes or rocks about it, which may serve as abiding places to venomous reptiles, and then draw around them at a proper distance, a stout rope manufactured of horse hair, thus describing a sort of magic circle, in which the members of the party enter, throw themselves on the ground, and repose without any fear of intruders in the shape of snakes—as it is a singular fact that these creatures will never crawl over a rope made of horse hair! It is not uncommon to find on awaking from their slumbers in the morning, several of these unwelcome visitors handsomely coiled up at the distance of a few yards from the circle!

In the wild and mountainous region which separates Virginia from Kentucky, rattlesnakes are found in immense numbers—indeed, great precautions are necessary in travelling among these ledges, lest the traveller receives a fatal wound. In the latter part of September they may be seen crawling up by hundreds from the low lands, in search of winter quarters, and congregating by thousands in various spots, where they may be seen by whoever wishes to indulge in such a curiosity, sunning themselves on the precipices. This tract is also the favorite abode of the catamount, the panther of North America.

Rattlesnakes are also found in great abundance to the westward of the Rocky mountains. Cox, in his adventures on Columbia river, says, “these venomous reptiles are so numerous near the Grande Rapido, that they are seen in immense numbers basking in the sun, and crawling among the rocks. At one time, half a dozen of the party fired at a bunch lying under one rock, and killed and wounded thirty-seven.”

In the western part of Michigan, and in the Wisconsin Territory, a species of rattlesnake abounds, which is smaller than the ordinary yellow rattlesnake, and of a hue almost approaching to black. They are very venomous. In some places on the banks of the Wisconsin, the numbers of these reptiles have decreased astonishingly since hogs have been introduced by the settlers. Swine declare war against them, never ending war, and hunt them for the sake of their carcases, which they consider a great delicacy. And what is singular, the bite of the snake seems to have no injurious effect on the hog—who never hesitates about attacking one of the largest size. He seizes the reptile by the middle with his teeth, and mangle all his writhings, and hisses, and bites, soon tears him to pieces, and devours him with all the apparent relish of an epicure!

The largest rattlesnake of which we have any authentic intelligence, was one killed some years since on the shores of Apalachicola Bay, in Florida,

which measured nine feet six inches in length and had twenty-one rattles! He was a real old bruiser, with long and crooked fangs like a man's finger. A wound inflicted by such an animal must be very inconvenient, to say the least.—*Bost. Merc. Jour.*

The largest library in the country is the “Philadelphia Library,” established by Franklin.—It contains about 50,000 volumes. Respectable strangers are permitted to use the books during the hours at which it is open, a privilege which may be improved to advantage, since there are many rare and valuable manuscripts connected with the times of the Revolution to be found here preserved. The second library in size is that of Harvard University, near Boston—containing about 40,000 volumes.

In Germantown the leaves of the mulberry are made into delicious pies! in another place they are dried as a substitute for Young Hyson tea! and it is said that a down-easter is making paper of them!

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. One man and horse with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street. July 10.

N. E. FARMER.

MR. WEBSTER'S SPEECH.

We give in the Farmer of this week the speech of our distinguished senator, Mr Webster, at the tricennial National Agricultural Convention of England. It is sensible, condensed, and strictly appropriate. The report of it is undoubtedly imperfect; but it is characteristic of this eminent man that he uses language always with great precision, and employs no needless circumlocutions or repetitions; that what he says is always intelligible to the most common and uneducated mind; that he says what he evidently designed to say; and that which is always worth saying and worth hearing.

The compliment which he pays to British Agriculture is particularly worthy of remark. "The agriculture of England was instructive to all the world; as a science it was here better understood; as an art it was here better practised; and as a great interest it was here as highly esteemed as in any other part of the globe."

We presume this compliment is well deserved. Yet we believe it should be in a measure qualified. In productiveness of cultivation, that is to say, in getting the greatest amount of product from the smallest quantity of land, we suppose that the Flemish are preeminent above all other people. In scientific agriculture, in the application of chemistry to the cultivation of the earth, and in experiments upon various manures, we suppose the French are far in advance of England. In devotion to agriculture as a means of subsistence, and in the amount of population sustained by agriculture, and perhaps in the amount of labor bestowed upon the soil, and in the frugal and exact saving and use of manures, we presume the Chinese surpass all other nations on the globe. In the improvement of live stock, in the breed of horses, cattle, sheep, and wine, we suppose no country can come in competition with Great Britain. And especially in the estimation in which this great interest is held and cherished in this intelligent, cultivated and mighty empire, she stands far in advance of all others, and gives a most instructive lesson to the world. The extraordinary fact, however, that France has, within a comparatively short period, increased her annual product of beet sugar, under the protec-

we confess our fears that we shall fall short of, are stronger than our hopes that we shall reach it.

Our cane-sugar, cotton, and tobacco crops are to be sure, enormous, and admit of no competition in countries whose northern latitudes forbid their cultivation, with the exception of the latter crop, tobacco, which of a certain and superior description, is now cultivated with great success and profit in Upper Canada. But in regard to the products common to us and the northern nations of Europe, the cereal grains in particular, we may well be ashamed of ourselves, while with a soil and climate offering every advantage for their most successful cultivation, we can acquiesce in the degrading necessity of importing wheat, oats, rye, potatoes, and even hay from Europe.

We are very far, however, from desiring to be brought under a system of tariff protection in regard to our agricultural products like that which prevails in England. The agriculture of England is burdened with governmental impositions and burdens, which have most injuriously affected its prosperity, and rendered the price of bread enormous, and crowded their almshouses with paupers and their prisons with wretched convicts. The corn laws are now agitating the whole kingdom to its centre; and the singular anomaly is presented in the richest and most fertile part of the British kingdom, of a people driven to desperation by poverty and starvation. The farmers of this country should ask little else of government than to be let alone. With no taxes which deserve to be named, with a climate eminent for its salubrity, with a soil which never refuses an ample return to skill, industry, temperance, and frugality, with a ready market for every production of agricultural labor, with the ample experience of other and the most improved countries to instruct them, and with intelligence and general education sufficient to enable them to avail themselves of every lesson, facility, and advantage for agricultural improvement and success, if they do not excel, if they (we speak particularly of the northern and middle States,) still submit to buy their bread, and, through extravagance of every description, will go on to involve themselves in a debt to other countries, which must presently become irredeemable, why then there is room for nothing but shame; the curse of heaven will bring us

he hoped might often be seen again. Among these foreigners was one gentleman of a most distinguished character from the United States of America— [cheers]—that great country, whose people we were obliged legally to call foreigners, but who were still our brethren in blood. [Loud cheers.]

It was most gratifying to him that such a man had been present at that meeting, that he might know what the farmers of England really were, and be able to report to his fellow citizens the manner in which they were united, from every class, in promoting their peaceful and most important objects. He gave, "The health of Mr Webster, and other distinguished strangers." The toast was received with much applause.

Mr Webster said the notice which the noble Earl at the head of the table had been kind enough to take of him, and the friendly sentiments which he had seen fit to express towards the country to which he belonged, demanded his most cordial acknowledgments. He should therefore begin by saying how gratified he had been in having it in his power to pass one day among the proprietors, the cultivators, the farmers of old England; [cheers]—that England of which he had been reading and conversing all his life, and now for once had the pleasure of visiting. [Loud cheers.]

He would say, in the next place, if he could say, how much he had been pleased and gratified with the exhibition of one product, or branch of product, of that agriculture for which England was so justly distinguished. When persons connected with some pursuit, of whatever description, assembled in such numbers, he could not but look on them with respect and regard; but he confessed at once that he was more than ordinarily moved on all such occasions, when he saw before him a great assemblage of those whose interests, whose hopes, whose objects and pursuits were connected on either continent with the cultivation of the soil. [Loud cheers.]

Whatever else might tend to enrich and beautify society, that which feeds and clothes comfortably the great mass of mankind should always, he contended, be regarded as the great foundation of national interest. He need not say that the agriculture of England was instructive to all the world; as a science it was here better understood; as an art it was here better practised; and as a great in-

enable them to dispose profitably of their own surplus; but the fact went much farther, for when there was such an occurrence in the English capital, the centre of commercial speculations for the whole world, where the price of commodities was settled and arranged, where the exchanges between nations were conducted and concluded, its consequences were felt every where, as none knew better than the noble Earl who occupied the chair.

Should there be a frost in England fifteen days later than usual—should there be an unseasonable drought, or ten cold and wet days instead of ten warm and dry ones, when the harvest should be reaped, every exchange in Europe and America felt the consequence of it. He would not pursue these remarks. [Loud cries of "Go on, go on."] He must, however, say, that he entertained not the slightest doubt of the great advantage to the interests of agriculture which must result from the formation and operation of this society.

Was it not obvious to the most common observer that those who cultivated the soil had not the same conveniences, opportunities and facilities of daily intercourse and comparison of opinions as the commercial and manufacturing interests?— [Cheers.] Those who are associated in the pursuits of commerce and manufactures naturally congregated together in cities; they had immediate means of frequent communication. Their sympathies, feelings and opinions were instantaneously circulated like electricity through the whole body.

But how was it with the cultivators of the soil? Separated, spread over a thousand fields, each attentive to his own acres, they had only occasional opportunities of communicating with each other.— If among commercial men, chambers of commerce and other institutions of that character; if among the traders, guilds were found expedient, how much more necessary and advisable to have some such institutions which at least annually should bring together the representatives of the great agricultural interests? [Cheers.]

In many parts of the country to which he belonged, there were societies upon a similar principle, which had been found very advantageous. They had rewards for specimens of fine animals; they had rewards for implements of husbandry, supposed to excel those which had been known before. They turned their attention to every thing supposed to facilitate the operations of the farmer, and improve his stock and interest in the country. Among other means of improving agriculture, they had imported largely from the best breeds of animals known in England. [Cheers.]

He knew that a gentleman who had to-day deservedly obtained many prizes for stock, would not be displeased to learn that he had seen along the rich pastures of the Ohio and its tributary streams, animals raised from those which had been furnished by his farms in Yorkshire and Northumberland. [Cheers.] But, apart from this subject he must be allowed to make a short response to the very kind sentiments which went near to his heart, as uttered by the noble earl at the head of the table.

Their noble chairman was pleased to speak of the people of the United States as kindred in blood with the people of England. [Cheers.] "I," continued the honorable gentleman, "am an American. [Cheers.] I was born on that great continent, and I am wedded to the fortunes of my country for weal or for woe. [Loud cheers.] There is no other region of the earth which I can call my country.— [Cheers.] But I know, and I am proud to know, what blood flows in these veins. [Cheers.]

I am happy to stand here to-day and to remember, although my ancestors for several generations lie buried beneath the soil of the Western continent, yet there has been a time when my ancestors and your ancestors toiled in the same cities and villages—[cheers]—cultivated adjacent fields—[cheers]—and worked together to build up that great structure of civil polity which has made England what England is. [Cheers.]

When I was about to embark, some friends asked me what I was going to England for. To be sure, gentlemen, I came for no object of business, public or private; but I told them I was coming to see the elder branch of the family. [Loud cheers.] I told them I was coming to see my distant relations—[cheers]—my kith and kin of the old Saxon race. [Loud cheers.]

With regard to whatsoever is important to the peace of the world, its prosperity, the progress of knowledge and of just opinions, the diffusion of the sacred light of christianity—[loud cheers]—I know nothing more important to the promotion of those best interests of humanity and the cause of the general peace, amity, and concord, than the good feeling subsisting between the Englishmen on this side of the Atlantic and the descendants of Englishmen on the other. [Cheers.]

Some little clouds have overhung our horizon—I trust they will soon pass away. I am sure that the age we live in does not expect that England and America are to have controversies carried to the extreme upon any occasion not of the last importance to national interests and honor. [Cheers.]

We live in an age when nations as well as individuals are subject to a moral responsibility.— [Cheers.] Neither government nor people—thank God for it—can now trifle with the general sense of the civilized world, [cheers]—and I am sure that the civilized world would hold your country and my country to a very strict account, if, without very plain and apparent reason, deeply affecting the independence and great interests of the nation, any controversy between them should have other than an amicable issue. [Cheers.]

I will venture to say that each country has intelligence enough to understand all that belongs to its just rights, and is not deficient in means to maintain them, [cheers] and if any controversy between England and America were to be pushed to the extreme of force, neither party would or could have any signal advantage over the other, except what it could find in the justness of its cause and the approbation of the world. [Loud cheers.]

With respect to the occasion which has called us together, I beg to repeat the gratification which I have felt in passing a day among such a company, and conclude with the most fervent expression of my wish for the prosperity and usefulness of the Agricultural Society of England. [Loud cheers.]

Benefactors of the world.—The man who turns a weedy desert into a fertile garden—an idle stream of water into an instrument of industry and profit—who can press the idle winds into his employment and make them productive—who can make the steaming exhalation of boiling water move ships through the ocean against wind and tide—who can, with the same simple power, make ten thousand wheels revolve which a million of men could not move, and with almost magic aid convert our flax into fine cloth, and extract from the centre of the mountains their richest ores—these are the men who are the benefactors of the world.—*Yankee Farmer.*

[For the New England Farmer.]

J. BRECK, ESQ.—Dear Sir—In compliance with your request I cheerfully devote a few moments to giving you an account of a piggyery. I will premise by the way, that the writer of an article which appeared some months since in the *Yankee Farmer*, and which I regret should have found its way into many other papers, has greatly exaggerated the profits of my establishment. I have often stated and now repeat, that the manure from my hog pens will pay for all the food which I purchase for them: the residue of their feed, by far the greater part, being the produce of my own farm.

When the average price of corn is one dollar per bushel and potatoes 53 cents, and pork will bring 12-13 cents per pound, I have no hesitation in saying that there is a handsome profit in raising pork for the market, provided the hogs be of the best breeds. With such breeds I have always found that four quarts of Indian or barley meal, with an equal quantity of apples, pumpkins, potatoes or other roots well cooked, will give two pounds of pork. At this rate it will be perceived that there is a profit on the pork at the above price, exclusive of the manure the hogs make, which is of great value to the farmer, but by no means equal to the whole nor even half the expense of feeding.

My breeds are principally of the Berkshire full bloods and a cross of this breed with the Mackey breed. This cross I have found decidedly preferable to the full bloods of either. I have an important sow of the "Essex half blacks," being a descendant of the Berkshire, and highly spoken of by English breeders. The Mackey pigs were imported into this country from England some 15 or 20 years ago, by Capt. Mackey, of Boston, and till within a few years were decidedly the best stock in New England, and perhaps in America. When first imported, Capt. Mackey, on his farm at Weston, not infrequently brought them up to 600 lbs. at the age of 18 months. In all the essential points, such as maturing early, lightness of offal, greater weight in the more profitable parts, thinness of skin, &c., they greatly exceeded the Berkshire breed. But by breeding in *antia* as it is termed, they had greatly degenerated, had become weak and feeble in constitution, small in size, ill-slaped, and in some instances deformed. With the exception of the human species, no animal degenerates so rapidly by this practice of breeding in and in as the hog. Judicious crossing is the only way by which a good breed of swine can be kept up and preserved. By proper attention to this principle, all good and valuable qualities of a breed may be preserved and the bad rejected—without it the best breeds will soon become worthless. With a view of restoring some of the good properties of the Mackey, I tried crossing them with various breeds, and with none have succeeded so well as with the Berkshire. The produce of this cross possesses all the good and valuable points of the Mackey united to the health, vigor and size without any of the coarseness of the Berkshire. The best pigs, however, that I have ever raised, and I can say without hesitation, the best I have ever seen, were produced by putting a full blood Berkshire boar to a "Moco," which was a cross of the Mackey with the "Moco," a New York breed, the progeny being half Berkshire, a quarter Mackey, and quarter Moco.

My stock of fattening swine usually consists of about one hundred, besides about fifty stores. My time for slaughtering is in February and March,

when half my pigs are at the age of 15 and 16 months, being the fall and winter litters of the previous year, the other half being the pigs of the spring next previous to killing, and are at the age of 9 and 10 months. The former in years past have weighed from 350 to 100 lbs., and in some instances as high as 500 lbs. The latter from 250 to 350 lbs.

An enquiry is often made as to the best time of killing, or at what age it is most profitable to slaughter them. On a large farm where much green herbage is produced and where the value of the manure is taken into the account, I consider the pigs killed at the age of 15 and 16 months as giving the greatest profit. When it is intended to kill them at this age, they may be kept on more ordinary and cheaper food for the first 10 or 12 months or till within 4 or 5 months of the time of killing. The manure they make and the extra weight of pork more than pay the expense incurred in keeping them the longer time; but the spring pigs which are to be killed the ensuing winter and spring, must be kept upon the best of food from the time they are taken from the sow until they are slaughtered.

The older class of pigs for the first 10 or 12 months, are kept principally upon brewers' grains, with a small quantity of Indian or barley meal or rice, ruta baga, sugar beet, &c., and in the season of clover, peas, oats, constalks, weeds, &c., they are cut green and thrown into the pens; the next four or five months before killing they have as much Indian meal, barley meal or rice, with an equal quantity of potatoes, apples or pumpkins as they will eat, the whole being well cooked and salted, and given to them about blood warm. During the season of fattening, an ear or two of hard corn is every day given to each pig. This small quantity they will digest well, and of course there is no waste. Shelled corn soaked in water made as salt as the water of the ocean, for 48 hours, with a quart of wood ashes added to each bushel and given to them occasionally in small quantities, greatly promotes their health and growth. Their health and appetite is also greatly promoted by throwing a handful of charcoal once or twice a week into each of their pens. Their principal food should, however, be cooked as thoroughly and as nicely as if intended for table use. From long practice and repeated experiments, I am convinced that two dollars worth of material well cooked will make as much pork as three dollars worth of the same material given in a raw state.

Pigs when first taken from the sow should be treated with great care, to prevent scouring and from becoming stunted; when either of these happen, it will require many days and sometimes weeks

food, but kept in a healthy, growing condition, till within four or five months of the time of killing, when they were fed as high as the others. They were all slaughtered at the same time, being then 16 months old. At the age of 9 months the fall fed pigs were much the heaviest, but at the time of killing, the pigs fed sparingly for the first 10 or 12 months weighed, upon an average, fifty pounds each more than the others. Besides this additional weight of pork, the three "lean kind" added much more than the others to my manure heap.— These results would seem very obvious to any one who has noticed the habits of the animal. In consequence of short feeding they were much more active and industrious in the manufacture of compost, and this activity at the same time caused the muscles to enlarge and the frame to spread, while the very fat pigs became inactive, and like indolent bipeds, they neither worked for their own benefit nor for that of others.

For the purpose of increasing my manure heap, my pens are kept constantly supplied with peat or swamp mud, about three hundred loads of which are annually thrown into my styes. This, with the manure from my horse stable, which is daily thrown in, and the weeds and coarse herbage which are gathered from the farm, give me about 500 cart loads of manure in a year.

On regular and systematic feeding and clean and dry bedding, the success of raising and fattening swine very much depends. A faithful feeder, also, who has some skill and taste, and withal a little pride of vocation, is indispensable. Homer informs us that much of the success of Ulysses in rearing his fine hogs, was to be attributed to his faithful Umeus, whom the old soldier syled (*διδως σφωτατης*) godlike swinefeeder.

The annexed is a rough plan, which may serve to give you an idea of the compact manner in which my hogs are kept. It is intended for a plan of the upper story and one end. The lower story corresponds with the upper, except that the promenade is extended out about six feet from the line of the upper outside promenade line.

END VIEW.

The roof covers the passage way and eating and sleeping apartments on each side, and made sufficiently high to enable the feeder to pass between the pens. The floors of the eating and sleeping apartments are made perfectly tight—the floor of the promenade in the upper story is laid with narrow plank, placed about one inch apart, so that whatever is dropped by the pigs, falls through on the compost beneath. The promenade of the lower story has no floor. The only passage for passing the pigs out and in, is by a slide door between each dormitory and the main passage way. The pen being on ground which is a little higher at the end where the boilers are placed than at the other, the floor of the boiler room is on a level with the passage way of the upper story, where the pigs kept in this part of the building are taken in and out. At the other end of the building, the floor of the passage way in the lower story is on a level with the natural surface of the ground, and by a door at that end of the passage way, the hogs in the lower story are taken in and out. You will perceive that a pen 100 feet long and 34 wide, with 3 in a pen, will furnish ample accommodations for 120 hogs. A passage way for the feeder is made from the cooking room to the passage way in the lower story.

Very respectfully yours,

E. PHINNEY.

For the N. E. Farmer.

MR BRECK—I hope you will continue your "Notices of Farms—Minutes by the Way, &c.;" it is just what we need—shows us things as they are. If farmers will not or cannot find time to tell one another what they are doing for the advancement of agriculture, some one should for them; for from the practice of all, something can be learnt: we should hear of the success and failures of different individuals, that we may profit by the one and avoid the other. You need not fear of speaking too plain—we need the experience of one another.— We often hear farmers say "they cannot afford to do this or that way"—this word *afford* has troubled me exceedingly. I do not understand it, in the connexion it is so often used. In your account of

THE SILK BUSINESS—ITS AGENTS—ODD TIMES, &c.

To the Editor of the Farmer's Cabinet:

Sir—I know not whether it is permitted to the female portion of your readers to address you in your professional capacity, but if it be not incompatible with decorum, I feel a desire to say a word or two in defence of our rights and privileges as a class, whose laborious and incessant solicitude, demand for us, in my estimation at least, the character of *partners*—as in the trials incidental to the profession of husbandry, so also in the more pleasing and legitimate task of good housewifery. All, however, that I require is, that we be considered by our husbands as *helpmates*, deserving their regard and kind attentions. But to the point.

You must know, that my husband has been engaged in the cultivation of the *morus multicaulis*, with the real intention of growing silk, and more, of manufacturing it from the cocoon; thus proving that he is the one in a thousand who has ever thought seriously of doing, what all pretend to have in serious contemplation. Now I should never have thought of interfering with these pursuits, had it not been for a conversation which passed yesterday at our table, by which it appears that we are to be considered the chief workers in the business, the real *silk worms*! for just at the point when their labor ends, and a short labor, or rather pleasure it has been to them, *ours* is to commence, and be carried through the thread of our existence. Our guest at table was from Philadelphia, and commenced by inquiring, "Well, how comes on the morus? Ah! the making of silk must in the end prove the making of this great country; so admirably calculated for the employment of our redundant population; affording a profitable investment of capital to any extent; enormous profits to all those engaged in the various departments connected with it, from the growing of the trees to the weaving silk dresses for our fair ones, and embroidery for our drawing rooms; and to none more than to the wives and daughters of our farmers; thus affording our women and their children profitable and elegant employment at *odd times*!" At this I looked up, and beheld a youth about seventeen, tall and white, like a pork griskin," as the song says, with hair "*a la turkey*," and scented to the nose—just escaped from that band-box of fashion, a dry goods' store in Market street! My choler rose, the fire kindled, and I at length spake with my tongue—but do not suppose that I said more than a prudent woman should: there was no need of that, for the little creature diminished to the size of a chrysalis, and I could have rolled him into a cocoon! I merely said, "That is kind of you, Mr —, to find employment for your women at *odd times*—the oddest thing I ever heard of—for the *industrious* wives of farmers never have any *odd times*. Besides, I am much mistaken if any good can come of an employment which requires the incessant and all-enduring patience of a whole life, proverbial for wearing out the energies of both body and mind, if it is to be taken up only at *odd times*. You say it is particularly adapted to the family of a farmer occupying a few acres of land! Now in the name of common sense, and in the name of every industrious female in the country, what is meant by this? in a country too which is spreading far and wide her arms, entreating those industrious families who are willing to take up so unhealthily and debasing an employment at *odd times*, to come west, and cultivate

the land and walk upright in the glory of nature! No, no, Mr —, before I submit to fill up my *odd times* in this way, I will carry my husband where he may be able by his industry to enable me and my children to employ our *odd times* in a far more agreeable way—in the improvement of our minds and bodies, leaving the silk business to those countries whose wretched inhabitants (notoriously deformed in body and imbecile in mind, fit subjects for a tyrannical and monarchical government) are compelled to toil for fifteen hours for about as many cents; and with all this misery and starvation, you see they cannot afford to sell the articles, which they fabricate at such a sacrifice of body and mind, for less than the price which they command in the market at the present time. You seem, too, to have alighted upon *odd times*, for you see the import duty on silk is taken off. I know that you all rely upon the enormous bounty which the States are giving for the production of these articles of doubtful good, but I can only say I am mistaken if these encouragements to speculation will remain in operation for six months longer; and when the excitement has passed away, these States will view this piece of legislation as about the height of the morus folly."

After the young man had taken his leave, which he scarcely waited to do, I learnt that he was a stripling from one of the wholesale dry goods' stores in Market street, endeavoring to form "A Joint Stock Trading Morus Multicaulis Company," with a capital of about five hundred thousand dollars, the directors of which were to have the privilege of buying and selling their stock, of both kinds I presume, at whatever prices they might deem most advantageous to the good of the company. The president and other officers had all been chosen, to whom liberal salaries had been appropriated, and this young worthy, so anxious to find employment for his women at *odd times*, is to figure as treasurer!

JANET JENKINSON.

Witch Grass.—A writer in the Maine Farmer states from experience, one of the easiest and most profitable means of destroying this grass, which is as follows:—"My father once took a piece which was thickly set with it, ploughed it late in June, sowed it with winter rye, and turned it into his sheep pasture. The rye continued to come up for a year or two, and was kept closely fed by the sheep, and in a few years the witch grass was exchanged for sweet clover and red top. I doubt not but that this plan might be adopted to advantage on many farms that are over-run with this useless weed. It is folly to talk of digging it up when it has obtained a firm foot-hold. Land that is of a light thin soil, can be changed from tillage to pasture to great advantage. Pastures would be improved in this way, for it is bad economy to possess a pasture that will give only now and then a spot that cattle will touch."

Most of the agricultural papers have recently noticed the increase of witch grass, and the means of destroying it have been frequently a topic of discussion. Has it been ascertained that this grass is so noxious and worthless a weed as seems to be generally admitted? It is doubtless a nuisance in the garden, and so are all other grasses. But is its presence among other grasses, for mowing or pasturing, so much to be dreaded? We make the inquiry, at the suggestion of a gardener, presuming that an answer will be forthcoming from some of our more *practical* neighbors.—*Bost. Cour.*

[For the New England Farmer.]

THE EDUCATION OF FARMERS.

Mr. EYTON—I shall trouble you and your readers with but a few more remarks on the subject which forms the caption of the present article. In my last communication I suggested the great importance of the education of farmers' sons *professionally*, in order that a regeneration of our agriculture may be effected. The mind, in early life, is so free from prejudices grown dear through lapse of time, and is so open to impressions and ideas that are presented to it, that it would seem it should be (as it has been in most pursuits, with the exception of the culture of the soil) directed exclusively to the acquisition of knowledge and the formation of opinions, that may be applied practically in after years. In the freshness and vigor of youth, it accumulates ideas with infinitely more rapidity than when, calloused by age, it must store itself with information gathered by exertions wearing to the body as well as itself. To dwell on a fact so well established, would be common-place and trite, and, in its application to almost every other pursuit, it excites our wonder that it has been overlooked and forgotten in rural pursuits. There is no one who stands more in need of an early acquisition of knowledge that may be applied in daily practice of principles that are called into constant use, than the young farmer. When thrown upon his own resources, such knowledge must be his chart and compass, and he might as well hope to navigate the ocean without the latter, as to attempt the culture of the soil with any certainty of success without the former.

Indeed, sir, whatever education touches, it elevates and dignifies. As soon as success in any pursuit is made to depend upon the development of the mind, then is that pursuit respected. And here has been the difficulty with farming. It has, until very recently, been entirely independent of anything intellectual. In other countries it has been left to peasants and serfs, and in our own, those engaged in it have hardened their hands and worn out their bodies, while their brains have lain almost inactive. The idea has gone abroad that the duties of the husbandman and his sphere of action, are necessarily confined to the manual operations of the plough, the harrow, and the flail—fit occupation for those whose ambition does not carry them farther. And hence it has become fashionable, and naturally enough, while the public labor under existing false impressions, for young men to hurry into commerce and the professions, until these avenues are choked with votaries even to their very entrances.

We rejoice to perceive that a more correct view of agricultural pursuits is gaining ground in the community. The spirit of the age is onward, and although at the eleventh hour, husbandry begins to feel the impulse. The public, we believe, are daily becoming disabused of its false estimate of the subject, and there are those, who can see that there is both honor and profit to be found in the use of the spade and the rake. Indeed were it only to fashion the inclinations and correct the tastes of youth, we would urge the early education of young men professionally for farmers. Not only does the agricultural interest demand that the errors and prejudices of centuries should be removed, but it also calls loudly for pioneers who may go forward and break the ground. The public weal is still more urgent for a greater number of hus-

bandmen. Daily events are telling us that the consumers vastly outnumber the producers, and that our citizens are forgetting that our institutions, our soil and climate, mark us out for an agricultural as well as a commercial and manufacturing people, and that we have perverted the operation of those institutions in the fact, that we cannot feed as well as clothe and protect the body of the people.

To raise the character of husbandry, then, and make it a matter of science as well as manual labor, to turn public attention from the already crowded avenues to the professions and commerce, to the more quiet and at the same time, more republican pursuit of agriculture—to correct the false impressions and taste that lead young men into the bustle of more active life, we urge upon our farmers to educate themselves and their sons. To accomplish the former, they may have daily access to the numberless periodicals and substantial works upon the different branches of their profession: they have the inducements and assistance of societies and individuals; and they have the ingenuity and shrewdness for which they are so justly noted, to make the most advantageous application of these. To make scientific farmers of their sons, they have but to be liberal towards them, in the most extended meaning of the term in their early education, and to put them in the way of acquiring such information as they themselves feel the want of. We hope to see the day when facilities for the education of farmers will be afforded in the existence of agricultural schools, where young men may resort to prepare themselves for the culture of the soil on those well established and liberal principles, that can alone raise and support the character and credit of agriculture. We look to their establishment as an era in the farming interest, and we trust that ere long, it can be said, to the credit of Massachusetts, that she has been the first to found these, as she has other institutions for the education of the people; and that it may no longer be asserted that, while she fosters the interests of the arts and commerce, she almost neglects a class of her citizens who constitute a majority of her population, and who are ever watchful of her best welfare and reputation.

H. V.

Greenfield, Aug. 19, 1839.

Daily value of sunshine.—The value of the agricultural products of the United States cannot be less than \$500,000,000 annually. The perfection of this is depending on the weather of four months, June, July, August and September, or about 120 days. Every one knows that without sunshine the crops would be a failure either partially or totally; and hence we can estimate its average value at about five cents per acre per day. *Am. Farmer*, 1839, p. 72.

From the Farmer's Cabinet.

NEW REAPING MACHINE: GREAT SAVING.

On the 4th of July the farmers of this neighborhood enjoyed the pleasure of seeing the Reaping Machine, invented by Mr. O. Hussey, of Baltimore, operate upon a field of wheat. Mr Hussey had been invited to exhibit his machine before the *Society of St. George's and Appoquinimink for the Promotion of Agriculture*, and the 4th of July was named as the day; and true to his appointment, Mr Hussey and his patent reaper made their appearance. Hundreds of farmers were assembled to witness it, and many were the doubts, surmises, and criticisms upon the machine, as it was viewed over and over, as it lay in readiness for trial. Some time after Mr Hussey's arrival, the society was called to order, and the Declaration of Independence was read, while the greatest order and attention prevailed; after which the society adjourned to the dinner table and partook of an excellent dinner, prepared for the occasion. These interesting preliminaries being despatched, and all things being in order, the two strangers (Mr Hussey and his machine,) were duly introduced to a field of standing grain, ripe and ready for the sickle, and in the twinkling of an eye the machine was off, clipping and cutting, and saving the grain in beautiful style. A cleaner and more even stubble could not be produced. All doubts vanished in the minds of the spectators. Every head of wheat was saved, and the machine was drawn with apparent ease by two horses, and cutting at the rate of from twelve to fifteen acres in a day. The machine was forthwith purchased by the society, and reserved for future trial, which has since confirmed them in the good opinion they had of its capabilities. All who have witnessed it express themselves satisfied, and many are intending to provide themselves with machines for the next harvest. Thus, through the influence and exertions of the agricultural society, we may expect next year to see this valuable labor saving and grain saving machine fairly introduced among our farmers. It is a difficult matter to describe the machine so as to convey a proper idea of its structure; I hope, however, that many will be induced to see for themselves, and they may rely upon having all reasonable expectations realized.

Yours, &c.

N.

Wilmington, Del., July 15, 1839.

ACCUMULATION OF MANURE.

Manure is the true source of the cultivator's wealth. Every farmer should tax his wits to the utmost, with a view to the accumulation of this article. He can not afford to neglect it, and must

family makes soap suds and dish water, in with every quart of it. Let none of it go elsewhere. It is an excellent plan to consult the road side for rich soil and low places for boggy substances, which have been washed down from elevated grounds. Cart this home as so much grain, and let your hogs saturate it with urine. Every load of it will come out next spring so much excellent manure. Go out too, half a dozen times in the course of the summer, with a stout scythe, and mow down all thistles before they have blossomed or gone to seed—cut up brakes at a great rate and all unnecessary bushes. Then take your hay cart and load up. Bring the collection home and pile it up outside the yard. Every little while throw a lot of this over to the swine. If you occasionally scatter a little corn or oats in the mass, it will do the hogs no harm to roat after it, and will do the collection good by producing fermentation. A great many loads of the most valuable manure may be made every year by some care and attention of this sort.

Bar yards, also, should be constructed on principles similar to those which we have mentioned for the manufacture of manure by swine. These must, we suppose, be in the open air, whereby much of the gases will escape; still the deposit of much in those yards, made lowest in the centre, will soon become saturated and prove an excellent stimulant to the soil and food for plants.—*Maine Cultivator*.

HEALTH.—The occupation of the farmer is favorable to health. Man was made for exercise—for toil—and in it he finds not only health, but happiness. The use of all our faculties, both of body and mind, constitutes the sources of pleasure. Inaction and sloth confer not this treasure for which man lives and toils. The most unhappy individuals and the most miserable, imbecile nations, are those whom necessity does not compel to labor diligently for a livelihood. Therefore let not the farmer regard his occupation as a slavish one, or look with envy upon the man who toils not with his hands. He has occasion to envy no one—there are some he can despise or pity if he pleases.

But when we commenced this paragraph, we intended to say a word upon the care which ought to be taken of health, and the means which should be used to preserve it—for it is much easier to retain than to gain it, and much more pleasant. The principal preservatives of health are, in the language of a cotemporary, "pure air, pure drink, plain food, exercise, cleanliness, protection, regular rest, occasional abstinence, and an active and well governed mind;" and we would add, temperance in all things. Each of these might be made

HARVESTING OF CORN.

The season for harvesting our corn crops will soon be upon us. The extremely hot weather which we have had for a fortnight past, prior to the late storm, has placed much of the crop out of the reach of frost; and the yield almost universally promises to be abundant. This may be pronounced the great crop of New England. If we have corn enough, we shall have beef, pork, and poultry enough. We do not believe there is any grain which, considered in all its aspects and uses, is so valuable.

There are several modes of managing the crop, the fodder and the grain; but they are not equally eligible.

The first is to top the stalks after the ear has become perfectly formed and slightly glazed. There is great danger of performing this operation too early. When done before the corn is generally hardened, the exact experiments of William Clark, Esq., of Northampton, of John Lorain, of Pennsylvania, and others, have demonstrated that the loss upon the crop may amount to a quarter or a fifth of what the crop would otherwise be. The topping of the stalks is, we believe, an unnecessary, useless, and often a pernicious labor, and therefore not to be advised.

The second method is to leave the crop untouched until it is perfectly ripened, and then to cut it up at bottom and carry it all into the barn and husk it. Some gather it in the field and then cut the fodder. In either case, the corn by being thus left, is always exposed to suffer from frost before it is perfectly ripened; and the fodder it is believed, loses much of its succulence and nutriment.

The third process is, after the ear is glazed and the corn has passed beyond the boiling or roasting state, to cut it up at bottom and let it dry in the shock. In this way it is early taken out of the way of the frost; the corn if properly managed ripens perfectly, and weighs more by the bushel than if perfectly dried, as by the second method described, and the corn fodder is dried with all its juices retained in it, and has a richness and freshness which render it particularly palatable to cattle and as nutritious for beef or milk stock as any dry feed which can be given to them. This operation should be executed with care. Let a hill occasionally be left standing for a support of the shock against the wind. Bring as many arms of the *corn* cut up as are sufficient to make a good sized shock around the standing hill—set the bottoms well out and tie them all at the top with a wisp of straw, turning the head down. But do not first, as is often practised, tie the corn in small bundles. In this way the corn and fodder will cure perfectly. When it is time to carry it to, slip a knife under and cut the standing hill; pitch the whole shock on to the cart; and being loose and easily handled by bringing the top of the shock into your lap, it will be easily husked. A great deal of trouble will be saved in this way. Do not, as is often done, carry out your corn and make your shocks upon the grass land, as in this case the air will not circulate freely under the shock, and therefore neither the corn nor the fodder will dry perfectly. The most intelligent farmers in the State estimate generally the value of the corn fodder on an acre of corn yielding forty bushels to the acre, well cured and saved, as equivalent for the feeding of any stock, to a ton of English hay. Not a few rate it even higher than this.

H. C.

TREE CORN.

This corn has been planted to a considerable extent and by a great many persons in parts of the State which we have visited. We have seen fields of it containing a quarter of an acre, and some more. It does not appear adapted to our climate, and there is a general disappointment in respect to it. We must not judge the case until the hearing is through; but much of it will require two seasons to ripen it; and we advise the cultivators to take it up as is recommended in the case of the *Mons. Multicaulis*, and set it out again next spring. If it lives and does well, we think it likely, or as the Doncaster schoolmaster said, "we presume to venture to hazard a guess" that they may get a crop next autumn. We are sorry that our agricultural friends are so disturbed with it. It seems to have "ruled" (?) the most philosophical. For his Withington Wheat and his Tree Corn, we hope our friend Thorburn will not get so many "kicks as coppers." He has got the coppers—we are afraid from indications which we have seen, that he would get from some of our friends the rest of the change, if he should come too near them. Brother farmers, keep cool! We cannot believe, we will not believe that our friend Thorburn designed to impose a lead article upon any one, certainly not with any knowledge of the fact. The seed of this Tree Corn seems to have multiplied in the country like the pieces of the original cross in Europe, of which there is no doubt, that many, many cords have been sold by the priests as genuine, and "no mistake."

H. C.

[For the New England Farmer.]

AGRICULTURAL PAPERS.

MR EDITOR—What is an agricultural paper worth to a farmer? is a question that often has been asked: these "book farmers" who are they? says the enquirer. Now, Mr Editor, I may as well cut with it. To conceal conflicts with that desire to benefit my neighbor, which sometimes I think I have, perhaps arising from the fact that my neighbor has benefited me, and not from that disinterested benevolence which should govern all—But how have I been benefited by my neighbor? why sir, one of these "book farmers" who subscribed for an agricultural paper, was willing to loan me the use of his, and after robbing the printer for some time, I found to be such a "book farmer" as I was liable to become by the reading of a weekly paper, would not add so much *disgrace as profit*; so I concluded to enter the ranks of what some call "book farmers," and subscribed for your paper, which has afforded me much profit and amusement. I was much gratified to find by your correspondence "T" and your remarks appended in a late paper, that this obnoxious term, "book farmers," after all is not so bad a thing. Now when this is fairly understood, I anticipate the subscription lists of publishers of agricultural papers will greatly increase, and the rising generation grow up feeling that a weekly paper for the farmer is as necessary as a plough or a hoe. I have felt that by persuading my neighbor to become the lawful proprietor of a weekly agricultural journal, would be doing him good, and in part atone for my own past unbelief and neglect.

Some say they cannot afford money to pay for a paper; one single idea obtained through a paper, will often save or put the farmer in the way of making enough to pay a ten years' subscription. I have thought that when such an excuse was made, you might say, "send us three bushels of barley, or six pounds of ruta baga seed." Excuse me for the suggestion. I would suggest almost any thing lawful, although not appropriate, to induce any brother farmer to place before himself weekly information which will do him good and thereby benefit the profession.

Do we love our country? then let us feel that she can be sustained only by an improvement in her agricultural branches. How can we improve without knowledge? How can we obtain knowledge without reading? How can we read unless provided with a paper or books?

Yours, very respectfully,

ACOSTA SEVERANCE.

Westboro', August, 1839.

The influence of agricultural papers has already produced a great change in the mode of operations pursued by our farmers: not that these papers have been very generally circulated; but through the influence of the example of those who have taken them. For instance, where an individual has taken an agricultural paper, the ideas he has acquired by its perusal are carried out in his farming operations; his neighbors see the effects of his reading in his improvements, and are excited to follow in his wake. In all our towns there are a few who shine in their profession as stars of the first magnitude, and whose light sheds a mild influence upon all around: make the enquiry and you will find out the reason why they excel their neighbors—they read, they reflect, they compare. They know what progress is making in their profession in distant parts of our own and in other lands, and the experience and wisdom of others widely scattered, is brought home for their own improvement and advantage.

It has often been a matter of surprise to us that while so large a number of papers are circulated in the country, many of which are productive of so little good, and others of a decidedly bad influence, that agricultural papers should be so little patronised. Every farmer should take a paper relating to his own profession; yet we venture to say that hardly one in ten does it. We should be very glad to effect this object, not for our own interest merely, but for the benefit of the country. We are willing to accommodate any who are short for money, and take our pay for the Farmer in almost any thing the farm produces, if by this means they can be persuaded to take it.

We thank Acosta Severance for the suggestion, and hope his desire for the diffusion of agricultural knowledge will be realized, as it most assuredly will when his neighbors can be prevailed upon to read. J. B.

□ We are happy to present in this number of the Farmer, the promised account of Mr Phinney's Pigs and Piggery, which no doubt will be perused with satisfaction and profit by all our readers. We have before spoken of them in terms of high commendation. He has been eminently successful in breeding and fattening swine, and we think his experience as communicated, will be of much importance to every farmer, whether he raises or fattens hogs on a large or small scale. J. B.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Aug. 24, 1839.

Sam'l Pond, Esq. exhibited very superior specimens of the following Plums, viz: Pond's Seedling, Italian Damask, and Royal of Mansfield.

Mr Jacob Dean, of Mansfield, exhibited four sorts of Peaches, three sorts of Pears, and several of Apples and Plums.

Mr Manning exhibited the following Plums, viz: Drap d'or, Early Orleans, Old Orleans, Nectarine, and the English Wheat Plum, very distinct from the Plum of the same name commonly cultivated in New England. Also, the long-stalk Blouquette, Skinless, and the Apple Pear (so called,) believed to be a native of New England, and a different fruit from the "Poire Pomme," described by French authors.

Mr Vandine, of Charlestown, exhibited a basket of large and beautiful Plums, name unknown.

Otis Johnson, Esq., of Lynn, exhibited the *Beurre Van Mouru*, a beautiful and good Pear, received some years since from the Messrs Baumanns, of Boiwiller, in France.

Benjamin V. French, Esq., exhibited the *Garden Royal*, an apple of fine flavor and decidedly a first rate fruit—origin unknown to the committee. Also, an apple of very large size, erroneously cultivated in many nurseries under the name of Alexander. In its external appearance it resembles the Dutch codlin of Ronald. If it be not the very same, it is a very distinct fruit from

the Alexander of the London Hort. Society's catalogue, a true figure of which may also be found by referring to Ronald.

Mr John M. Ives, of Salem, exhibited a beautiful yellow apple thickly striped with red, supposed to be the Duchess of Oldenburg, but not positively identified as that variety.

E. M. Richards, Esq. exhibited the Benoni and the Red Juncating, two of the best and most beautiful Apples of the season.

J. L. F. Warren, Esq. exhibited two baskets of the Bingham Plum, of large size and very handsome.

Mr Joshua Gardner, of Dorchester, exhibited the Purple Grape Plum. We think this cannot be the true Violette Reine Claude.

Mr S. R. Johnson, of Charlestown, exhibited a basket of Green Gage Plums, which, from their superior flavor and productiveness, stand not only in this country but in Europe at the head of all other Plums in cultivation.

For the Committee,
ROBERT MANNING.

BRIGHTON MARKET.—MONDAY, Sept. 2, 1859.

Reported for the New England Farmer.

At Market, 410 Beef Cattle, 240 Stores, 25 Cows and Calves, 4350 Sheep, and 610 Swine. About 70 Beef Cattle and 1000 Sheep were reported last week. 80 Beef Cattle and 1000 Sheep remain unsold.

PRICES.—*Beef Cattle*.—We quote to correspond with last week, about at the same prices having been obtained for a like quality. First quality, \$8 25 a \$9 50. Second quality, \$7 50 a \$8 00. Third quality, \$6 50 a \$7 00.

Stores.—Sales were made at lower prices. When prices shall become more settled we shall quote them.

Cows and Calves.—\$28, \$33, \$40, \$47, and \$65.

Sheep.—"Dull," and prices reduced. We quote lots at \$1 50, \$1 62, \$2 00, \$2 33, \$2 62, \$2 75, \$3 00, and \$3 50.

Swine.—Prices have further declined. Lots to peddle were taken at 5 1-2 for sows and 6 1-2 for barrows. At retail 6 a 6 1-2 for sows and 7 a 7 1-2 for barrows.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending September 1.

Multicaulis, Alpine and other Mulberries.

WILLIAM PRINCE & SONS' proprietors of the Linnæan Nurseries near New York, are ready to receive orders

Hale's Patent Horse Power and Patent Threshing Machine.

JOSEPH BRECK & CO. offer for sale this valuable machine and feel great confidence in recommending it as the best machine now in use. It will thresh from 75 to 100 bushels per day in the best possible manner. The horse power is calculated to propel any kind of machinery, is very simple in its construction, occupies little the small space of nine feet by two, and can easily be transported from one place to another, and when combined with the Threshing Machine it forms the most superior article for the purpose ever invented. They can be supplied at short notice at the N. E. Agricultural Warehouse and Seed Store. August 23.

New York Urate and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are not divided among the Stockholders, as are those belonging to another establishment, but sold to applicants, for cash on delivery. Orders are supplied in the order of time in which they are received. Urates 50 cents and Poudrette 40 cents per bushel, with contingent charges for bags or barrels, &c.

The company are daily preparing for use, during the warm, dry weather, the materials collected during the past winter, and will have several thousand bushels ready before the first of October next. The material is disinfected and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1833 and 1839, on Long Island, has satisfied many of the farmers that these manures have the quickest operation upon vegetable matter, producing greater abundance, and the cheapest of any manure they have ever tried.

Amended instructions for their use, the result of practical experience, will be furnished on application. The effect of Poudrette upon *Grape Vines* and *Morus Mutiliculis* is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manures, and farmers and gardeners may confidently rely on a supply.

Orders, post paid, directed to "The New York Urate and Poudrette Company," Box, No. 1211, Post Office, New York, or sent to the store of SHILLWELL & DEY, No. 365 Fulton Street, Brooklyn, will be attended to.

The Company will be very much obliged to gentlemen who have used the manures, to give them a statement in writing what has been the result of their use and experiments in relation to them.

New York, August, 1859.

AGRICULTURAL AGENCY.

The subscriber having been removed from the Post Office, by the pleasure of the President, and left for the present without any means of support, has consented to resume the

[From the Sobertown Morus Multicaulis Gazette.]

GREAT MORUS MULTICAULIS EXCITEMENT.

Great excitement in Sobertown.—Public Meeting.—Squire Jones called to the Chair.—Mr Wilson, Editor of the Courier, addresses the meeting.—Dr Potts discovers that the Mulberry leaf contains medical qualities, &c.

It is not my purpose to enter into a learned dissertation on the stupendous benefits our country is likely to receive in the successful culture of the mulberry, or to speculate on the influence which the raising of silk worms will have on the morals, religion and domestic habits of our people. These I will refer the curious of your readers to "Whitmarsh on the Mulberry Tree and Silk Worms."

I propose, however, to give a rapid sketch of the rise and progress of this speculation in the village of Sobertown, Connecticut—a village that, in former years was remarkable for the sober and staid industry of its inhabitants, and its freedom from all modern humbug. The farmer was contented with the fruits of his labor, the mechanic was fully employed in his workshop, and the merchant was satisfied with his profits. There was only one individual in the town who appeared restless and dissatisfied.

Squire Jones ever bore the comprehensive title of "speculator," and though of the age of fifty, and a bachelor, he was continually scheming and engaged in some new operation. In the early part of last spring, the Squire was often seen to work in his front yard, cultivating a few rows of small cuttings, which his ignorant neighbors supposed to be fruit trees. The occupation at first attracted but little notice, but soon the little trees began to put forth very large leaves, quite unlike any leaves in the village, and curiosity was at once aroused. The Squire gave evasive answers to the many inquiries of the busy bodies, which tended to heighten their wonder, and when, on one morning, they discovered that these mysterious trees had been taken up, and gone, the excitement exceeded all bounds, and the news flew like wildfire through the village. The natural anxiety was relieved, however, when the Squire entered the public bar-room in the evening, and stated that he had sold his trees which cost him ten dollars, to a stranger, for the sum of two hundred dollars, hard cash, and that the trees were *Morus Multicaulis*. This extraordinary sale set the whole village in a state of feverish excitement: crowds of idlers gathered before the fence which enclosed the Squire's front yard, and marvellous were the speculations there formed and related. It is impossible to say to what extent this excitement would have carried the villagers, had not Mr Wilson, the distinguished editor of the Courier, suggested that a town meeting should be immediately called, to adopt such measures as would best insure a general cultivation of the *Morus Multicaulis*. The people unanimously responded to his call, and on the day appointed, the Town Hall was filled with anxious spectators. Squire Jones was summoned to the chair, and the editor of the Courier proposed that he be called the "Great Pioneer," which was adopted with acclamations.

Mr Jones on rising was delighted to see so much enthusiasm manifested on the important subject which called them together. He considered the cause of mulberry trees the cause of the country;

and the raising of silk worms the cause of humanity. He had been in correspondence with a distinguished gentleman of Massachusetts, who assured him that the mulberry business was destined to be the great and absorbing business of the country, and that this gentleman had plenty of trees to sell. Mr Jones assured his hearers that all climates and every soil were favorable to the growth of the trees, and that the profits arising from the sale were unspeakable: he was not in the habit of indulging in speculation, but he felt authorized from his own experience, in saying, that every man, woman, and child would speedily amass a fortune by attending to the business. Plant mulberries! concluded Mr Jones.

Deacon Smith said, he had ever been an incredulous man—his friends thought it a fault—he had never believed in Metallic Tractors, Annual Magnetism, or Phrenology; but the lucid exposition of the "Great Pioneer," convinced him that the mulberry business was no humbug.

Mr Williams, the tailor, proposed that mulberry buds be considered a legal tender in traffic; this was objected to by Mr Hunter, the dry goodsman, as creating a difficulty in small change. Mr Wilson then arose and said he had a communication to make to his fellow citizens, which he thought would create a great revolution in the mulberry cause and materially affect the interests of the town and country. After mature deliberation and reflection, he had resolved to change the name of his paper from "Sobertown Courier" to that of "The Sobertown Morus Multicaulis Gazette." This announcement completely electrified the audience, and was received with corresponding applause. From the adjournment of the town meeting, *morus multicaulis* was the all engrossing topic of conversation. Every stage was watched as it entered the village, and the passengers questioned about the progress of the trade. Seeds and cuttings were purchased at enormous prices, and all hands turned to planting. The young and old, the rich and poor united in the work, and even poor Giles, the vagabond, was so much excited, that one day he imagined himself a silk worm, and went *reeling* through the streets. Autumn comes, and prosperity still shone upon the laborers. Squire Jones had been offered one thousand dollars for five hundred trees and refused it. Deacon Smith came very near selling out his whole stock at three dollars per tree, for the man asked him if that was the lowest price. It must be confessed, however, that amid this general prosperity, there were a few instances of ill luck and disappointment. Mr Williams, the tailor, bought a paper of seeds of the real Alpine Mulberry, of a pedlar, for a suit of clothes, which he calculated would yield a thousand trees, but what was his rage and horror, when he discovered that the products of his swards and labor was a bevy of double headed cabbages. Mr Hunter was also a victim: for he had procured of a Thomsonian doctor a bundle of trees warranted as the real *Multicaulis*, but they grew up crab apples, and the insects upon them which he at first thought a spontaneous growth of silk worms, proved to be caterpillars.

Schemes were formed for future operations.—Squire Jones thought the attention of Congress ought to be called to the subject, and proposed that samples of the soil of Sobertown be forwarded to our representatives, requesting them to present the samples to the chairman of the committee of commerce, and ask him to make a report. Deacon Smith thought as sandy soil has proved favorable to

the growth of mulberries, it would be expedient to send a committee to the Desert of Sahara, to test the value of that spot. Mr Wilson, of the Gazette, thought the plan feasible, but premature. Mr Crane, the mechanic, was busy in taking out a patent for a machine by which he could make a silk worm spin an endless thread, without fear of bursting. His leaves were to go in at one end of the worm and come out silk at the other. He thought this invention would smother the cotton gin into merited magnificence. Dr Potts had analyzed the mulberry leaf, and discovered that it contained medicinal qualities, with a large share of meagleness: he had already ordered a steam engine to manufacture pills, and had resolved to call his medicine "The Leviantian Morus Multicaulis Pills."

An article appeared in the Gazette, recommending "forced growth," "bottom heat," and "green houses." Squire Jones, "the Great Pioneer," was detected in clearing out his conservatory, filling it with boxes containing earth, and repairing his furnace. The secret was soon out. Every green house, hen house and smoke house was secured; raisin boxes and fig drums rose a hundred per cent, and cuttings commanded any price. The whole town shared in the excitement—even the ladies painted boxes of mulberry shoots to grace their drawing rooms instead of flowers and orange trees. Mr Crane positively asserted that he had discovered how to produce "bottom heat," by running flues under the earth and supplying them with hot water. Deacon Smith thought *hens* might be used to advantage in accelerating the development of the buds, and though this novel application of hen-labor might be thought detrimental to the egg-producing interest, he thought the result would be different, and that hens would lay better than formerly. The very boys of the village emulated as far as their means permitted, the enterprising spirit of their parents, and carried about in their pockets roots and cuttings, and even slept in their pantaloons to ensure a uniform temperature.

The winter has just passed, and the result has equalled the expectation of the sanguine, though not a person has had an offer for a single tree. Still the work of transplanting is going on with unabated vigor. Our village is a wilderness of mulberries, and it is computed that the value of the trees at asking prices, exceeds one million of dollars.

REVOLVING HORSE RAKE.

The Revolving Rake which has been in general use in most parts of Pennsylvania and New Jersey, is found to be one of the most useful and labor saving machines now in use. The man and horse with a boy to lead, will rake on an average from 25 to 30 acres per day, with ease, and do the work well. They are coming into very general use in all parts of the country, and will, no doubt, in a few years supersede the use of the common hand rake. There is a great advantage in this rake over all others, as the person using it does not have to stop the horse to unload the rake. For sale by JOSEPH BRECK & CO., 51 and 52 North Market Street.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street. July 10.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at 53 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

AGRICULTURAL.

From the Third Annual Report on the Geology of Maine.

MANURE FROM PEAT AND LIME.

Peat also occurs abundantly in the same meadow, and by a little chemical skill may be converted into an excellent manure by means of a mixture of lime and a little barn-yard manure, or any animal matter. Thus three or four cords of the peat mixed with one cord of animal manure, and treated with a cask or two of slaked lime, will make a compost superior in value to five cords of the best stable manure alone. They ought to be placed in alternating layers, thus:

PEAT,
—————
LIME,
—————
ANIMAL MANURE,
—————
PEAT,
—————

&c.

The whole forming a regular compost heap. The chemical reactions which follow are chiefly thus:

The lime extricates a large quantity of gaseous ammonia from the animal matter, which is absorbed by and enters into combination with the peat, and is thus retained ready for use in the state of ultimate or geat of ammonia—a most powerful manure—and the lime becomes completely carbonated or air slaked by the carbonic acid given out during fermentation, and in this state is a proper and permanent ameliorator of the soil. The peat is converted into a powder and soluble pulp, and becomes more suitable for the nutriment of plants. While if lime and animal matter was used in excess, we shall have also a considerable quantity of carbonate of ammonia in the peat, a well known and powerful saline manure.

In case the soil is sandy, the clay marl, neutralized with lime, is the most proper amendment for it, and such is generally the condition of the fields in Saco, so that by a proper use of this marl, the happiest effects may be realized by the farmers in that town.

I could quote other instances of the kind, but the

Larington, January 30, 1830.

DR. CHARLES T. JACKSON,

Dear Sir—I herewith send you a sample of my peat. I am very desirous of availing myself of the benefit to be derived from a chemical analysis of the same, which you kindly offered to make.

A more intimate knowledge of the nature and properties of peat, which can be obtained only by a scientific examination of its constituent parts, would enable farmers more justly to appreciate this valuable species of land. It is from a want of this knowledge, that our extensive tracts of low meadow and swamp lands have hitherto been esteemed of little or no value. Allow me to say, sir, that I know of no way in which you could render a more essential service to the public more especially to farmers, than by enabling them to convert their unproductive and unsightly bogs and morasses into luxuriant fields and sources of wealth. I consider my peat grounds by far the most valuable part of my farm—more valuable than any wood lots for fuel, and more than double the value of an equal number of acres of my uplands, for the purposes of cultivation.

In addition to these, they furnish an inexhaustible supply of the most essential ingredient for the manure heap. A statement of the uses to which I have appropriated peat lands, and my management of them, though very imperfect, may serve to give you a partial conception of their value and uses, and at the same time enable you to see how important it is that the farming community should have more information on this subject.

In the first place they are valuable for fuel. I have for twenty years past resorted to my peat meadows for fuel. These, with the prunings of my fruit trees, and the brush from my uncleared lands, have given me my whole supply. The prunings and brush are bound in bundles, and housed, and with the help of a small bundle of these faggots, and peat, a quick and durable fire is made. It gives a summer-like atmosphere, and lights a room better than a wood fire. The smoke from peat has no irritating effect upon the eyes, and does not in the slightest degree obstruct respiration, like the smoke of wood; and it has none of that drying, unpleasant effect of a coal fire. The ashes of peat are, to be sure, more abundant, but not more troublesome, and are less injurious to the furniture of a room,

when dried. It may be cut from May to September. If the weather in autumn be very dry, the best time for cutting will be from the middle of August to the middle of September. If cut the latter part of summer, or early in autumn, it dries more gradually, and is not so liable to crack and crumble, as when cut early in summer. The pieces are taken out with an instrument made for the purpose, from two to three inches square; and if of good quality will shrink about one-half in drying. It is considered a day's work for a man, a boy and a horse, to cut out and spread a rod square. The man cuts it out, and lays it upon a light kind of drag, made for the purpose, and it is drawn off by the horse, and spread by the boy as thick as the pieces can lay singly. After becoming dry enough to handle without breaking, it is made into piles, cob-house fashion, of from twelve to twenty pieces in a pile. It will then require about four weeks of dry weather to render it fit to be housed for use. The top or turf is thrown back into the pits from which the peat is taken; and if well leveled, and the ground drained, it will, after the first year, give a large crop of foul meadow, or other lowland grass. Peat taken from land which has been many years drained, when dried, is nearly as heavy as oak wood, and bears about the same price in the market. The value of peat and swamp lands for tillage, is now pretty well known and acknowledged. Some years since, I occasionally sold to my neighbors a few rods of my peat land, yearly, to be cut out for fuel, at three dollars per rod, being at the rate of four hundred and eighty dollars per acre; but finding this sum to be less than its value for cultivation, especially when laid to grass, I have declined making further sales at that price. I have raised upon my reclaimed meadows seventyfive bushels of corn, five hundred bushels of potatoes, or from four to five tons of the best hay, at a first and second cutting, to the acre, at a less expense of labor and manure, than would be required to produce half this crop upon uplands. To render these lands productive, they should be thoroughly drained, by digging a ditch around the margin of the meadow, so as to cut off the springs and receive the water that is continually flowing in from the surrounding uplands. If the meadow be wide, a ditch through the centre may be necessary, but this will be of no use without the border ditches.

brought iron share or coulter, ground to a sharp edge in the driest season, say in the month of September—roll down as hard as possible, carry on in the winter a sufficient top-dressing of compost, twenty cartloads to the acre, and in the spring plant with corn or roots, without disturbing the soil.—When the corn or roots are taken off, the surface is made smooth with the cultivator, or hoe and harrow, and late in November, or just before the heavy frosts set in, sow with herd's grass and red-top seed, half a bushel of the former and one bushel of the latter to the acre. The field is then rolled, which completes the process. If the plough does not turn the sods smooth, it will be necessary to follow it with the bog-hoe, to level the uneven places. By keeping the sod undisturbed in the cultivation, a more firm and compact surface is formed, upon which oxen or horses may work, generally, without danger of miring. If the land is intended for grass, without the intervention of a hoed crop, the turfs are turned over with the plough, as before stated, in August or September, or as early as the surface becomes dry enough to admit the oxen or horses upon it; then follow with the bog-hoe, and turn over such parts as the plough has left unturned, make the whole smooth with the hoe, and late in November, spread on a top-dressing of compost, not less than twenty cartloads, made half of loam and half of stable manure, to the acre; then sow the grass seed, and bush, and roll down. If the ground be miry, so as to render the use of the plough impracticable, the bog-hoe must be resorted to, and the whole turned over by hand, and top-dressed, and seeded to grass, as above stated. The cost of turning over with the hoe will be twenty dollars per acre, at the usual price of labor. This mode of culture completely subdues the natural wild grasses, and gives a compact and rich surface of vegetable mould, which will give an abundant crop of the best English hay for four or five years, without the aid of more manure. If the sod is disturbed and attempted to be pulverized in the course of the cultivation, the surface, when laid to grass, will be loose and spongy—an extra top-dressing of loam and manure will be required, and after all, the surface will not become so compact, nor the produce by any means so great. Should meadows be found too soft and miry to admit of their being ploughed in the summer or autumn, and the expense of turning with the hoe should be thought too great, I would advise ploughing in the spring, when the frost is out, to the depth of three or four inches, catting on the manure, and then sowing or planting at a convenient and proper season. The art of reclaiming these low meadows, consists in taking off all the surplus water by judicious draining, and in thoroughly exterminating the natural herbage and grasses. This being effected, we have our rich bottoms, equally as productive as the deep alluvials of the west, and obtained at a cost and sacrifice infinitely less.

The third particular in which peat lands may be considered valuable to the farmer, consists in furnishing him with a very important ingredient for his compost. Peat is made up principally of decomposed vegetable substances, with a portion of the lighter particles of vegetable mould, washed in from the surrounding highlands. But when taken fresh from the pit, it contains certain antiseptic properties, injurious to vegetation, which must be absorbed or neutralized, by a combination with other substances, in order to render it food for plants. This may in some measure be effected by exposure to

the action of the air and frost. Where the surrounding uplands are composed of gravel or sand, the peat or swamp mud may be called silicious, and is less valuable for manure, especially if the adjacent uplands rise abruptly; when composed principally of clay, the peat is aluminous—this is frequently found resting on beds of marl, and is considered much richer, and more valuable for the compost heap.

I have annually, for some years past, used on my farm some hundreds of loads of peat mud, which is either thrown into my hog sty or mixed with fresh stable dung, or with lime. When mixed with green stable manure, the proportions are two parts of peat mud to one of dung; and I am confident, from repeated experiments, that a load of this compost well mixed and fermented, will give as great a produce and a more permanent improvement to the soil than the same quantity of stable manure. In this opinion I am not alone. Other accurate and intelligent cultivators have made similar experiments with similar results.

The vegetable substances of which peat is composed having been decomposed in stagnant waters, they have not passed through a putrefactive fermentation, and are therefore supposed to retain much of their natural oils, gums and acid. Peats in this region, are also supposed to contain portions of sulphate of iron, or coppers, oxide of iron, &c. This opinion is formed from noticing the difference between the effect produced by using the peat mud on ground, when first taken out of the meadow, and that which is produced after fermentation, with stable manure, or by mixing it with lime. The ashes of peat have little or no perceptible effects, when used alone, but by mixing them with lime, they become a valuable manure.

That our peat may possess other and different properties, which are in a great or less degree injurious to plants, is highly probable. These can be detected and remedied only by the aid of science. It is to the agricultural chemist that the practical farmer must look for a development of his resources, to remove the obstacles which impede his progress, and to impart that information which will give confidence to action, and a successful issue to labor.

With an earnest desire that you may persevere in your useful labors.

I am, dear sir,

With the highest respect,

Your obedient servant,

E. PHINNEY.

Having two years since, given to Dr. N. C. Keep some instructions relating to the management of peat compost, that gentleman communicated them to his father, an old and intelligent farmer, residing at Louineadow, upon the Connecticut river; and the experimental trial having been made to his satisfaction, he politely furnishes me with the following interesting statistics:

To CHARLES T. JACKSON, State Geologist, &c.

Dear Sir—Being much indebted to you for information in regard to the use of peat, as a manure, and the mode in which its acid properties may be not only neutralized but made a most valuable food for plants, I beg leave to state, that in the fall of 1836, I took from my bog about three cords of peat, and placed it in a pile on the nearest solid land in the woods. It remained there undisturbed until sometime in November, 1837. By the action of the frost of the preceding winter, and the heat of the

summer, it had lost much of its adhesive property, and was greatly reduced in weight.

I now brought it home, and while one was unloading, another sifted in lime with the hand, (it having been previously slaked to a fine powder,) at the rate of one bushel to a cord of peat. Lime having been thus scattered evenly through the whole mass, nothing further was done to it until about the middle of next May. Observing, after the manure had been removed from the barn-yard, that a considerable quantity of water from the rains had collected itself in the lowest part of the yard, (say six or eight barrels,) I had the peat removed into it. The garnet-colored wash of the yard was rapidly and entirely absorbed. I allowed it to remain in this situation until the first of June, during which time its color had changed from mahogany to a jet black. Fermentation did not take place.

By the successive action of the frost, lime, and the wash of the yard, the sensible qualities of the peat had very much changed. When first taken from the bog it was pulpy and very adhesive—could be spread like butter; now it was a fine powder, having entirely lost its peculiar adhesive properties.

I used the manure thus prepared, for squashes—planting fifteen rods of ground, very sandy and much exposed to drought. After the manure had been dropped, (one shovelful in a hill,) I sprinkled a little lime in each hill, directly upon the peat.—Upon this I planted the autumnal marrow squash. The seeds came up well, and the plants were of a healthy color. Some of the plants were entirely destroyed, and all of them badly eaten by insects; the yellow bug was most destructive. The plants, after they had recovered from this shock, grew more rapidly than any that I had before witnessed. The color of the vines, and the rapidity with which they covered the ground, were most convincing proofs to my mind that they were perfectly healthy, and well supplied with nutriment. In the severe drought which came on in the summer, these vines, for many weeks, did not appear to suffer, while others of a similar kind in the neighborhood, were dead and dying. The result was, that notwithstanding the long continuance of the drought, in which nearly all our potatoes, peas, &c. were killed, these squashes were preserved, and yielded a middling crop.

I also used the compost, as above, on intervalle land, near the Connecticut river—soil alluvial—no stones or gravel—can be easily compressed—does not bake in the sun—has been cultivated for more than one hundred and fifty years, and yields a very scanty crop without manure. The compost was spread over the ground and ploughed in, at the rate of nine cords to the acre of ground: thus prepared, I planted thirty rods with sugar beets—distance between the rows, eighteen inches—hills eight inches—one seed in a hill. The seeds proved bad, not more than one-third coming up—yet I had 116 bushels of beets; while above an acre of the same land manured with the best stable manure, at the rate of twelve cords to the acre, did not produce one hundred bushels. Two rows of potatoes were planted next the beets; the land had been designed for beets, and was prepared precisely the same. Between these two rows and more than an acre immediately adjoining, (where a large quantity of best barn-yard or animal manure was used,) there was a very perceptible difference in favor of the former. I also planted a few hills of potatoes on very sandy land, in the latter part of June. Into the hills I put peat, which had been saturated with lye, from

the bottom of a soap tub—no lime. The tops of these potatoes, during the whole drought, were of the most living green, and the most luxuriant growth that I ever beheld. They were killed by the frost in the fall before maturity. The potatoes were small.

In conclusion, I would mention that I am so well pleased with the result of these experiments on a small scale, that I am now preparing one hundred and fifty cords of peat and fifty casks of Camden lime, and all the animal manure I can make, to enrich as fast as possible my whole farm.

Expense.—I get out my peat by ox-team and cart. Three men can, in this way, get out eight cords per day, \$4 00; price of lime, \$1 30 per cask. My peat being three and a half miles from my barn, that portion of it which I bring home, I estimate to cost me for carting, \$1 00 per cord.—The peat and the lime for the compost—using one-third of a cask of lime to a cord of peat—then, cost me on the ground near the peat bog—three cords of peat, \$1 50; one cask of lime, \$1 50; that which I cart home, \$1 00 per cord more.

I intend to put about one-sixth part of animal manure, but as it cannot be purchased in any adequate quantity, it is more difficult to fix a price.—The nearest place where livery stable manure is sold, is four miles; price there per cord, \$3 00; cost of carting, \$1 50.

Five cords of peat delivered,	\$7 50
Two and one-third casks of lime deliv'd,	3 50
One cord livery stable manure,	4 50

\$15 50

divided by six, the number of cords, not estimating the increase of quantity from the bulk of the lime, gives the cost, two dollars and fifty-eight cents, delivered, or one dollar and fifty-eight cents per cord at the peat bog.

(Signed) SAMUEL KEEP.

Dear Sir—Herewith are the facts collected with care, at my request, by my father, Samuel Keep, of Longmeadow. My own opinion is, that a new era has begun in agriculture. The quantity of one-third of a cask of lime to a cord, was selected in the absence of chemical experiments, to determine how much was absolutely needed to neutralize the ulmic acid, because he prefers to put on ten to twelve cords to the acre—and twelve cords would take four casks of lime to the acre. If lime was as cheap as in Maine, he would probably have put in more. Notwithstanding the expense appears to be great, my father feels confident that he gets a better article in compost at \$2 58, than the livery stables furnish at \$3 00, with the additional cost to him of \$1 50 for carting, making \$4 50.

N. C. KEEP.

The great principles of Agriculture are the same every where. Animal and vegetable matters constitute every where the food of plants; and heat, moisture and atmospheric air, universally, the ac-

For the New England Farmer.

Avondale, near St. Charles (Mo.), Aug. 21st.

MESSRS JOSEPH BRECK & Co.

Gentlemen.—Your paper of the 7th inst. is just received, and seeing in it an account of the failure of the "Whittington White Wheat" in consequence of its proving to be a *winter*, instead of a *spring* wheat, and seeing further, a suggestion to *move* it, in the expectation of its producing *next year*—I hasten to inform you of an experiment made by me with *winter* wheat, which if it reach you in time may possibly be of service to those who have been disappointed.

In the fall of 1837 I sowed some *white wheat*, but not the "Whittington" and had a remarkably fine crop. Its appearance early in the spring of 1838 induced me to try an experiment with *fourteen quarts* of the seed, which I had left after my fall sowing, in order to ascertain two points—first—whether it could be made a *spring* wheat—and secondly, whether the oft repeated statement was true, viz: that smooth stem wheat (*winter*) sowed in the *spring* could become *bearded*. The result of the experiment I herewith send you.—Above twenty heads or more came to maturity in 1838 and was good wheat—the balance produced nothing. I did nothing with it except pluck the heads that had come to maturity and throw the grain away. Having satisfied myself with this part of the experiment, I allowed the wheat to remain, entirely undisturbed, till this year, not doubting but that it would all come to maturity like other fall wheat; and having very little doubt that it would come bearded (it was a smooth stem wheat.) I find however, it does not change its nature—it is still smooth stem wheat. It however came much later, perhaps two or three weeks late than fall-sown wheat, and yielded I presume about three pints or two quarts of seed—I not did gather it, and of course did not measure it—but being a Yankee exercised my birth-right and *guesseed* at the product.

From this experiment I am inclined to think that those who sowed the "Whittington wheat" may effect some return for their seed, if they should leave it *undisturbed*. I think I should have gotten a larger return this year, had not the winter killed much of it. Whether mowing it will benefit it or not, I presume every man can judge for himself; I thought my experiment so much to the point at issue, that I send you this "*unlicked cub*" in the hope it may reach you in time to prevent the destruction of the "Whittington wheat."

With sentiments of respect,

I am, Gentlemen, Yours,

WILLIAM CLOUGH.

P. S. In examining this hastily written scrawl I find there may a question arise, viz: whether, when I plucked the ripe heads and threw the grain away—I threw them among the remaining wheat, and consequently whether the "three pints or two quarts" were not in the produce of the grain thrown away—I therefore state, that the produce this year, was

Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, Sept. 7, 1839.

The display of *Dahlia's* was the best we have had the present season. Col. Wilder takes the lead: he presented twenty-six fine specimens. Among them we noticed Rienzi, Ne plus ultra, Ansell's Unique, Knight's Victory, Sarah, Striata formosissima, and others of great beauty.

Messrs Hovey & Co. presented ten varieties, viz: Ne plus ultra, Striata formosissima, Unique, Rienzi, (fine,) Mrs Rushton, Middlesex Beauty, &c.

By Joseph Breck & Co.: Striata formosissima, Ansell's Unique, Golden Sovereign, Star, Granta, Medona, Gem, Sarah, Ariel, &c.

By Mr D. McIntire: Sudbury Hero, Mrs Rushton, and Rival Sussex.

By J. J. Low, Esq.: Striata formosissima, and Unique.

Mr J. L. F. Warren, of Brighton, presented many fine specimens with other cut flowers.

Bouquets, by Mr Wm. Kenrick, J. Hovey and S. Walker.

Cut flowers, Asters, Balsams, &c., by Messrs Breck, Warren, Johnson, and S. Walker.

Native plants, by Wm. Oakes, Esq., (exhibited Aug. 31st.)—*Lobelia cardinalis*, *L. inflata*, *Mikania scandens*, *Zizania aquatica*, *Mentha borealis*, *Gerardia purpurea*, *Liatris scariosa*, *Polygala sanguinea*, *Sanguisorba Canadensis*, *Helianthus divaricatus*. *Coreopsis trichosperma*, *Corylus Americana*, *Sonchus acuminatus*, *Cicuta bulbifera*, *Scirpus Eriophorum*.

Plants exhibited by Wm. Oakes, Esq., Sept. 7—*Arbutus Uva Ursi*, *Liatris scariosa*, *Myrica cerifera*, *Lespedeza hirta*, and *L. sessiliflora*, *Arum triphyllum*.

Native plants, by E. Weston, jr., Esq. and F. Parker: *Lobelia inflata*, *Gnaphalium uliginosum*, *Antennaria Canadensis*, *Ranunculus repens*, *Polygonum sagittatum*, *Hypericum parviflorum*, (in fruit,) *Potentilla argentea*, *Neottia cernua*, *Gentiana crinata*, (in bud,) *Aster dumosus*? *A. Cyanus*, *A. Laevis*, *A. Punicus*, *Solidago nemoralis*? *Bidens corymboides*, *Trifolium arvense*, *Aster corymbosus*, *Eupatorium verticillatum*, *Lobelia inflata*, *Aster amplexicaulis*, *Hypericum parviflorum*, *Helianthus divaricatus*, *Apocynum androsaemifolium*, *Gerardia maritima*, *Chelone glabra*, *Mentha viridis*, *Neottia cernua*, *Trichostema dichotoma*, *Mentha borealis*, *Hedysatum hamifusum*.

For the Committee,

S. WALKER, *Chairman*.

THE COMMITTEE ON FLOWERS

Are requested to meet at the rooms, 23 Tremont Row, on Saturday next, 14th inst. at 12 o'clock.

Per order,

S. WALKER, *Chairman*.

Boston, Sept. 7th, 1839.

COST OF RAISING SUGAR BEETS AND OTHER ROOTS.

In examining an estimate of the expenses of making beet sugar in this country, many farmers will consider that the expense of raising the roots is reckoned too low; this is owing to the little attention that has been paid to root crops; and to farmers in general not being acquainted with the best and most economical method of culture, and not having machines and implements to enable them to manage the growing of root crops to advantage.

These unfavorable opinions will in a measure continue, till root culture is more in practice, for though cases are stated of crops raised at a small expense, they will be regarded as extraordinary cases, and estimates made on paper, in which no error can be pointed out, will be looked upon as something uncertain; yet these favorable accounts will lead the enterprising and intelligent to try and see whether these things are so, and although their expectations may not always be realized, yet they will find a great advantage in attending to root culture and be led to inquire into the most frugal method of pursuing it. Farmers who dig up a small patch and sow it in beets, and do not weed it till there are five hundred weeds to one plant, may find that the cost of raising a bushel of beets is one dollar, when with prudent management in raising on a large scale, ten or twelve bushels could be raised with this expense.

In raising beets and some other crops in a garden, we have managed to do the weeding before sowing, and find that it is a great saving of labor; that is, pursue that manner of culture that will destroy the weeds before the seed is sown; and the same plan may be followed in field culture, and even to greater advantage, as most of the labor can be done by animal labor, which is much cheaper than manual labor in this country, and this as has been observed in the articles lately published on the subject, will enable us to raise beets as cheap as they are raised in France.

Our method has been to put on the manure and stir up the ground in the fall or early in the spring—the former is preferable, as the frost will loosen the soil and make it mellow, and the weeds will start in the spring before the soil is dry enough to work; when the weeds were well started, we worked the ground over again. About the 20th of May the ground was well worked over, and the seed sown, after being soaked, so that it would come up in a short time; the plants were up and large enough to hoe when scarcely any weeds appeared, the hoeing was done in a short time, the soil being very light and mellow, and there was but little trouble on account of weeds through the season, they having been mostly destroyed before sowing. If this plan should be pursued in field culture, it would save nearly one-half of the expense. One hour's work with a horse and cultivator in stirring the earth and destroying weeds before sowing, would save several days in hoeing.

The following method of culture for a field crop, would be very economical as to weeding, which seems to be the most expensive part of cultivation. A piece of land, a deep mellow soil, that has been well manured and planted one year in corn or potatoes, would be in good condition for a beet crop. If it has been ploughed more than one year, there would be danger from the grub worm, which we believe is the principal injury from insects to which the sugar beet is liable.

A piece should be selected that can be ploughed deep, and the stones, if any, removed. If there has not been sufficient manure applied to the previous crop, apply the manure and plough the ground very deep in the fall, if it cannot be done at this season, then as early as possible in the spring. When the weeds have started, go over it with a cultivator, and in a few weeks go over it again in the same way; this will loosen and pulverize the soil and destroy the weeds. From the 20th of May to the 1st of June, let the earth be thoroughly stirred with a cultivator, or if the soil be not very loose it may be well to plough it again, then go over it with a light harrow to make the surface level and smooth, and the soil fine; be ready to sow as soon as the ground is prepared, while the surface is moist, and that the plants may get the start of the weeds.—Pour water as hot as can be borne by the hand on the seed, and let it soak a day and a half or two days, then it will vegetate and be up, and the plants will be large enough to hoe before the few weeds that are able to grow, get up so as to be much trouble.

Sow the seed with a machine and the expense will be light. Let the rows be from two to two and a half feet apart, then a light cultivator may be used between the rows; in thinning the plants let them stand about one foot apart. If any places are vacant from the seed not growing or the grub worms eating them the deficiency may be supplied by transplanting; though transplanted beets do not form so handsome a root, yet they yield about as much as the other. The expense for weeding and loosening the soil will not be great. In harvesting, if the beets cannot be pulled easily, a furrow may be ploughed near each row with a horse plough, then they may be pulled with little labor. By this, or some better way if it can be devised, beets may be raised at a small expense, and as lands and animal labor are cheaper here than in France, and as much labor can be done here by animals which is performed there by the hands, we think our advantages are equal to those of France in the cheapness of manual labor. But supposing our advantages in raising the beets are not equal to a cheap production, we have reckoned the expense higher in the calculations we have published, so as to conform to a fair estimate on all expenses. Instead of \$3 20 per ton as in France, we have reckoned at \$5 per ton. No calculation on the expense of raising beets or other crops can be made exactly suited to all parts of the country, as the prices of labor and land are different. Near cities and large towns, and near the seaboard, owing to good advantages for markets and communication, lands are higher, and the rent of them mere, of course, than in the interior; in such cases labor too is usually somewhat higher.

Estimated Expense of an acre of Sugar Beets.

Use of an acre of land well prepared for beets and manured, or managed in the previous crop—	\$12 00
Ploughing	4 00
Cultivating, horse, cultivator and hand two hours	50
Two weeks before sowing	1 00
Harrowing	50
Seed \$2 25, sowing with a machine 75	3 00
First hoeing	4 00
Second hoeing, thinning, and transplanting to supply deficiencies	4 00

Hoeing again and loosening the ground with machines,	2 00
Harvesting	9 00

\$40 00

Make the rows 2 feet 4 inches apart, and then a cultivator can be used in hoeing. If the beets stand one foot apart in the rows, and weigh 2 1-4 lbs. each, the yield will be 20 tons. In rich ground at that distance, a great number will weigh 4 or 5 lbs. each; twenty tons is a good crop, but not extremely large, for in some cases 25 or 30 tons to the acre have been raised in this country. At the above expense of 40 dollars to the acre with a yield of 20 tons, the cost would be two dollars per ton. We make this estimate to show how cheap beets may be raised under favorable circumstances, such as good land at a fair price, convenient machinery and implements, and the most prudent management in the culture, with labor at a moderate price, and a favorable season. We have no doubt that in some parts of New England beets could be produced in great abundance at the above price; but we must not always expect a combination of favorable circumstances.

Supposing we reckon the produce only two-thirds as much as above, say 13 2-3 tons and the cost 32 1-2 per cent. more, which will be \$53 33; then the cost of the beets will be only \$4 per ton, one-fifth less than Mr Bosson reckoned in his calculation on the cost of beet sugar. If we reckon 50 pounds to the bushel, 13 1-2 tons per acre would be only 533 bushels, which would be no more than a middling crop; not half as much as has been raised in a number of cases that have been named.—*Yankee Farmer.*

REMARKS ON THE USE OF LIME IN AGRICULTURE.

We may now draw, says the highly intelligent author of an essay on the use of lime, a few plain and practical inferences from what has been stated, and which are sustained by thirty years practice in the use of lime.

1st, That lime operates equally well, whether applied in a hot or effete state, provided the condition of the ground upon which it is used, be such as to render a calcareous application beneficial.

2dly, That, in respect of operation, it is immaterial whether the lime be used upon grass land or summer fallow, and that objects of convenience ought chiefly to weigh with the farmer in ascertaining the most proper time for applying this article. Upon old grass land, it is perhaps best to plough first, and to summer-fallow in the second year, when lime can be applied. On new and clean grass land, hesitation is superfluous; it may be limed at the outset, that is, before the plough is admitted.

3dly, That to lime moorish soils is a hazardous business, unless dung is likewise bestowed; but to repeat the application upon such soils, especially if they have been severely cropped, is almost a certain loss, and that a compost of lime and rich earth is, in such cases, the only substitute.

4thly, That strong loams and clays require a full dose to bring them into action; such soils being capable of absorbing a great quantity of calcareous matter. Lighter soils, however, require less lime to stimulate them, and may be injured by administering a quantity that would prove moderately beneficial to those of a heavy nature.

5thly. That upon fresh land, or land in a proper state for calcareous application, lime is much superior to dung. Its effects continue for a longer period; while the crops produced are of a superior kind, and less susceptible of injury from the excesses of drought and moisture. Finally, the ground, particularly if of a strong nature, is much easier wrought; and, in many instances, the saving of labor would almost tempt a judicious farmer to lime his land, were not a greater benefit derived from the application than the opportunity thereby gained of working it in a perfect manner.

It may be added, that though strong soils require to be animated with a good dose of lime, those of a light texture will do equally well with little more than half the quantity requisite on the others, especially if they are fresh, or have not already received an application of calcareous matter, in every case it is the farmer only who can judge of the quantity to be given: but, as a general principle, it is safer to exceed the proper quantity than to be below it. In the latter case the application may prove useless, and the whole expense be lost; whereas, it rarely happens that injury is sustained from an excess, especially if more or less dung is soon after administered."—*American Farmer*.

From the Maine Farmer.

SALTPETRE FOR GARGET.

Taking sometime since the hint from the Farmer, I tried saltpetre as a remedy for the *garget* in cows; and am able from the result to state—and I do it with confidence—it is decidedly the best remedy I ever knew used for that troublesome disorder to the dairy. The cow, otherwise an excellent one for milk, which I gave it to was so badly diseased, or rather so subject to the disease, as to be nearly useless a great part of the summer season. She was a *doomed* jade to be passed over to the butcher the coming fall, when about the middle of May last I tried the saltpetre as recommended in the Farmer. I gave what I supposed a pretty strong dose—something like two ounces—and in less than twelve hours her milk was restored good as ever; and has not been affected since. Two oz. may perhaps be more than is necessary at a time for a dose. How this may be I presume not to say.

On seeing the good effect in this case I adopted the notion of mixing saltpetre with common salt to give stock. I allow at the rate of about 2 lbs per bushel—perhaps less would answer the purpose as well; I pretend however to no exact knowledge as to part. I have heard it suggested that saltpetre will have an injurious effect upon the blood of the animal if given constantly as with common salt. I am not determined as to the fact upon this point. Will you, Mr Editor, or some one or more of your kind correspondents, who may possess "experimental knowledge" upon the point, please inform through the Farmer.

The health and goodcondition of cows is indispensable to a profitable and wholesome dairy; hence no person that would produce good butter and

same way he complains of. What, however succeeded with this cow may not with any other. I mention the affair more as a matter of my success, than as a "remedy," particular or general, for cows similarly affected, or troublesome, for I consider it more a *habit* than a disorder.

"Old Flag"—for so we call her—had just had her calf weaned and she showed great anxiety and no small "fuss"—bellowing, shaking her horns, snorting, &c. as cows are wont to do on such occasions; and anon she "holds up her milk," as the saying is. I really believe the old jade essayed to retain her milk for "poor bossy,"—and who would blame her for so motherly a disposition? So taking a stool and quietly seating myself by her side, I resolved to watch her maneuvering, and by persevering trial and kindness to overcome the evil. (Kindness, the *law* of kindness, I believe would overcome every evil in the world—not only cow-wills but man-wills, if but perseveringly persisted in.) I soon found she made very visible effort to contract the "milk veins" so called, or to do a *certain something*—call it what you please—to prevent its flowing into the udder. This was in the morning, no such trouble at night when the excess of milk would not permit her to keep it from coming down. This if I understand Mr W. was the case with his cow, and his also had had her calf but lately weaned. What, now was to be done? Simply, if I can right, to *imitate* as nearly as the awkward hand can do the calf in bringing down the milk.

To describe, adapting the *phrase* to the hand process, thus—strip out what little may be in the bag, then press up hard against it as does the calf in *bunting*, and then still holding on to the teat but loosely excepting at ends of it which hold fast with the little finger and lower part of the hand, pulling at the same time gently downward. With our cow after some three or four times, alternately, "stripping, bunting," and pulling down the teats, as above described, the milk begins to flow—and as much as "Old Flag" may be disposed she cannot stop it after it begins to come. The above management has succeeded with our cow and whether it will with others I leave it to the trial of those who may choose to heed it.

In conclusion I will hazard an opinion. If we would be more kind and gentle towards the *gentle* cow, and particularly in milking, if we would be more careful to avoid hurting her tender soft teats, we should have less trouble in milking and fewer trickery, bad milking, skittish cows. That's all.
West Sidzey, July 1839. B. W. F.

MULBERRY TREES AND THE SILK BUSINESS.

Northampton is certainly one of the great points from which intelligence on this subject emanates.

Many individuals possessing character and zeal are engaged in the work, and have been so engaged for years, and consequently something by this time should be the result of their investigations. We are not wide of the mark when we say that at a large number of mulberry trees are growing in

the State will make it a most lucrative species of employment.

Five or six different individuals are feeding from one to two hundred thousand worms each, and many have smaller quantities; besides the immense number which have already wound their Cocoons.

We state those facts that it may be distinctly understood elsewhere, that raising trees is not the only consideration, but that growing Silk is the ultimate design of those engaged in the business in Northampton. Five or six large plantations of trees were set out this spring, for standard trees, besides those planted last season, with the express intention of allowing them to remain to grow silk; but as the price will remain high this autumn, the silk business cannot get a firm foot-hold until the trees are multiplied greatly, and consequently the price reduced.

We are satisfied the silk business has become permanently established in this country, notwithstanding public scepticism; and farther, that it will ultimately constitute one of the most important products of the agriculturist in the United States.

The South will undoubtedly surpass New England in this matter, because the soil and climate are more congenial to both worms and trees. The southern people, who have suffered so much recently from the fluctuation in the price of cotton, are earnestly seeking out some new crop which will aid them in such emergencies. The land which has been exhausted by tobacco and cotton is just the soil for trees, and the negro children and infirm slaves of both sexes, are exactly suited to picking leaves and tending the worms. It is stated on undisputed authority, that *three millions* of trees have already been contracted for in Virginia, to be delivered in the fall of 1840! a fact conclusive in favor of the silk business.—*Northampton Courier*.

Whitewash your cellars and out buildings.—Last spring we reminded our readers of the advantages of whitewashing, and as we know that some neglected it then, we would again remind them of the advantages to be derived by it. Dog days are at hand when we always have a great deal of close weather, in which diseases are more apt to be generated than at any other season of the year, and during which most insects deposit their eggs. There are also many rainy days, which cannot be employed out of doors: we therefore advise those who have not before whitewashed their cellars and those parts of their buildings which need it, to do it now. By using a wash of quick lime while hot or as soon as it is slacked for this purpose, they will destroy the eggs of insects and do much to remove the cause of infection and effectually close up many places which would otherwise be favorable depositaries for the eggs of insects, and produce a sweet and healthy atmosphere around their buildings.—*Maine Farmer*.

LARGE OATS.—A gentleman took from the field of Mr George N. Powell, three miles west of this city, a sere of oats seven feet and nine inches high,

BOSTON, WEDNESDAY, SEPTEMBER 11, 1830.

THIRD REPORT OF THE GEOLOGY OF MAINE
BY C. T. JACKSON, M. D.

We promised some farther remarks upon this able report. We make them, however, with a good deal of diffidence. A scientific examination of the report is not proposed by us. That we shall leave to other hands. A general and popular knowledge of the principles of chemistry is common enough; but its manipulations and a thorough examination of its subtle processes, require peculiar facilities and advantages, leisure and expense, which few can give to it, and such improvements are constantly in progress, and the boundaries of the science are constantly becoming so much enlarged, that it demands almost the exclusive devotion of one's time and studies to keep pace with it.

All that we mean to do is, to state our difficulties in the way of adopting the theories in respect to vegetation and the use of saline manures, and particularly the carbonate of lime, which have suggested themselves from the statements made in the report itself, and other facts which have occurred to our observation. We should be very glad if these observations should be the means of calling out the learned geologist himself to give us a fuller illustration of his theory; and we shall in all cases welcome him cordially to the use of our columns.

The Dr. remarks in his report, page 123—

"Whoever considers the attempts made to raise wheat upon soil totally destitute of lime, will at once appreciate the value of that mineral substance and its importance in the production of grain. An imperfect or blighted produce is sure to follow the planting of this grain upon soils destitute of lime, while it is well known that certain districts where the soil contains this mineral are always favored with luxuriant and heavy crops. This is one of the settled points in agriculture, and one which every farmer should duly appreciate, if he wishes to prosper in his art. Indian corn requires but little if any lime, and hence we see excellent crops of that grain raised upon sandy plains, unsuited to wheat."

Professor Hitchcock says, ("Economic Geology," page 52.) "The grand desideratum in our soils is calcareous matter, that is, the carbonate of lime."

We are not about to deny the utility of lime in agriculture. It would seem that this point is determined; but that it is indispensable in the form of a carbonate—that without it our wheat is "sue" to be blighted, and that soils containing this mineral "are always favored with luxuriant and heavy crops," are points not so well established. Let us see how certain facts well attested, bear upon the case. We must necessarily present the matter in an irregular and desultory form, because our time and situation in travelling and away from home, forbid any other course.

Dr. Jackson says that these are all settled points in agriculture. But it is a fact that there is great disagreement among chemists themselves in regard to the mode of the operations of lime. Dr Dana considers the form in which it is found in the soil, whether as a sulphate, phosphate or carbonate of lime, of little or no importance; and that a bushel of wood ashes in its power of converting insoluble into soluble gine or the food of plants, is fully equal to a cask of lime. Sir Humphrey Davy, maintains, (Lectures, p 284.) "that chalk and marl, or the carbonate of lime, will only improve the texture of the soil in its relation to absorption; it acts merely as one of its earthy ingredients." "The operation of quick lime and marl or chalk, (carbonate of lime,) depends

on principles entirely different." It would seem likewise, from a remark of Professor Hitchcock, that he himself is not positive as to the particular form in which the presence of lime is essential to the success of cultivation. In the passage first quoted, he says the carbonate of lime is the great desideratum in our soils, but on page 48 he says, "I doubt not many a crop has failed from the want of that one per cent. of sulphate or phosphate of lime. Facts indeed seem to me to warrant the conclusion, that without lime in some form, land will not produce any valuable vegetation."

It is a curious fact in this matter, to which we may conveniently advert here, and seems to have surprised both of the learned geologists, that even the limestone soils, "that is, soils lying above limestone and full of the outcroppings of lime in the form of a carbonate, should contain no more of the salts of lime than other parts of the State." Prof Hitchcock here refers to the soils of Berkshire county. Dr. Jackson says, likewise, that "it is an interesting and curious fact, that the soils of Thomaston, so celebrated for its lime quarries, should be wanting in lime." Prof Hitchcock suggests a theory which we beg leave to state respectfully, is wholly unsupported by evidence, and in which we have no faith; "that the calcareous matter which the soil once contained has been exhausted by cultivation." But Dr Jackson in his analysis of the Thomaston soil, (p. 152) showing that it contained carbonate of lime only 0.2 in 100 parts, adds that "this soil was selected from the midst of a grove, where it had never been cultivated."

It would seem in the next place that lime is not entirely wanting in any of our soils. The domestic fowls when left at liberty, and the birds find no difficulty in obtaining all that is required for the shells of their eggs. The bones of all animals are mainly composed of it. It is found to a certain degree in all plants and in almost all animal manures. Prof Hitchcock says, "in respect to the sulphate of lime or gypsum, it may not be unexpected that we should find it in all soils, since we know it to occur in all natural waters throughout the State.— Again, the sulphate and phosphate of lime were found in greater or less quantity in every soil analyzed. There is strong reason to believe that this salt is a constituent of all soils in their natural state." Vegetables of various descriptions contain phosphate of lime. Indian corn, according to Prof. Gorham, contains 1.5 per cent. phosphate and sulphate of lime. Rice, wheat, barley, rye and oats all contain notable portions of phosphate of lime, not only in the grain but in the straw." The dung of cows and of horses contain portions of phosphate, carbonate and sulphate of lime. The clays of Massachusetts and all argillaceous slate soils contain carbonate of lime. Now whether we have enough of this ingredient in our soils for the purpose of ripening our crops, or whether our occasional failures be owing to the deficiency of this calcareous matter in our soils, is a matter in whose determination facts are vastly more important than theories, which, to say the least, are imperfectly established. Let us look at some of these facts. First then, throughout the State wheat is almost invariably raised with success and abundantly on new lands, recently cleared, and where the wood or brush has been burnt and the ashes left upon the soil. This fact we believe will not be questioned. It is equally well established that in the first settlement of our country, like the State of Vermont for example, whose clearance is within the memory of many now living, wheat was as common and certain a crop as any which was cultivated; and in those places where now the farmers complain that they cannot raise it, or rather only occasionally succeed. Second, the farmers on Long Island, N. Y., feel so confident of success with their wheat if

they can obtain leached ashes, that they are willing to go to an expense of twelve cents a bushel in order to obtain them for their wheat crops. If lime would have furnished an efficient substitute, they would long since have ascertained it, and saved themselves much expense and trouble. It may be said that there is always a portion of lime in leached ashes; but this is certainly not the particular ingredient on which they depend, or they would have discovered it by the repeated trials which they have made. A third fact in the case is, that large crops of wheat are often raised upon soils where the carbonate of lime is not found. This is the case with the alluvions on Connecticut river, where thirty and forty bushels of wheat to the acre have been repeatedly obtained. One of the best wheat districts in Massachusetts, where it has been cultivated for years with general and almost invariable success, is West Newbury, Essex county. No carbonate of lime has been discovered here. Upon the farm of Mr Adams, in Chelmsford, an alluvial soil on the Merrimack river, wheat has been raised successfully at an average rate of thirty bushels to the acre for twenty years in succession with but a single instance of failure from any cause. Upon the chemical analysis of this soil by Dr. Dana, it was found not to contain a trace of the carbonate of lime. Such an instance as this thus fully established, is as good as a thousand to disprove the position that the carbonate of lime is indispensable to the production of wheat. (See the Second Report of the Agriculture of Massachusetts, Appendix.) But it may be said in this case that the portion of lime needed was furnished by the manure applied. The manure itself came from the products of the land. It follows then most clearly that where the manure is returned to the soil, there can be no exhaustion of the ingredient necessary to the production of wheat. Indeed the doctrine suggested by Prof. Hitchcock, that our soils have been drained of calcareous matter by cultivation, where the land has been enriched by its own products, is not, in our opinion, likely to find much favor. The amount of lime or silic acid in any plant is a very inconsiderable matter; and until the earth can be rendered volatile and made to assume a gaseous form, it is difficult to conceive of their being carried away. The suggestion of Sir Humphrey Davy that an acre of clover or sainfoin would, if reduced to ashes, yield three or four bushels of gypsum, requires other proof than has yet been furnished to render it credible. A fourth fact, and a very curious one, is stated by Professor Hitchcock, which is, that on an examination of five of the most productive of the rich soils of the Western States, it appears "that although they are of the very first quality, the superiority of the western soils over those of Massachusetts (in respect to the salts of lime) will not appear as great as is generally supposed." Five analyses are given. Carbonate of lime is found in them in these proportions: 1.5 per cent., 1.3, 3.3, 2.8. In seven of the Massachusetts soils where the carbonate of lime is found, and two of these are from limestone soils, the proportions in which this form of lime is found are as follows: 1.3 per cent., 0.8, 3.2, 3.0, 2.1, 0.4, 2.0. But in respect to the presence of lime in the form of a sulphate or phosphate, the Massachusetts soils can hardly be said to be inferior to the western soils, from the tables given in Prof. Hitchcock's report. Indeed they present a greater average proportion. In the fifth place, there is wanting the proof from facts that the application of lime to the soil in any form in Massachusetts, has been sure to secure a crop of wheat, according to the statement of what Dr Jackson pronounces a settled point in agriculture.

The application of lime to the seed of wheat after it has been steeped in brine, is an established remedy

against the smut in wheat; but whether in this case it is the lime or the brine or the combination of the two, is not so well determined. It is settled that rinsing the seed in pure water and then applying lime is not effectual. A case likewise has not come under our observation, where when the wheat has been washed with brine and then sprinkled with gypsum or ashes, the smut has followed! But in all the inquiries we have made in respect to the application of lime to the soil, whether in the form of quick lime or mild lime (carbonate of lime,) a single case has not come under our notice, where as well as we could judge, it has been proved effectual against blight; not a single case in which its efficacy in any form has been so marked and signal in respect to the crop that the farmer has been able to say confidently, "the lime has done this." We of course speak only of trials which have come under our observation. These have not been few. We wish the farmers would furnish us with other facts in the case. The application of the marls the last year in Berkshire was, we believe, a universal failure.

We know very well how imperfectly and carelessly experiments of this nature are made; and therefore are far from considering the case as decided. We regard ourselves only as inquirers in the matter, and shall keep our minds open to farther light. In the mean time we submit these considerations to persons interested in the subject, and shall continue it on another occasion.

H. C.

HORTICULTURAL SOCIETY IN LOWELL.

We are gratified to learn by the Lowell Journal, that a Horticultural Society has been recently formed in that place. A society of this description should be organized in every town in the State, however small it may be. An association of individuals for the purpose of introducing choice fruits and flowers, and for protecting them after they have been introduced, would produce a great revolution in the character of our fruits, as well as increasing the quantity, which is at present far too small for the population, as well as inferior in quality.

If every landholder would set out a few choice fruit trees about his house, there would soon be no inducement to the thieving scamp to rob his neighbor's garden, as all would be supplied. We have been pained to learn from cultivators in various places, that they are obliged to gather their pears, plums, peaches, and other choice fruit prematurely, or they are stolen. We hope the example of Lowell will be extensively followed.

J. B.

BRIGHTON MARKET.—MONDAY, Sept. 9, 1829.

Reported for the New England Farmer.

At Market, 400 Beef Cattle, 650 Stores, 4000 Sheep and 420 Swine. Several lots of Sheep and a few Beef Cattle unsold.

PRICES.—Beef Cattle.—We continue our quotations without much variation. First quality, \$3 25 a \$8 50. Second quality, \$7 50 a \$8 00. Third quality, \$6 50 a \$7 00.

Stores.—Yearlings \$12 a \$16. Two Year Old \$18 a \$28.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded Northern exposure, week ending September 8.

HORTICULTURAL EXHIBITION.

The annual exhibition of the Massachusetts Horticultural Society will be held at the Society's Rooms, No. 23 Tremont Row, (nearly opposite the Savings' Bank) on Wednesday, Thursday, and Friday, the 23th, 24th, 25th September instant.

The Members of the Massachusetts Horticultural Society and the public generally are respectfully invited to contribute choice and rare specimens of Fruits and Flowers for the Exhibition, and to send the same to 23 Tremont Row, on Monday or Tuesday, the 23d and 24th inst., where Committees will be in attendance to receive them, and will retain the same subject to the order of the contributors.

Contributors of Fruits and Flowers are respectfully requested to send a list, with their specimens, giving the names of all the varieties presented.

Season tickets, and tickets for a single admittance, may be had at the door during the exhibition.

By order, SAMUEL WALKER, September 11. Chairman of Com. of Arrangements.

Massachusetts Horticultural Society.

The members of this Society are hereby notified that Saturday next at 11 o'clock has been assigned for the choice of a Committee to nominate officers for the year, beginning on the 5th of October next.

And the members are also hereby notified, that on Saturday, the 5th of October next, at 11 o'clock, A. M. at their hall in Tremont Street, the officers of the Society for the ensuing year, will be elected, viz. a President, four Vice Presidents, a Treasurer, a Corresponding Secretary, a Recording Secretary, a Council, an Executive Committee, and Standing Committees on Fruits, Flowers, the Synonyms of Fruits, the Library, and on Finance.

R. T. PAINE, Corresponding Secretary and ex officio Recording Secretary pro tempore.

Boston, September 11.

Morus Multicaulis Trees from Seed.

The subscriber offers for sale 10,000 trees produced from seed of the genuine Morus Multicaulis. The seed was raised on his premises in 1825; the trees have been multiplied for the two last years by layers, their growth is more rapid than the original tree, and appear to be sufficiently acclimated to endure the winter, some of them having been left standing in the open field unprotected during the two last winters without any essential injury. The leaves are very large and equal in quality to any other kind for feeding the silk worms. Those who are wishing to purchase a superior kind of Mulberry are requested to call and examine for themselves, before the foliage is destroyed by frost.

CALVIN HASKELL.

Harvard, September 11.

MULBERRY TREES.

The subscriber has on hand a quantity of Mulberry Trees of a quality which is probably superior to any kind ever introduced into this country. They were imported four years since and though they have sustained the rigorous cold of the last three winters entirely unprotected, yet it is believed a Southern or Italian genuine would be more admirably adapted to their growth and propagation. Their foliage is most luxuriant and affords more nourishment than any other variety. Silk produced by worms fed with the leaves, has been pronounced by judges to be the best ever manufactured by them, and decidedly superior to the best Italian. A few thousand will be for sale if immediate application is made to the subscriber, whose specimens may be seen at Mr. Morus Multicaulis and Agricola.

PROVISION MARKET.

ILLINOIS.

A correspondent of the New York Observer gives the following attractive description of the face of the earth and mode of tilling it, in a section of the state of Illinois.

In travelling through Illinois, from Quincy to Springfield, and thence to Chicago by the way of Peoria and Ottawa, I did not notice a single swamp, large or small; and I cannot recollect that I saw an acre of really waste land in any one place. But suppose the whole state to contain a million of acres of such land, there is then no less than *thirty-seven millions* fit for cultivation; and by far the greater part of it, of the very best quality. I have not a single doubt that Illinois, alone, is capable of sustaining a population of *twenty millions*. Forty-five bushels of corn to the acre, is less than an average crop; and with better cultivation it might be increased twenty per cent. Put *fifteen millions* of acres into corn, and then multiply it by *forty-five*, and see what it will amount to. Put *ten millions* more into wheat, and estimate the average product at the very moderate quantity of twenty bushels to the acre, and it gives you 200,000,000 of bushels per annum. Then you have *thirteen millions* of acres left for rye, barley, hemp, farinaceous roots, grass, timber, &c. Would it be strange, if before the thousand years of the millennium shall have half rolled away, Illinois, with such an extent of territory, and such a soil, should feed and clothe thirty millions of people? Missouri is nearly as large as Illinois, and also supposing the curse of slavery to be removed, (as I am sure it will be) is capable of sustaining nearly as dense a population. And then there are all the other great and fertile states of the valley, besides the immense unexplored regions, perhaps equally fertile, up on the tributaries, and about the sources of the Missouri and the Mississippi.

One of the reflections which forced itself upon my mind in travelling through a little of the West, and having before my eyes from day to day proofs of its extraordinary fertility, and of the little labor which it requires to produce a redundancy of food, was, that these immense regions were intended and reserved chiefly for the millennium. The land is far too good for man, with those indolent and depraved propensities in full strength, by which he has been hitherto governed. Indeed, the two greatest objections to the west, in my judgment, are, that the land is too cheap and too productive. Taking human nature as it is, however; industrious and virtuous emigrants from the scanty and rugged soil of New England may be, they must in general, without a miracle to prevent it, degenerate when planted down upon the fat valleys of the Scotia, the Wabash, or the Illinois. It is a law of our lapsed natures, not to work if we can help it. Ninety-nine out of a hundred persons will throw off just about as much of the primitive curse as they can. If the labor of five days in a week is sufficient to support them they will not work six. If they can live upon the product of two days, it is vain to expect them to work three; and if they could subsist comfortably in any other way, they would not work at all. Where the laziness of the boy has been counteracted by early habits of industry, and the man has spent many of the best years of his life in hard labor, under that iron-headed task-master necessity, he may carry his habits along with him, and continue to moisten the soil with the sweat of his brow, from

the mere love of action and regular employment. But I was told over and over again, when I was passing over those rich lands of promise, that after a while, the great majority of the Yankees, as they call them, who had been most laborious at the east, relax and fall into the habits of their neighbors. Now if this is the case, even with the fathers, what can we expect from their children, but that they will be *just as lazy as as they can be*—that is, as the soil and climate will allow; and if idle, then vicious, almost as a matter of course—for there never was a truer saying than that of 'the ancients,' that an idle man's brain is the devil's workshop!

What then is the actual condition of a farmer who goes out with moderate means from Massachusetts or New Hampshire, and settles down upon a good section of land, wood and prairie, in Illinois? The first thing is, to fence as much of the prairie as he wants for immediate cultivation. The next is to plough it; which, if he does not happen yet to have a sufficient team of his own, he can hire done for two dollars and a half or three dollars an acre. If he wants to get a crop of corn the first summer, he has only to follow the plough, and drop the seed in every third furrow, to give him from fifteen to twenty-five bushels to the acre, without going into the field again till harvest time. I saw a great deal of corn, as I passed along, thus springing up between the furrows. The ploughing, however, must be delayed till the grass is quite grown, otherwise it will turn and spring up through the sod, and you will lose your labor. The breaking up requires three or four strong yoke of oxen, and is done in this wise.

The beam of the plough is framed into an axle, and so ganged as to cut a furrow eighteen inches wide and four inches deep. The wheel for the furrow is four inches larger in diameter than the other, so as to keep the bottom of the plough perfectly flat. Thus prepared and once put in motion, it requires no one to hold it, except where the sward is very deep and tough. I noticed one plough at least, going without hands, and I never saw a handsomer furrow cut in my life. It takes about two years for the turf to become thoroughly pulverized, and then the land is tilled with as much ease as if it had been under cultivation a hundred years. One man, with two horses, will take care of forty acres of corn, as it requires no hoeing, and if the season is favorable it will yield him 2000 bushels. With this he can fatten a great many swine, besides feeding a large stock of cattle through the winter.

Wheat and all other grains may be raised with about the same ease.

The open prairies serve him both for pasturage and mowing, and the less he owns the better; because large tracts will for a long time remain in common field, which he can have the use of, without paying taxes. A friend of mine has planted himself down on the margin of one of these prairies where, as he told me, he could fatten five hundred or five thousand cattle, if he had them. The young prairie grass is said to be exceedingly nutritious; and I am sure I never saw cattle look finer, in any of our white clover pastures.

BERRY STAINS.—A friend requests us to state that a teaspoonful of oil of vitriol mixed in a cup of water, will without fail remove any berry stains from garments without injury to the cloth.

Hate's Patent Horse Power and Patent Threshing Machine.

JOSEPH BRECK & CO offer for sale this valuable machine and feel great confidence in recommending it as the best machine now in use. It will thresh from 75 to 100 bushels per day in the best possible manner. The horse power is calculated to propel any kind of machinery, is very simple in its construction, occupies but the small space of one foot by two, and can easily be transported from one place to another, and when combined with the Threshing Machine it forms the most superior article for the purpose of investment. They can be supplied at short notice at the N. E. Agricultural Warehouse and Seed Store, August 23.

New York Urat and Poudrette Company.

Not incorporated but carried on by individual enterprise. The manures are not divided among the Stockholders, as are those belonging to another establishment, but sold to applicants, for each an delivery. Orders are supplied in the order of time in which they are received. Urat 50 cents and Poudrette 30 cents per bushel, with contingent charges for bags or barrels, &c.

This company are daily preparing for use, during the warm dry weather, the materials collected during the past winter, and will have several thousand bushels ready before the first of October next. The material is disinfected and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1838 and 1839, on Long Island, has satisfied many of the farmers that the manures have the greatest operation upon vegetable matter, producing greater abundance, and the cheapest of any manure they have ever tried.

Ample instructions for their use, the result of practical experience, will be furnished on application. The effect of Poudrette upon *Grass Vines* and *Morus Multicaulis* is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manures, and farmers and gardeners may confidently rely on a supply.

Orders, post paid, directed to "The New York Urat and Poudrette Company," Box No. 1211, Post Office, New York, or sent to the store of STELWELL & DEY, No. 365 Fulton Street, Brooklyn, will be attended to.

The Company will be very glad to oblige and to gentlemen who have used the manures, to give their statement in writing what has been the result of their use and experiments in relation to them.

New York, August, 1839.

Multicaulis, Alpine and other Mulberries.

WILLIAM PRINCE & SONS, proprietors of the Linnaean Nurseries near New York, are ready to receive orders to any extent for all the varieties of Mulberries, including the Chinese Multicaulis, Americana Multicaulis, raised from seeds and very hardy, Exsapa, Eldata, Alpine, Canton, Broussa, Rese of Lombardy, Danolo, Pyramidalis, &c., the six first named of which surpass all others and are placed in rotation according to merit. The prices will be moderate and terms easy, and priced Catalogues will be sent to every one desirous of purchasing Fruit and Ornamental Trees and Shrubs, Green House Plants, Bulbous Flower Roots, Field and Garden Seeds, Rohan Potatoes, &c., can be supplied, and priced Catalogues will be sent to every applicant.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

NEW ENGLAND FARMER.

[EXTRA.]

PUBLISHED BY JOSEPH BRECK & CO., NO. 52 NORTH MARKET STREET, (AGRICULTURAL WAREHOUSE.)

VOL. XVIII.]

BOSTON, WEDNESDAY EVENING, SEPTEMBER 11, 1839.

NO. 10.

From the Albany Cultivator.

THE CIRCUMSCRIBED FARMER,

We mean such as possess a limited capital, and limited desire for improvement, except in their own way, often decline taking an agricultural paper, because it teaches nothing, they say, that is adapted to their practice, or that is graduated to their scale; because, in fact, it is not oral, and delivered by word of mouth, but has been subjected to the operation of the printing press.

Let us ask these gentlemen, if they were disposed to have their son learn a trade, or to become a first rate farmer, would they select a teacher of circumscribed knowledge, who followed the practices of the last century, or knew only how to *kill land*, or one who was familiar with all the improvements of the age, and whose thrift in business would be a guarantee that he worked it *right*? Now the agricultural journal is to the circumscribed farmer what the good teacher would be to the boy—an instructor in the improvements and best practices in his business—written by those who have made and adopted them, and have profited by them—and for the particular benefit of those who have limited means, or cannot go abroad for the information they need. The modern improvements in farming go to economize labor, or rather to render labor more productive and profitable, and to keep up the fertility of the soil—two objects of as much or of more importance to the circumscribed farmer, than it is to the one of more extended means. The man who takes an agricultural journal profits by the experience of hundreds; while he who takes none, an profit alone from his own, and from that of perhaps a few neighbors. The adage teaches, that two heads are better than one, the world over.

These remarks are preliminary to some extracts we are about to make from John Lorain, a philosopher and a first rate farmer, written for the special instruction of circumscribed farmers, to whose notice they are respectfully recommended:

"In this country land is very cheap: an excellent ready cash market for the produce of the soil generally prevails. This offers every rational encouragement to the poor but industrious farmer, who depends principally on his own labor and that of his family for cultivating the soil occupied by him. He is but little affected by the high price of labor, or the idleness and insolence of workmen, which take place in every country where labor is scarce, unless the laws be oppressively severe.

"The principal reason why this class of farmers seldom become wealthy, and but too frequently continue poor, is the desire of immediate returns on cropping, and the mistaken idea that the prof-

ploughing and cropping can effect this ruinous purpose, the grounds rest with no other covering but that of some scattering and debilitated grass and weeds. This exposes the soil to the very injurious action of the sun, wind, washing rains and melting snows. When such grounds are ploughed for crops, instead of being richly stored with grass roots, and well covered by their tops, scarcely any vegetation is found to replenish them, or to nourish the crops grown on them.

"These ruinous practices naturally introduce poverty of soil, and its inseparable companion, poverty of purse. This, however, is not all: it entails on posterity the wretchedness introduced by their inconsiderate forefathers, or an Herculean task to counteract the curse of poverty which their negligence had introduced. Whether Satan is also the instigator of this evil, I do not presume to determine, but certain I am, that it is much greater, (so far as farming is concerned,) than the curse entailed on the soil by the fall of Adam. That seems to consist simply in brambles and thorns, including in these, such other vegetation as would compel man to earn his bread by the sweat of his brow. This curse we may all see is irrevocable, but we may also at the same time observe, that if man complies with heaven's mild decree, and removes those obstacles to the growth of plants which better suit his purpose, agriculture flourishes, and his rational wants are abundantly supplied.

"But when the hand of folly introduces the additional curse of poverty on the soil, this insatiable monster, like Aaron's serpent, swallows all the rest. Even brambles, thorns, &c. (the mild chastisement of heaven,) cannot prosper where poverty has obtained dominion over the soil, as may be readily seen, for this and every other vegetation grown on such grounds, looks sallow, starved and debilitated.

"That man is inexcusable, and ought to be punished for this sin against common sense, himself, his posterity, and the community in which he resides, is evident.

"Before this inconsiderate being enters the forest, glade or prairie, nature had been for ages enriching the soil for his use, in the way that has been described. The fertility of it might be preserved and increased, even by the circumscribed farmer, if a system of agriculture calculated to keep the ground fully replenished with decaying animal and vegetable matter was practised, and due attention were paid to the augmentation of live stock, in proportion to an increase of ability, instead of the ruinous practice of perpetual ploughing and cropping.

"Reason alone, demonstrates this interesting fact. It has also been clearly proved by actual

come wealthy, although their mode of management was very inferior to that which has been proposed. They, however, increased their live stock in full proportion to the means furnished by the system of management employed by them.

"From first to last, they have been enabled to live better, and vastly more independently than those who relied principally on the plough. The cause of this is evident: milk, butter, cheese, wool, meat, hides and manure, are continually increasing. It is evident that but little manure can be obtained in the beginning; however, where that little is spread, the product is greatly increased, as is also the fertility of the soil for a succeeding crop and the grasses following it. Where a plenty of good grasses and hay prevail, young cattle will grow as much or more in one year, than they do in two when kept on pasture, fed bare during summer, and on straw through the principal part of the winter.

"It is considered proper to remark that, although many circumscribed farmers make considerable progress in increasing their live stock, their laudable enterprise, however, is too often suddenly checked, before they obtain half the number of domesticated animals necessary to the proper cultivation of their grounds.

"This evil originates in the prevailing error that huge piles of stone and mortar, or boards and scantling, are the best means that can be pursued by the cultivator to improve his farm. Hence it is, that we see almost in every part of Pennsylvania, where it is possible to effect this mistaken improvement, extensive barns and dwelling houses standing on farms, where we do not observe half the quantity of grass or number of cattle necessary for the proper cultivation of the surrounding soil."

THE NORTHERN SHEPHERD,

Is the title of a 12mo. volume sent us by the Kennebec Agricultural Society, for which we tender our thanks. It is a report made to that society by a committee appointed for the purpose, upon the diseases and management of sheep. It is divided into three parts, the first on the management of sheep, prefaced by a short description of the various kinds among us; the second on the diseases of sheep; and the third miscellaneous. From the cursory examination which we have been able to give to the work, we think it will serve as a valuable companion to the sheep-master and shepherd.

There are some general principles laid down and inculcated which we think important ones, and which we propose briefly to notice; and although we do not intend to go into an argument to prove them to be sound, we think most of them are so

The South Downs seem to rank next to the Marino, as having the next finest fleece, as affording excellent mutton, and as possessing a hardness of constitution, and a vigor and activity, which enable them to support and to thrive upon bleak and barren hills, where the Dishleys would die from exposure or starve.

"*Sheep should not be kept too high,*" says the report, "unless intended for the butcher; for it is believed to be a true maxim in regard to them, 'once fat and never fat again.' If they once become fat and are suffered to fall away, it is difficult getting them so fat as they were before they began to grow poor." p. 27.

"*High rocky pastures are much the best for sheep.*" "Nature, it seems, designed the sheep originally for a mountain animal; and although man has by art changed its nature in a surprising degree, yet he has not been able wholly to thwart her views, and the sheep loves still to feed on the hill top and cliff, where there is a pure and exhilarating breeze, and where it can shelter itself under the shade of trees, or a projecting rock, during the heat of our sultry dog-days. A high pasture should therefore be devoted to your sheep."

"*Salt and tar should be given to sheep.*"—A piece of salt may be laid in a trough, and the sheep will lick it as they please, and if some tar be added to the salt, it will be a benefit to them, as tar is a very good stimulant when taken into the stomach, and it prevents annoyance from the different species of flies." We would recall to the recollection of the reader, the mode of administering these as practised in Spencertown, and published in our second volume. A log is hewn upon one side, which is then turned uppermost. It is then perforated upon the hewn side with holes made by a large auger, two or three inches deep. The holes are then filled with salt, and the hewn surface smeared with tar. In obtaining the salt, which the sheep are permitted to do as often as they desire, their noses become daubed with tar, which prevents the fly from entering the nostril.

"*Shelter during stormy weather,* at all seasons, is considered indispensable to the health of the sheep, particularly after they have been shorn. "So tender and delicate is the skin of the fine woolled sheep, and so close are their fleeces, that there is great danger of pelt-rot being occasioned by too great exposure to the chilling influence of long and cold storms."

"*Sheep should be brought to the barn in autumn in good order.*"—They are thus fitted to withstand the rigors of winter much better, and they will be carried through this inclement season with much less care and more economically than they can be if they are poor and emaciated when winter sets in." This is true of all farm stock.

"*Sheep require the stimulus of distention*—they should be filled with something that they will eat. When fed upon green grass, a sheep consumes eight pounds a day. If this grass is converted into hay, it weighs but two pounds, and the two lbs. constitutes its winter ration. To ensure health, the six deficient pounds should be made up in water, vegetables or other food.

"*Pine or hemlock boughs,* are recommended to be given to sheep in winter. "I have for near thirty years," says the writer of a part of the report, "made use of hemlock boughs as the cheapest green food." It may be added, that the resinous qualities of these boughs, promote the health of the animal and prevent disease.

"*Sheep should not be turned to pasture too early in the spring*—for it takes their appetite from their fodder, and as they cannot graze enough to fill them, they lose flesh fast."

"*Sheep should not be crowded in sheds nor huddled together in one spot too long*—"as that," says the book, "I am confident has produced disease in my flock. In one instance, I have no doubt the pelt-rot was thus produced, and nothing saved the whole flock from the scab but a timely application of oil to the sheep."

"*Open sheds are the best shelter for sheep.*"—If kept dry, the wind is desirable, though cold. It preserves the purity of the air, and promotes health.

Under the treatment in March it is remarked,—"Take good care of your sheep this month, that they may be able to bring forth their young the better during the next." And under the treatment for April it is urged, to "make the sheep eat as much green food as possible each day. Grass is the best if you have it; next to that, potatoes. This month tests all the rest, as regards ewe sheep, for he who raises the greatest number of lambs from a given number of ewes, is supposed to be the best shepherd, all other things being equal."

We pass over the second part of the work, which treats of the diseases of sheep, and content ourselves for the present with making the subjoined extracts from the miscellaneous part.

"*Salt.*—I have mentioned that salt was considered by the Spanish shepherds as essential to the health of sheep, and this sentiment is very general in every part of Europe except England, whose situation renders the air sufficiently salt. The same consequence from similar causes takes place here. Upon Long Island and elsewhere near the sea, the cattle require no salt, nor manifest a desire for it; whereas north of the Highlands, they eat it ravenously, and it is thought essential to their health. The ancients also entertained similar sentiments upon this subject. Aristotle prescribed one peck every five days, during the summer, to one hundred sheep. We should consider this a large allowance, but it would be readily eaten. They also observe, that, however good your pastures may be, the sheep will tire of them if not changed, unless their appetites are kept up by salt."

"*Transitions from high to low food.*"—With all stock it is allowed to be very dangerous to pass very suddenly from high feed to that which is scant and poor; or from plenty of green food to that which is altogether dry. Hence arises a very important maxim in respect to sheep; which is, as soon as the pastures fail towards the end of autumn, to put them to turnips or cabbages, if we have them; and this will perhaps be found our best system with respect to turnips—so sow a sufficient quantity for our sheep, to be eaten after the grass fails, and before the snow falls, so as permanently to cover the ground."—*Cultivator.*

From the *Genesee Farmer.*

METHOD OF USING THE CHLORIDE OF SODA.

A translation of A. G. Labarraque's method of using the chloride of soda, has been kindly sent us by Jacob Porter, the translator. This chloride is the most powerfully disinfecting agent known, and has been found of great use in dressing ill-conditioned sores, and as a means of purifying unhealthy places, and disinfecting animal substances. It is sold in a liquid form, at the apothecary's, by the bot-

tle. It is used diluted with water. A bottle of the liquid, which costs but a few cents, will serve a family sometime, for disinfecting the air of vaults and other foul places about dwellings, purifying the air in sick chambers, in cellars, &c. Its great utility in lazarettos and hospitals and, in Asia, in preserving from the plague, seems to have been tested and proved by officers of the French government. At this season, it is peculiarly beneficial. We subjoin some of the directions for its use.

"For ill-conditioned ulcers let a glass of the chlorated liquor be mixed with five times its quantity of pure water, and in this mixture dip the lint with which the ulcers are to be dressed. The dressing should be applied twice a day. If the sore become red and inflamed, this mixture should be still further diluted; if, on the contrary, the sore does not change its appearance, it should be dressed once or twice with some chloride with only half its quantity of water, so as to bring on a slight inflammation, which is indispensable for causing atonic ulcers to pass to a state of simple sores. The healing will then go on rapidly. At the time when the chloride is applied to the ulcer, the fetid smell is destroyed.

"Gangrene, hospital putrefaction, ill-conditioned burns and scalds, old syphilitic ulcers, corroding herpetic affections, and the like, should be treated in the same manner.

"Cancer in a state of suppuration may be disinfected with some lukewarm or cold water, containing a twentieth of the chloride of soda.

"For ulcerations of the nasal organ, the throat, the palate and the gums, the chloride should be diluted with eight or ten parts of water. I will, nevertheless, be necessary to touch these sores with a little lint moistened in some pure chloride.

"For the scald head, the chloride should be mixed with only an equal quantity of pure water, and the parts affected be moistened with this liquid twice a day.

"Great advantages have been obtained from using the chloride very much diluted in water, for all the purposes of the toilet. In a dose of from 25 to 40 drops [not to be taken internally,] it acts as a bracing and preserving wash, prevents the spread of herpetic eruptions, and cures certain diseases of the skin.

"The air of sick chambers, and the patients themselves, may be purified by mixing a spoonful of the chloride and six spoonfuls of water in a plate, and setting it under the patient's bed, indeed several plates with the diluted chloride may be placed in the same department if necessary. In this way the exhalations may be destroyed as soon as they are produced. It will be necessary to renew daily the chlorated water contained in the plates.

"In all places where there is a crowd of men or animals, whether sick or healthy, the air becomes corrupted, and acquires deleterious properties, owing principally to the animal exhalations. These exhalations may be destroyed by sprinklings of the chloride, diluted in from 25 to 30 parts of water; or by setting in these places (and they may be out of sight), some vessels containing the chlorated water, which can never be in the least injurious, whatever may be the quantity. This method of purifying the air is indispensably necessary in lazarettos, hospitals, prisons, poor houses, manufactories, churches, seminaries, convents, halls of study, and dormitories in colleges and boarding-houses, cabins of ships, court rooms, crowded theatres, saloons filled to excess on great occasions and the like.

"Sprinklings of the chlorated water will be more especially necessary whenever an epidemic or contagious disease prevails: they should be made in order to guard against the deleterious influence arising from the neighborhood of marshes, the rotting of flax, hemp and the like. They will likewise be serviceable in the diseases of domestic animals, in places where silk worms are raised; finally, in all places where the air becomes charged with exhalations, which, on being accumulated, produce fatal effects.

"In cases of asphyxia, produced by the exhalations, of vaults, sewers, or any considerable masses of putrefying animal substances, it will be necessary for the patient to breathe the concentrated chloride; and his chamber should be sprinkled with the chlorated water, so as subject him to the influence of the disinfecting agent.

"It is often necessary, sometime from a tedious feeling of regret, to preserve for a long time the bodies of deceased persons. A fetid odor appears more or less readily, according to the temperature of the air, the state of the patient's body at the time of his decease, or the disease that terminated his life. This decomposition may be suddenly arrested; indeed, it may be prevented by sprinkling the body with some chloric diluted with water. For this purpose a bottle of chloride should be mixed with twelve bottles of water: in this mixture a linen cloth should be wet, laid on the body, and sprinkled occasionally with the liquid."

NUTRITIVE QUALITIES OF CHARCOAL. Though the importance of mixing charcoal with the food of animals, particularly that of swine, has been generally acknowledged, and its benefits extensively tested, still it has been supposed that it only acted as a corrective to the acid tendency of food, and facilitated fattening, by improving the health of the animal. Some experiments are, however, on record, which would seem to show that charcoal acts a more important part in the matter, than has usually been assigned to it.

In 1793, a family being driven from New York by the fever, were absent six or eight weeks before it was deemed prudent to return. A number of fowls confined in a loft in the workshop of the house were forgotten at the time of leaving, and as it was known that there was nothing provided for their subsistence, it was expected on the return, they would be found starved to death. To the astonishment of all, the fowls were found alive and fat, though there was nothing upon which they could have fed, except a quantity of charcoal and shavings; water being supplied from the grindstone trough.

These facts coming to the knowledge of a gentleman in New York, as we learn from the Recorder, he instituted the following experiment. He placed a turkey in a box or enclosure, 4 feet long, 2 feet wide, and 3 or 4 feet high, excluded light as much as could be done, and allowed a free circula-

Several years since, in fitting out one of the Liverpool traders at New York, a pig on board was missing, and was supposed to have been lost. The cargo was taken on board, stowed, and the vessel sailed. It was now discovered that the pig was alive in the coal hole, but as he could not be got at readily, it was concluded to leave him to his fate. He remained in this retreat until the passage was made, when his pigship was found to be not only alive and well, but materially improved in condition, though there was nothing, coal excepted, he could have swallowed.

When it is remembered that wood, sugar, and several other substances, some of which are most nutritive, are compounded of nearly the same original elements, it would seem possible, by animal chemistry, to convert them to the purpose of sustaining life; though all experiments with wood or charcoal have failed. The German chemists have converted wood into very palatable bread, by roasting and pulverizing; but calcination, it has been supposed, would destroy whatever powers of nutrition wood might originally contain. The chemical action of vegetables seems unable to produce the least effect on coal, and not the least particle of it has ever been found in the structure of vegetables, though mixed with the earth and water in which the plants are growing, in the form of the most impalpable powder. Whether animal chemistry is able to do what vegetable organization cannot, remains to be seen; though if there is no mistake in the statements alluded to, it would seem probable that this intractable substance, is, in some way made subservient to the nutrition of animals.—*Genesee Farmer.*

How to make agricultural pursuits pleasant as well as profitable.—For ages the employment of the husbandman has been looked upon as dull, uninteresting work. It has been thought to be a dull, plodding occupation of the hands and not of the head. And there has been too much foundation for such an impression. The agriculturists of years not long by-gone, did little with the head to dignify or enliven the work of the hands. A change for the better seems now near at hand. Perhaps in your day, farmers may be generally more intellectual, more intelligent, and more able to bring the truths of science to benefit them in their manual labors, and to give them interest and delight in their occupations. But whatever others do, I hope you at least will take such measures as will convince yourself, if not others, that agricultural employments are as interesting, intellectual, and pleasing pursuits as any with which they may be put in comparison. I know of no method by which you can more effectually render them so than by employing your mind upon your work. Most assuredly the more your mind is employed upon your work—in tracing effects to their causes, in accounting for failure and disappointment, in understanding the operations of nature, in devising improvements, &c.—the more

industry is not wanting, generally succeed in making their farms the most profitable. But what I wish especially to inculcate upon you, at this time, is, that you will feel more interest, more pleasure, more conscious dignity in your pursuits, the more you occupy your mind on the subject.

Agricultural schools would aid in thus elevating agriculture.—*Albany Cultivator.*

THE VALUE OF OBSERVATION TO THE FARMER.

Perhaps to no man or class of men is the value of observation so great as to the farmer. His business is principally with natural objects. His occupation leads him in many things to imitate or follow nature. But the laws of nature are learned only by watching the silent processes and the silent operations which are going on, and thus ascertaining the causes which produce the effects which we see taking place around us. The man who watches closest—who suffers no change to take place without looking into the cause—who, in fine, observes the most, and treasures up the most in his memory, becomes most acquainted with the laws before spoken of, and by consequence is the best farmer. Although the observations which have been made and recorded by others, have become a large fund of valuable information, there is yet a vast deal more to learn. Facts are yet in the dark which can only be elicited by observation.

It would be interesting to have a history of many of the useful improvements that have been made from slight observations, which first gave the hint to set the experiment on foot. Mrs Child gives a pleasing statement of the value of observation in one instance.—A farmer not fifty miles from Boston, says she, is quite famous for the improvement he has made in the wild grape. He found a vine in the wood which dozens of his neighbors passed every week, as well as he; but he *observed* that where the oxen fed upon the vine the grapes were largest and sweetest. He took the hint. The vine was transplanted and closely pruned. This produced the same effect as browsing had done; the nourishment, that in a wild state supported a great weight of vines and tendrils, went entirely to the body of the grape. His neighbors would have known this as well as he, if they had thought about it; but they did not *observe*.

It is by thus observing that we are enabled to gather experience, and experience guides to future success. The observations that have been made in regard to the grain worm, or *weevil* as the insect is sometimes called, led many farmers to sow their wheat late. By so doing they have saved their crops. It had been observed that the insect came out at a certain time of the summer and remained active a certain number of days. Hence by sowing the wheat later so that it should not be headed out, it would escape the ravages of the insect in question. This has succeeded well with most farmers.

A farmer who will probably have 500 bushels of good wheat, told us, the other day, that had he sown

TREE PLANTING.

A correspondent in Hannibal asks for some information on the subject of planting forest trees; the most valuable kinds; the best methods of growing them, &c. &c. Mr R. will find in the former volumes of the Farmer several papers on the rearing of forest trees; but as the subject is one of great interest, and very many of our present subscribers have not seen the former volumes, we shall give some general principles in as condensed a form as possible, confident that a large proportion of our readers will find it for their interest to cultivate and plant trees to a greater or less extent.

The objects in planting trees are various, and the end to be gained should be kept steadily in view in all the operations. Trees are wanted for timber, fruit, fence, fuel, and for ornament; and the planting must be conducted with reference to these things. For timber, the oak and the elm are the most valuable; for fences, if rails are wanted, the chestnut will give the quickest and most durable growth; if wood for posts is desired, the locust or mulberry are probably as good as can be found; the several kinds of maple or walnut make good fuel; and for ornament there are none superior to the locust or maple, both of which are valuable in other respects. Evergreens have not as yet been grown in this country to any extent; but it is probable the planting of pines, larches, spruce, and fir trees, in locations suitable for their growth, would be advisable.

Observation shows that different trees demand soils of different and peculiar qualities; some flourishing best on dry and some on wet land; some on clayey and some on gravelly soils; and others on soils in which the component parts are so mixed as to give a good farming soil or loam. The oak and the chestnut will grow well on the same soil, though examination shows that the soil in which the latter comes to the greatest perfection is more sandy, or contains more siliceous matter, than that in which the oak reaches a similar state. So the pine will grow with the chestnut or oak; but to attain its greatest size, requires a soil a little different from either. It is remarkable, that some trees that flourish in the very lightest soils, will also grow in the densest swamps. Thus, the pine is not unfrequently found by the side of the cypress, while it cannot be made to grow on lands that are hard and clayey, though dry and elevated. Soils the most suitable for the oak and chestnut, are not the best for the maple or elm, the last of which, with the ash, flourish well together, the black ash excepted, which will grow nowhere except in swamps, or rather swales. It is only by ascertaining the nature of the soil we wish to plant, that we can determine the kind of tree most suitable for propagation, and this any farmer, who is an observer of the soils on which the several kinds of trees naturally and vigorously grow, can decide, without the aid of any chemical or mechanical analysis whatever. It would be absurd to plant the white oak in a morass by the side of the cypress, or the chestnut in a stiff clay, or hard-pan bottom, with the maple or elm; and the locust and mulberry require a loose gravelly soil, or the trees will be weak and the wood inferior.

The preparation of any soil for planting trees is simple and plain. It must be made deep, and loose, and rich. If the nursery ground on which the seeds are to be sown is unlike that in which the

trees are to stand, or which is proper for them, it should be brought by artificial means as near that state as possible. Thus, if too heavy, it must be trenched or drained; if not friable, deep ploughing or spading must be resorted to; if containing too much clay, gravel or sand may be added; and if not rich enough, or deficient in vegetable matter, manure or mould must be added till it is of the quality desired. If the plants are to be raised from seeds, no matter what the kind may be, the earth must be made fine previously to sowing, and the plants must be regularly hoed free from weeds. Top dressings of compost forked in between the rows will keep the land in good heart, and greatly accelerate their growth. In these respects, the treatment of fruit and forest trees does not essentially differ.

The time of planting the seeds from which the trees are to be grown, is usually the spring of the year, and always as early as the ground can be prepared for their reception. There can be no doubt, that in most cases, if the seeds could be preserved against worms, mice, &c. during the winter, it would be better to plant them in the fall of the year, as they are greatly aided in germinating by the action of the frost. The seeds of trees require but a shallow covering, merely enough to keep them from the air; as those that fall upon the earth, and are scarcely buried, if not otherwise disturbed, rarely fail of growing. The oak, walnut, chestnut, &c. are examples of this. Three years since we allowed the butternuts that fell from a tree growing in a grass plat, to lie where they fell. They were undisturbed through the winter, and when the grass was fit for mowing, the young trees occupied the whole ground. They were allowed to stand; and the next year, we transplanted from that spot to a nursery, more than five hundred trees, nearly all of which are now living and vigorous. All seeds, nuts, acorns, &c. intended for planting, should be carefully kept from heating, by being spread after gathering, and kept cool and dry until wanted for putting into the earth. Some have advised putting seeds in sand and preserving them dry and from the air in this way; and if the sand is pure and dry, it may answer, but if there is any dampness, the seeds will sprout or mould, and be rendered unfit for planting.

The maple, elm, and ash, are usually grown in this country from plants transplanted from the woods, as they can generally be found in sufficient numbers, particularly where lands have been partially cleared, and then by being enclosed, suffered to grow up again to timber. They may, all of them, however, be grown from the seed, sown in beds, and then transplanted to nurseries for cultivation, till their final transplantation. Where oak or chestnut lands are found, there is no difficulty in perpetuating these trees, as they spring up from the roots of the trees that are cut down, or from seeds already in the earth. Nothing more is required than to keep such lands fenced, until the young timber is beyond the reach of cattle or sheep. On what are called beach, and maple, and elm timbered lands, we frequently hear complaints that no young timber grows up; and the naked state of such woodlands proves the necessity of devising some way of growing young timber to take the place of that which decays by age, or is cut out for timber, fuel, or other purposes. Nothing is wanted for this but to keep the woodlands enclosed, so that no animals shall be allowed to feed in them. If the seeds that vegetate are allowed to grow, there will

be no want of young trees in any of our woodlands; if cattle or sheep can have access to them, they will certainly be browsed down and destroyed. Let those who wish to grow young timber in their woodlands, (and all who have not a large supply should do this,) pay attention to this, and they will in a few years find their grounds fully occupied.

There is some difficulty in taking trees from woodlands, and putting them in cleared lands; but if proper precautions are adopted in the removal, such as taking as many of the fine roots, and as much earth as can be made to adhere, they will generally succeed. Trees may be transplanted in the spring or fall, as best suits the convenience of the farmer. They will succeed any time after the year's growth of wood is completed, and before the next summer's growth begins. Evergreens will best bear transplanting later in the season. A variety of experiments seem to prove, that they will do better as late as June than earlier in the season. As such trees, growing in woodlands, have usually but few fine roots, the custom has been adopted in Europe, and tried with success here, of cutting around the young tree at the distance of two or three feet, a year or two before removal, in such a way as to divide all the principal surface roots, and thus cause the formation of a great quantity of fine and vigorous roots near the body. The tree is then lifted from the earth, without disturbing the earth on the roots, and is transplanted in perfect safety and certainty of growing.

As in the propagation of the stones producing fruit trees, such as the cherry, plum, and peach, the seeds germinate with more certainty after freezing, particularly in our latitudes; the stones should be planted in the fall of the year, and but slightly covered with earth, that this preliminary process may be ensured. In some instances where it was not convenient to plant in the fall, the benefits of freezing have been gained, by mixing them up with wet earth in a proper vessel, and having them frozen through the winter in that state. The danger of being destroyed by vermin may be thus avoided, and if put into properly prepared ground in the spring before germination commences, they vegetate with about equal certainty.

MILK SICKNESS.

A gentleman at the west has announced, that he has discovered the cause and the cure of this formidable disease, which has been so destructive in some parts of the western states, and has, in some few instances, destroyed or driven the inhabitants from some of the most fertile sections of the country. He is claiming considerable sums from the state legislatures for the promulgation of his specific, and should there be no humbuggery about it, he will certainly be entitled to a handsome reward, in those states where the losses from this cause have already been so great.

There are no traces of a similar disease in any other part of the world; and in the United States it has been principally confined to Tennessee, Kentucky, Ohio, Indiana, and Illinois, though it is believed some few instances have occurred in Wisconsin, and west of the Mississippi. A multitude of speculations have been made as to the probable cause of this fatal complaint, both among medical men and others; and there is scarcely a poisonous mineral or plant to which it has not in turn been attributed. Public opinion at the west seems to have settled on the opinion, that it was produced by

a low shrub or vine assuming at times the form of a climber, and bearing bunches of brown berries. Whatever the poison may be, it causes cattle to quiver, stagger, and die within a few hours. If cows eat of it, the milk is poisoned, the butter is also poisoned, and those who partake of either, are as surely injured, as if they had partaken of the original cause itself. The slightest symptoms are vomiting, and this more severe as the quantity of poison is greater, until violent spasms and death ensues. Dogs and wolves who feed on animals that have died with this disease share the same fate, and to prevent the extending of the evil to dogs and swine, cattle that die with the poison are buried carefully to avoid such results.

In districts where the disease prevails, great care is necessary in killing beef animals, as sometimes the beef will produce vomiting, when the animal is so little affected as to escape notice. To test the presence of the disease, some butchers are in the habit of driving the animal a mile to heat its blood; when if it is poisoned it will exhibit that peculiar trembling so certainly indicative of the presence of the complaint.

In remarking on the formidable nature of this complaint, a writer from the west says,—

"I have seen many farms with comfortable buildings and improvements, entirely abandoned, and their owners fled to other quarters, to avoid this dreadful cure."

But perhaps the most signal instance of its fatality is given in the following extract of a paper from Col. Hinde of Illinois, who has given much attention to the topic:

"Calling to see a friend on Darby Creek, Ohio, whom I had not seen for twenty years, he pointed to his wife and remarked—She is my third wife; I am her third husband; and in yon grave yard lie fifteen members of our families taken off by that dreadful disease, the puking complaint!"

Surely there must be some unusual fascinations in any place that would lead an individual for so many years to encounter so fatal an enemy to life. Should the announcement of the discovery alluded to, prove well founded, it will be a valuable boon to the west, and save annually great numbers of cattle and many valuable lives.—*Genesee Farmer.*

From the Farmer's Monthly Visitor.

CULTURE OF RUTA BAGA.

HON. ISAAC HILL—Dear Sir—Believing ruta bage to be of great value to the stock farmers, and as the season for sowing is at hand, I send you an extract from my farm journal, relative to my mode of culture the first year, though, as it was my first experiment, I am far from thinking it to be the best mode. However, as I was pretty accurate in detail, its publication may be of use to my brother farmers, by inducing some one better acquainted with its culture than myself, to point out the errors in my process.

ing smooth, marked it into squares of eighteen inches, and planted by dropping two or three seeds in each intersection, which was done by taking the seed from a box, with a single hole in the top. I sowed from the 1st to the 4th of June; on the 23d began to weed, thinning out where the plants were too crowded, and setting out where deficient, which I continued to do occasionally when other work did not press, till the 28th July. On the 26th October, I began to pull and cut, finishing on the 9th of November; and I found the plants last pulled as uninjured as the first, although they had been exposed to several severe frosts. They were pulled by hand, the workmen striking two plants together to shake off the dirt, and then throwing them down, where they lay spread for three hours to dry the loose dirt that still adhered to them; and the tops were then twisted off, and the plants thrown into heaps for carting, so that each root was handled three several times. They might have been got into the cart with less labor, but my object was to get them into the cellar in a tolerably clean state. Having heard much of the difficulty of keeping them in cellars, from their tendency to rot, I stored in one cellar 1,500 bushels without injury to a single root, and I have now, (May 5,) more than 100 bushels as full and as fair as when first placed there. The cellar was thirty feet square, on the bottom of which, eight inch timbers were placed, and covered with plank two inches apart. The whole was divided into two bins, with one foot space between the bins, and one foot between the bins and the cellar wall; the sides of the bins being made with narrow boards, with a space of four inches between each board.

I fed out my twelve hundred bushels to my sheep, six hundred to my horned cattle, and the remainder to my horses. They all ate with avidity, preferring them to potatoes. For my horses and cattle they were merely cut with a spade; for the sheep, they were passed through a vegetable cutter. They were carted in two carts, each containing thirty baskets holding more than a bushel, and weighing seventyfour pounds. The number of baskets was twentyone hundred, and the whole weight *seventyseven tons*. Number of roots, 36,000 —as put in the extract from my journal alluded to above. I am, sir, very respectfully, your obt. servant,

LEONARD JARVIS.

EGGS.

Almost every body loves good fresh eggs, and with or without glasses or silver spoons, can contrive to eat them; whether boiled or fried, raw or roasted, made into custard with sugar and spices, or swallowed gently with a bordering of old port, they agree with the palate and the stomach, and neatly laid out with fair slices of bacon, they form a repast within the reach of all, and to be despised by none. But though most farmers keep fowls, and raise their own eggs, there are many who have not yet learned the difference there is in the richness and flavor of eggs produced by fat and well fed hens, and those from birds that have been half starved through our winters. There will be some difference in the size, but far more in the quality. The yolk of one will be large, fine colored, and of good consistence, and the albumen or white, clear and pure; while the contents of the other will be watery and meagre, as though there was not vitality or substance enough in the parent fowl to properly carry out and complete the work that nature had sketched. In order to have good eggs, the hens should be well fed, and also provided during the months they are unable to come at the ground, with a box of earth containing an abundance of fine gravel, (if of limestone so much the better,) that they may be able to grind and prepare for digestion the food they receive. Fowls form no small item in the profits of the small farmer, and few creatures better repay the care and attention they receive. Of eggs, those of the domestic hen are decidedly the best; but those of both ducks and geese may be used for some of the purposes of domestic cookery. Eggs can be kept any length of time, if the air is perfectly excluded, and the place of deposit kept at a low temperature.—*Genesee Farmer.*

As our cotemporary teaches us how to make good eggs, we beg to reciprocate the favor, by advising him how to cook them. To be nutritious and healthful, and to suit most palates, the yolk of an egg should be cooked hard, and the white should be cooked to a jelly, the consistence of a custard. This is best accomplished neither by boiling, frying nor roasting—but by candling, that is, by turning upon it scalding water, either in a caudler or other close dish. In this way eggs may be properly cooked; and by repeating the hot water, or leaving them to lay in it a longer or shorter time, they may be easily graduated to the liking of every one, without trouble or waste.—*Cultivator.*

BOSTON, WEDNESDAY, SEPTEMBER 11, 1850.

NOTICES OF FARMS, MINUTES BY THE
WAY, &c.

VISIT TO DEDHAM.

A ride in the railroad cars gives the traveller but a glimpse of the country through which he passes; yet he may see enough to convince him, that whatever has been done by the way of agricultural improvements in times past, there is still enough to be done, to busy the next generation as well as the present in renovating old worn out fields, reclaiming unprofitable meadows and swamps, building stone-walls, setting out fruit-trees, rearing forests for timber, wood, &c.

As we leave Boston for Dedham, on the railroad, the eye is busy in viewing the receding city, the villages of Roxbury, Cambridge and Charlestown, or the beautiful cultivated hills of Brookline and Brighton, which fill the circle of splendid scenery, and the passenger is hardly aware that he is passing over a marshy, watery waste of a mile and a half or two miles, fit for neither city or country. He soon finds himself gliding through gardens and cultivated fields, and crossing over highways; every moment the scene changes, and presents some new object to view. The most prominent country-seat which appears to the traveller after gaining the open country, is that of Benjamin Bisssey, Esq. Roxbury, which is situated on elevated ground, and at a proper distance from the railroad to be viewed to advantage. The grounds about it are highly decorated with evergreens and other trees; but what strikes the eye of the agriculturist with most pleasure is the large extent of highly cultivated meadows and uplands, which are spread out before and around it. We hope at some other time to be able to give a particular account of his place, as he has done much by the way of converting his waste swampy ground, as well as his uplands, into a state highly productive; and although he has arrived at a very advanced age (past fourscore), he still carries on his improvements with the vigor of youth.

We noticed as we passed along, many tracts of unprofitable waste meadow land, which might without much difficulty be drained, and subdued and made to produce abundant crops. By the railroad we see the poorest part of the country; it gives the traveller an erroneous opinion of our improvements in farming and gardening. To form a proper estimate, the route should be by the old road over Jamaica Plains. Two miles from Dedham, we exchange steam for horse power, and pass over a portion of what is called "low plains," famous in times past for division musters. We see here an extensive plain, that has probably been cultivated nearly two centuries, which, by a constant cropping, has become rather barren, producing generally miserable crops unless an extra quantity of manure is applied; in which case a fair return is realized. By ploughing in green crops, we think this land might be much improved; but the trouble of it is, with some of our people, if they sow a field down with buck-wheat or clover for that purpose, and it looks promising, they conclude to make the most of it, and save their scanty crop, which should be given to the soil when in bloom. They probably come to the con-

clusion that they may not live another year to realize the benefit their land might derive from the operation; and so they go on from year to year, taking what they can get from their lands, without adding enough to furnish sufficient food for the plants. The consequence is, their lands are impoverished, and produce little or nothing. As well might we expect to get fat hogs upon half feed, or a full quota of work from the laborer with short allowance, as to get successive crops without manure. A young man, an acquaintance of ours, called in the spring for a few bushels of buckwheat to sow. He said he had considerable plain land, which formerly produced good corn, rye, and other crops, but that it was now pretty much run out, and gave but little feed for his cattle, which he pastured on them; he thought he would plough up a piece of it and sow buck-wheat, in the expectation of getting a fair crop. We asked him why he did not try the experiment of ploughing in a few sowings of buck-wheat, and see if he could not bring up his land a little. "O," says he, "I can't do that; I must get a crop from it this year." This is as far ahead as some of our farmers look; they will not enter upon a course of cultivation, which may take from three to seven years to bring to maturity. No; they are satisfied only with the operation which will bring an immediate return. The idea of adding to the value and strength of the soil seems not to enter into their plans.

Horticulture has received a good share of attention in the village of Dedham, and we see efforts made by many of its inhabitants to stock their gardens with good fruits. We called upon Mr E. M. Richards, a worthy member of the Horticultural Society, and to whom they are indebted for his weekly contributions. It always gives us pleasure to see a good collection of fruit, and we think highly of that individual who furnishes his family and friends, at all seasons of the year, with a succession of the most delicious; his example is manifest in the gardens of his neighbors—for a person hates to be excelled by his neighbor, even though it may be nothing more than in the excellence of his fruit, and where one man leads the way others will follow. How many luxuries of our own production we may have continually at hand, if we choose, and yet it is provoking to think, that with a climate and soil unrivalled for most of the fruits of the temperate zone, there are so many who have time and land enough and to spare, that "can't afford" (it is an ugly expression we know) to have anything more than winter apples, and perhaps these of inferior sorts, for the use of their household.

There is, however, a growing desire manifest in the public generally, for the cultivation of choice fruit, if we may judge from the increased demand for trees. Mr Richards has taken unwearied pains to obtain a choice collection. He has had to encounter a great difficulty in the natural poverty of the soil, which, like most of the soil in the village, is thin and light, upon a sandy, and, in some places, gravelly bottom, and very unfavorable for most fruits. He has many varieties of Apples, Pears, Peaches, Plums, &c. It is not the bearing year for his apple trees, and his crop will be small; his pear and peach were loaded with fruit. We noticed a number of pears on quince stocks, which we would not advise the cultivation of for standard trees; they may answer well enough for garden walls, but in the open ground they never succeed well; the tops grow too heavy for the bottoms, and are easily blown over, and though they produce

fruit earlier than those on pear stocks, are not so durable.

Mr Ebenezer Wight has taken great pains to procure a fine breed of hogs. We called to give them a look. He has some fine Berkshires, from C. N. Bement, of Albany, which are pure blood, and some crosses from E. Phinney, of Lexington, and others of his own raising, about thirty in number. He resides, himself, in the city, and visits his place only once a week, yet, under the care of a boy about 14 years of age, his hogs looked in fine condition. We are much pleased with the Berkshire breed, and think they are a great improvement over the hogs generally raised by our farmers. Mr Wight has done considerable by the way of setting out fruit trees for a few years past, most of which were in a flourishing condition. He is very particular to preserve the name of each tree, the time it was set out, and the place from which it came; for this purpose he has a book in which the location of every tree is noted, the nursery from which the tree was taken, what year set out, the name of the fruit, with remarks upon the quality of the fruit, &c.; or, if an old tree grafted, the year it was performed and the source from which the scions were obtained. We thought this an excellent plan when a large number of trees are planted.

NOTICE OF E. L. PENNIMAN'S FARM, RIVER DALE,
DEDHAM.

In noticing this farm we shall be very brief, as in the first place we made but a hasty visit, and secondly Mr Penniman has but just commenced operations. If life is spared, we shall take pleasure to record at some future period his improvements, which, from the energy he has commenced with, bid fair to be of no ordinary kind. He has lately left the city and purchased his farm containing about one hundred acres; it is pleasantly situated on Charles river, one mile from the village, somewhat secluded, on what is called "the island," and affords some of the finest river scenery imaginable. He has given it the appropriate name of "River Dale." Like a good farmer, he commenced operations, not quite a year since, by making a geological survey of his premises, and was rewarded by the discovery of two valuable mines, viz: one of fine granite, where stones of almost any description may be got out for underpinning, door-steps, &c.; very valuable in this place as there is a deficiency of good granite for building. Secondly, a valuable mine of meadow manure, of which there is an inexhaustible supply. It is strange, that although this farm has been cultivated probably from the first settlement of the town, this treasure has remained undisturbed. This, when worked over by his hogs, will produce wonders upon the farm. He has made a fine road from the public highway to his own house, a distance of about half a mile, partly through low miry ground, set out many trees, commenced in good earnest in cultivating root crops, built a commodious house and barn, &c.

But what at present is most attracting is his fine Berkshire hogs, which we were politely asked to step into the pens to see: as we had neither silk stockings nor morocco shoes upon our feet, we cheerfully accepted the invitation, and soon had his pigs by the ear. This breed are remarkably quiet and docile, and exhibit symptoms of much satisfaction in the attention bestowed upon them. We were shown a litter of full-bloods which would make

pretty pets, and much more desirable to fuddle than some of the lady's lap-dogs. They were three weeks old, and about all engaged at \$12 each. He has a fine large Berkshire boar and sow, from C. N. Bement, with full-bloods of his own raising, and some mixed. He has forty or fifty hogs on his place. He has one fine boar, crossed with the Hallam breed, for sale; a noble animal, and worthy the attention of purchasers. His principal object in raising swine, was the making of manure. He has probably learned the Flemish maxim that, "without manure there is no corn—without cattle there is no manure—and without green crops and roots cattle cannot be kept." We think, however, he will kill two birds with one stone, for while his hogs make manure, they will also yield him a handsome profit. J. B.

SUGAR BEET.

The valuable qualities of this root for feeding animals is beginning to be better understood; and we may reasonably expect that its culture will hereafter be much increased. The common beet and the mangel wurtzel, have both been proved valuable roots, but the sugar beet is much superior to either of the former, as was intimated to have been expected from the greater quantity of saccharine matter it contains. It is cultivated with as much ease and certainty as the common beet, and though usually more difficult has been found in preserving the beet or the carrot, than the ruta baga, there is really no more danger of failure where cellars of proper temperature are to be had. For making fine mutton, the sugar beet is said to be unrivalled. We find a letter on this subject in the Whip, from which we make the following extract, which we are confident is worthy the attention of all those who wish to produce from their flocks meat of the first quality. The writer was an extensive mutton grower for the Philadelphia market, and his mutton, before he commenced using the sugar beet, had obtained a high character; at last he commenced the use of this root, and as he says,—

"What surprised him most, was the rapid manner in which they took on fat, when fed on the sugar beet; and when carried to market the saddles excited particular attention, from their very superior appearance. But it was not in appearance only; the meat was of a much better quality, more juicy, and exceedingly tender. The inquiry was—Why, sir, on what do you fatten your sheep?—and when I replied, on the sugar beet, hay, and a small portion of corn, it would generally call forth exclamations of surprise. My first trial was four years since, and since that time I have been a constant grower of the beet. The meat I bring to market is always in demand, and brings several cents more per pound, than that fattened in the old way; and yet, strange to say, some of my neighbors, though I have often urged them, will not plant the beet for their stock. I have been benefited to the extent of several hundred dollars by the introduction of this root—the effects are visible—my neighbors see it, and know it—and yet they stand lookers on, halting between two opinions. But light is breaking in upon us, and of one thing you may be assured, that is, that the time is not far distant when every extensive stock feeder will also be an extensive root grower."

The opinion here last advanced is doubtless a

his own interest, be a root grower. We are convinced, that in this country, as elsewhere, the root culture lies at the basis of all profitable cattle husbandry.—*Genesee Farmer.*

From the Cultivator.

EFFICACY OF LIME IN PREVENTING INSECT DEPREDACTIONS, &c.

MR BUEL.—Sir—Although not a tiller of the soil, I have lately become a subscriber to your valuable paper, and feel a disposition to perform what little may be in my power, to increase the stock of agricultural knowledge, and to stimulate to renewed exertions those who are practically engaged in this all important, though still too much neglected source of national wealth and greatness. In the Cultivator for May, page 57, I observed a communication, which stated among other things, that a piece of corn on ground where fragments of wall, &c. had been strewn for manure, was exempt from the ravages of worms. This recalled to my recollection some facts which were communicated to me in conversation some years ago, by an intelligent old gentleman, who was for many years a farmer in Columbia, county in this state, and which were in substance as follows:—He once applied what he supposed at the time was plaster, or gypsum, but which was afterwards ascertained to be lime, to a number of hills of corn, potatoes, cucumbers, melons, &c. It was applied at the time of planting, about a handful being thrown directly over the seeds in each hill, previous to their being covered with earth. He remarked that the corn to which this application had been made, was entirely exempt from worms, while other pieces of corn in the vicinity suffered severely from their depredations. The cucumber and melon vines, &c. were also exempt from their attacks, neither were they troubled by the striped bugs or flies, with which they are generally molested. The gentleman assured me, that he had afterwards repeated this experiment a number of times, and always with a like satisfactory result. It would seem from this, that lime is to a great extent a preventive of the ravages of the grub and other insects, when applied at or previous to the time of planting. The mode practised by my informant, may not answer for all soils and situations, but the same result might probably be attained by throwing the lime mixed with the earth over the surface, and ploughing or harrowing it under previous to planting.

A short time since, at the house of a friend, while overlooking a volume of the Cultivator, (for 1835,) I noticed a communication in which hydraulic or water lime, (some account of which was given in a recent number,) is highly recommended as a paint for fences, out-buildings, &c. The writer asserts that it is more durable and much superior in all respects to common lime. With the exception of stating that he mixed it with skim milk, he gives scarcely any directions respecting the proper manner of applying it. I shall be pleased if some of your correspondents, who have used the water lime for such purposes, will communicate the result of their experience, and if favorable, state the best method of mixing and preparing it, &c.

There are in my garden, some young gooseberry bushes, which have been well manured and pruned, but the fruit, since they commenced bearing, (about three years ago,) has been uniformly rusty, as it is

ing salt dissolved in water somewhere recommended, I had it sprinkled over the bushes several times, commencing when they were in blossom, but without effect. I have also tried lime, (recommended I believe in the Cultivator.) Last fall, it was applied freely about the roots, and the branches whitewashed as thoroughly as practicable, and a small quantity mixed with water was sprinkled over the bushes two or three times this spring. This experiment answered no better than the other. It would be a source of gratification to me, and doubtless also to many other persons, to be informed of any effectual remedy for this disease, which may be known to you or any of your numerous correspondents. Respectfully yours,

New Utrecht, L. I., July 18, 1839.

REMARK.—We have cultivated the gooseberry eighteen years—during sixteen of which, we lost most or all of the crop by mildew or rust;—but the last two years the fruit has been fine, clear and healthy. We impute the recent exemption to the application of brine (salt and water) to the ground about the bushes in the month of February, which we have done two years. We consider the mildew a vegetable parasite, which abides permanently upon the collar and root of the bush, and from which seeds are disseminated, under a suitable state of atmosphere, in summer to the fruit; and that the application of salt, when vegetation is dormant, destroys the parasite without hurting the bush. Pickle may be used in the growing season, at the rate of one ounce of salt to one gallon of water. In winter it may be much stronger.—*Cond.*

Soap Suds a Specific for Nourishing Flowers.—

A fair correspondent writes to us from Newton Stewart, in the following terms:—"Recently I happened to gather a beautiful pansy, and when tired of admiring it, tossed the toy aside, which partly, by accident, fell into a box full of soap suds. The said pansy had neither joint nor root, and you may judge of my surprise when, at the end of a day or two, I found it growing. From this time forward I watched it narrowly, and now find it, after the lapse of a fortnight, a goodly plant with several buds on it. Thinking water might produce the same effect, I placed a newly cropped pansy in an element, which, pure in itself is the medium of purity in everything else; but it withered and died on so spare a diet. By way of confirming the first experiment, I have since placed a slip of a rose tree and a pink in suds, and both are flourishing in great vigor in my dressing room. Should this accidental discovery prove useful to florists, it will afford sincere pleasure to your correspondent."—*Dumfries Courier.*

It may gratify some of your agricultural readers to be made acquainted with the consumption of the city of Paris in the following articles:

During the month of May, 1839, the Paris Journal states there were consumed 6328 oxen, 1286 cows, 7614 calves, 35730 sheep, and 517,965 kilogrammes of tallow (about 2 lbs. to a kilogramme.) This was an increase over the consumption of May, 1838, of 1073 oxen, 809 calves, 1966 sheep, and 7343 kilogrammes of tallow, and a decrease of 488 cows. This considerable general increase is in part attributed to the great number of strangers attracted to the capital by the exhibition of arts and manufactures, independent of the usual influx of

THE STORMY PETEREL.

BY MARY HOWITT.

O stormy, stormy Peterel,
Come, rest thee, bird, awhile;
There is no storm believe me,
Anigh this summer isle.

Come, rest thy waving pinions:
Alight thee down by me,
And tell me somewhat of the lore
Thou learnest on the sea.

Dost hear beneath the ocean,
The gathering tempest form?
See'st thou afar the little cloud
That grows into the storm?

How is it in the billow depth?
Dost sea-weed heave and swell?
And is a sound of coming wo
Rung from each cavern'd shell?

Dost watch the stormy sunset
In tempests of the west,
And see the old moon riding slow,
With the new moon on her breast?

Dost mark the billows heaving
Before the coming gale,
And scream for joy of every sound
That turns the seaman pale?

Are gusty tempests nirth to thee?
Lovest thou the lightning's flash?
The booming of the mountain wave—
The thunder's deafening crash?

O stormy, stormy Peterel!
Thou art a bird of wo!
Yet, would I thou could'st tell me half
Of the misery thou dost know.

There was a ship went down last night,
A good ship and a fair;
A costly freight within her lay,
And many a soul was there!

The night-black storm was o'er her;
And 'neath the cavern'd wave,
In all her strength she perished,
Nor skill of man could save.

The cry of her great agony
Went upward to the sky;
She perished in her strength and pride,
Nor human aid was nigh.

But thou, O stormy Peterel,
Went'st screaming o'er the foam;
Are there no tidings from that ship,
Which thou canst carry home?

Yes! He who raised the tempest up,
Sustained each dropping one:
And God was present in the storm,
Though human aid was none!

BONE MANURE.

The subscriber informs his friends and the public, that, after ten years experience, he is fully convinced that ground tones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells.
Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will receive prompt attention.
March 27. NAHUM WARD.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable to the complicated machines in general use to get out of order.

GRAIN CRADLES.

The Grain Cradle is an article which is coming into very general use in the New England States, where they were till of late but little known, although they have been in very general use in the southern and western States, for many years, and which is found to be decidedly the best mode of harvesting grain, as it is supposed one man will cradle five acres in a day when he cannot reap more than one. For sale by JOSEPH BRECK & CO., 51 & 52 North Market Street.
July 10.

AGRICULTURAL AGENCY.

The subscriber having been removed from the Post Office, by the pleasure of the President, and left for the present without any means of supply, has consented to resign the editorship of the "American Farmer," which he originally established, and the first periodical in America dedicated to the cause of Agriculture—That resource, though "better than nothing," being altogether inadequate, as an additional means of livelihood, he has formed with his son, Theodore Gland Skinner, a partnership to conduct an AGRICULTURAL AGENCY for the sale of real estate, and for the sale and purchase of domestic animals, horses, cattle, sheep and hogs, especially of improved breed, Agricultural machinery and implements, seed grain, garden and field seed, and for sale of patent rights, *Morus Multicaulis* Trees, &c. He will only add, that they will strictly guard the interests of their employers, and that through them no humbuggerly shall be practised knowingly. Address, postage paid, to Baltimore, August, 1839. J. S. SKINNER.

AT QUINCY HALL, BOSTON, SEPTEMBER 23, 1839.

The public are reminded that the Second Exhibition of the Massachusetts Charitable Mechanic Association, for the encouragement of Manufactures and the Mechanic Arts, will be opened in Quincy Hall, on Monday, September 23, 1839.

Mechanics, Artisans, and Manufacturers, who intend to offer articles for Premium or Exhibition, are particularly requested to give notice to the Secretary or Superintendent, at as early a day as convenient, specifying the articles intended to be offered.

Contributors are also reminded that all articles intended for Exhibition must be delivered to the Superintendent, WILLIAM WASHBURN, at Quincy Hall, on or previous to WEDNESDAY, September 18, accompanied by an invoice, and a particular description of all new and important inventions, or improvements in the articles offered.

Steam Power will be furnished to put in operation all Machinery, and the Superintendent will take particular charge of all Models offered for this purpose.

Competent Judges will be selected to view all articles presented. Premiums will be awarded to those deemed most worthy of that distinction.

Articles will be offered by Apprentices, who will have a division specially appropriated for their productions.

Tickets of admission will be furnished to all contributors. J. G. ROGERS, Secretary.
WM. WASHBURN, Superintendent.

August 23.

Complete Garden and Horticultural Tool Chests,

From Sheffield, England; containing Garden Shears, improved Pruning Shears and Scissors, Pruning and Grafting Knives, Flower Grafters, Garden, Dutch and Triangular Hoes, Saw, Spade, Wooding Hook, Garden Rake, Trowel Hammer and Garden Reel, comprising every useful implement necessary for the cultivation of the Flower Garden. For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street.

WINTER RYE.

Just received at the New England Agricultural Warehouse and Seed Store, a supply of prime Winter Rye for sowing. JOSEPH BRECK & CO.
August 14.

STRAWBERRIES.

Those who are desirous of cultivating this delicious fruit are respectfully informed that the subscriber has succeeded, after a number of years experimenting upon the Strawberry, not only in obtaining new varieties, but in ascertaining the best method of cultivation.

Specimens of the fruits grown in his Garden, have been exhibited at the Massachusetts Horticultural Society Rooms the four past years, and are also too well known in Faneuil Hall Market to need a particular notice here.

He has for sale at his Garden in Brighton, Mass., the following eight varieties of Plants. They are of superior stock and quality; all warranted to be truly named, and free from the mixtures often found in those offered for sale promiscuously.

Those who are in want of Strawberry Plants, are respectfully invited, and they will find it interesting, to call at the Garden, and see the manner of cultivation. The method of cultivation, and any information desired will be cheerfully given.

The subscriber would state that from many years personal experience, he is satisfied that plantations of these vines made the last of July or early in August, by careful and constant attention will produce nearly or quite as much fruit the season following as those plantations made in the Spring will produce the second year.

Barren's Seedling Maren.—A new and valuable kind. A free bearer, fruit large and juicy; fruit measuring four and a half inches have been exhibited the present season.

Milven Castle.—Fruit extremely large, high flavored, and showy. Specimens of this kind have been exhibited at the Horticultural Rooms for two years past, measuring five and a half inches in circumference.

Ball Scarlet.—Fruit large, full bearer, and beautiful scarlet.

Early Virginia.—This is considered the earliest fruit—a free bearer, hardy, and very early; decidedly a fine kind for market.

Royal Scarlet.—Fruit long oval shaped and juicy. *Hambrois.*—Fruit smaller but very numerous.

English Wood.—Fruit well known.
Monthly—Fruit is gathered from the vines from June to October, and in good quantity and fine quality.

Orders left at the Garden, or directed to the subscriber, Brighton, Mass., or left at Messrs J. Breck & Co's Agricultural Warehouse, Boston, will be carefully and promptly attended to, and all Plants will be carefully packed and forwarded agreeably to directions.

JAMES L. F. WARREN.

NOTICES OF FARMS, MINUTES BY THE WAY, &c.

Mulberry Trees—Silk Business—Call at General A. Holman's Farm, Bolton, Mass.

Passing through Bolton, we availed ourselves of the opportunity to call upon Gen. A. Holman, who has had considerable experience in raising and setting out mulberry trees, feeding worms, &c. He commenced his operations six or seven years since, and began to set out his trees for the purpose of producing silk. His farm is admirably adapted for this business, there being but few places in our estimation, which are more favorable. It is situated on the eastern side of an elevated and extensive well of land, commonly known by the name of Bolton hill, from whose summit a great extent of fruitful country is visible: the soil is generally a strong loam and rather rocky. He has from 5 to 2000 trees, which have been planted at different times from 5 to 7 years: many of them stand from 10 to 15 feet distant from each other, and have low heads: the land is laid down to grass. It is now our years since he began to feed worms. Two years ago, about 50 lbs. of manufactured sewing silk was produced: last year 55 lbs. of reeled silk, which was sold for \$6 per lb., which with the bounty from the State of \$1 50 per lb., would amount to the sum of \$412 50. The quantity of silk this year cannot be ascertained, as all the eggs which are produced from his cocoons have been connected for by a house in Philadelphia. The quantity of cocoons is supposed to be not quite so large it was last year. He will probably have from 25 millions of eggs, which will be worth six times as much as what the silk would bring. His worms are a superior variety, called the "brown smooth," which he thinks the best of all varieties for our climate: they have given universal satisfaction wherever they have been used. Two crops of worms have been produced this season: the first were hatched out the last of May: the second the 4th of July. Two crops he thinks it is that can be profitably raised in our climate. There is no difficulty in keeping the eggs from hatching before they are wanted. They are put in a demijohn and corked up, but not perfectly tight, as that would destroy the vitality of the eggs; they are then placed in a cool part of the cellar on the bottom: in this way they may be retarded until late in the summer. He is satisfied now that he has injured his trees by stripping the leaves too close before they had attained sufficient strength and vigor to bear it, and that they have been much retarded and retarded by it. This is the reason why the quantity of silk has not increased with the age of the trees. The trees are of the common white variety, and do not give satisfaction on account of the smallness of the leaf, as it requires much time to gather them in comparison with some other vari-

He thinks highly of the *morus multicaulis* for the southern climate, and has many growing for sale. They will not probably be profitable in this region, if we may judge from the ill success which has attended their cultivation this year. We hear of some growers who will not raise so many trees as they planted in the spring, and others who are much disappointed in the number calculated upon; they either planted them too deep, or cut them up too much, or it was too cold or too wet, or they were injured in the cellar, or some plaguy thing or other befell them. We have seen many fields from which but little foliage could be spared, even as late as the first of August: they will do for the southern climate, but not for ours.

Gen. Holman has converted the upper part of one of his barns into a convenient cocoonery, 50 feet by 25, well ventilated on every side, and filled with shelves in six tiers, capable of accommodating 500,000 worms. An elderly and infirm man and his wife have performed most of the labor in tending the worms and gathering the leaves: some extra help was given during the last stages, when an increased quantity of leaves are necessary. They were busy in stripping the cocoons from the bunches of straw on which they had spun. We have frequently seen branches of trees with the leaves on, put up for the worms to spin upon, but the straw appeared to us much better, as the cocoons are more easily taken off: a handful of straw is tied at one end, and cut off the other end the length of the distance between the shelves, and set up between them on the tied end, forming an inverted cone; the worms crawl up and fill the straw.

Gen. Holman spoke with confidence concerning the silk business, and feels encouraged by the success which has attended his first efforts, to pursue it, and thinks it will ultimately prove profitable. It would be wrong in calculating the profits of the business, to take as a guide the produce of the three past years: if the rent of the land, interest of the money expended for trees, labor, &c., were all reckoned, it would probably appear that the proceeds of the business have fallen considerable short of the interest of the outlay and labor. It should be remembered that a mulberry orchard does not begin to pay until from 7 to 10 years of age, although we have had statements to the contrary, which have greatly misled those who were disposed to embark in the business. When we had our first silk fever, five or six years since, multitudes were urged on by false and exaggerated accounts, expecting to realize enormous profits in four or five years; but they soon found out that it was easier to make calculations on paper than to carry them into practice. The severe winters which destroyed the young trees, and a little experimenting, disheartened individuals as well as companies, and they saw the prospect of a golden harvest vanish like dew before the morning sun.

S. V. S. Wilder, Esq., of New York, who owns a large tract of valuable land on the north and west

business, and has always been strong in the belief that it would be one of great profit. He was for many years a resident of France and engaged in the silk trade, and well acquainted with the manner of rearing worms and the production of silk in that country. To encourage others in the business—he set out with much care four years since, 4 or 5000 trees on a part of his farm near the bottom of the hill. The soil is of an inferior quality—a poor sandy loam on a gravelly bottom. The trees were set, we believe, twelve feet apart; the holes dug three feet square, and great pains taken to insure their growth: the trees were three or four years old when taken from the nursery. This orchard has proved a failure: most of the trees are either dead or badly stunted. One cause of the failure is the poverty of the soil, and another, the severity of the winters.

We have seen in our perambulations great quantities of young trees which the owners call Alpine, that are nothing more than the Brousa mulberry. The Brousa will, we think, prove a valuable variety for our climate.

Bolton contains many well cultivated farms: we noticed one owned by Mr. Moses Greenleaf, where scarcely a weed could be found; all his crops were perfectly clean—quite a contrast to most of the farms which have come under our observation. It is often the case with a field of potatoes, that they are choked and over-topped with pig-weeds, roman wormwood, and other vile weeds, very much to the injury of the crop, and against the character of the owner. This farm is an exception to the great majority—we therefore take this opportunity to commend the proprietor for his industry in thus employing his boys and himself at odd hours in cleaning his grounds, thereby benefiting his hogs, crops and farm, and setting a good example to his neighbors. We saw on this place the finest piece of onions that we ever laid our eyes upon: there must be nearly 150 bushels on about a quarter of an acre. When his crop is gathered we hope to give an exact account of the number of bushels and rods of land, together with his mode of cultivation, &c., to the public through the N. E. Farmer. We observed here some very early Canada corn, which was then ripe or nearly so (Aug. 29th). It was planted thick, and believed by the owner that as much was obtained as from a larger variety, [we doubt it,] and there was no fear of losing his crop from an early frost. He has some excellent varieties of early apples, which we have not before seen, that would command a high price in our market. We find in almost every town, some fine variety of native apple, peculiar to the place, which would be highly prized if known by our horticulturalists and market men. If half the money which has been spent in importing foreign apples, could be spent in collecting some of our own fine native sorts that are scattered over the country, we should have a larger accession to our list of fine apples than has been ever made before.

nificent view of a large extent of mountainous country, which bounds his vision: some of the most prominent peaks are the Wachusett, Monadnock, and the Peterboro' mountains. The valley of the Nashua is spread out like a map under his feet, its extensive intervals, ornamented with noble elms and other trees, single or in groups or groves, which, enlivened by the villages of Lancaster and the numerous farm houses in the distance upon the swelling hills beyond, forms one of the finest scenes for the landscape painter imaginable. The intervals of the Nashua are fertile and produce grass and grain in abundance when well managed. Some of the intervals have a fine growth of the shag-bark walnut, which yield fine crops of nuts. We know of one farm from which have been gathered nearly 100 bushels in a season. There is considerable land in Lancaster that is wet and cold, which might be greatly improved by drainage: it is generally so situated that it could be easily effected. We were on one farm where considerable improvement had been made in this way, and was assured that the produce was fourfold. One gentleman said he was much pleased with the Indian wheat—had good success in raising it, and thought it equally as good for his horse as corn, and that when properly ground, makes fine flour for warm cakes. We have a promise of a communication from him on the subject.

It was in this town we spent five or six years in the cultivation of "Lancaster garden," which is situated near the junction of the two branches of Nashua river, having a fine alluvial soil and well adapted to the growing of garden seeds: it is now owned by J. D. Huntington, Esq. and occupied for the same purpose. When under our care, we had an extensive collection of hardy and half hardy herbaceous plants, embracing the most of our fine native American species, as well as all the exotics which could be obtained. As the present proprietor is not a botanist, nor much acquainted with the cultivation of plants, many of the varieties have been lost, but there still remain many fine ones, which are offered for sale, and may be bought low. The garden was commenced by Mr J. B. Russell, the former proprietor of the N. E. Farmer and Seed Store, and has furnished to the amount of twelve to fifteen hundred dollars worth of seeds annually for this establishment. J. B.

[For the New England Farmer.]

THE AGRICULTURAL PROFESSION.

MR EDITOR: My mind has long been made up to the belief, that of all callings and professions, agriculture is the most healthful, the most pleasant, the most honest, and what will weigh most with the great mass of the community, the most profitable; yielding the largest returns in health, happiness, virtue, and—*money*. I wish particularly to impress this truth on the community, at present engaged in a devil-may-take-the-hindmost race for wealth, sudden, rapid, inordinate wealth—money told by millions and measured by cartloads—obtained by speculation, (*gambling* were the more appropriate term,) and lost probably by the revolving of the same erratic wheel of chance. Regardless of the silent lesson we may take from the Creator's works, in the fact that in the natural world ephemera are insignificant by the side of those things of which are remarkable for durability, the gourd in the shade of the cedar of Lebanon, the poplar beside the oak,

the linnet beside the bald eagle, we go on attempting to accomplish in a year or the half of it, that which were better done in twenty, and more pleasant to the conscience and more beneficial in its results, when made the labor of the best part of a life. I have no good opinion of sudden fortunes. Seldom do they abide with those who made them. Obtained by all sorts of risks, (often not very honorable ones,) they may be classed in the category with lottery fortunes and the thrift of the privateersman—both proverbial for the suddenness and sureness with they are translated to other pockets.—Now the best method of being installed into that eagerly coveted predicament, *rich*, is the buying of a farm to be trebled in value by skill and industry—by the silent though slow—observed yet unfelt progress of growth, improvement, and amelioration—the colt becoming a horse—the calf an ox—the oak coppice a lumber lot—the sloughy moor a productive meadow.

An industrious and prudent farmer whose family are in good health, and are brought up to active habits, necessarily grows rich. Whilst he sleeps the work of enriching goes on—his being the only stock of trade which necessarily improves in value. And then *expense*, the leech which continually sucks at the main artery of men of substance of every other profession, has little to do with an industrious and prudent farmer. The wants of such a man are few beyond what his own hands can supply, nor yet acquire for him the reputation of being a niggardly housekeeper. The means are almost entirely within himself of living gentlemanly and well—may more, *luxuriously*; and without Corporal Trim's "here-to-day and gone-to-morrow"—the extravagance to-day, and destitution to-morrow, which very frequently (and for the two last years but too commonly) accompany a business less certain than that of husbandry. Our country has been lately, and no doubt will be again, prosperous exceedingly, and of wealth redolent; but throughout those years of prosperity, the fabric of national greatness lacked the solid foundation—the granite basement. The agriculture of the country evinced but little of the spirit which animated and directed the other branches of industry. Towns sprung up in the wilds, but agriculture had nothing to do with them—they were begotten of Utopian scheming: fleets bespread the ocean, but disowned any acquaintance with the great primeval art which is the source of all wealth. Men cared only for rapid fortunes, and so dealt more in the bargain and sale of lands than in their usufruct.

It cannot be disputed that never can we become truly great, or truly rich, or truly powerful, or truly independent, till agriculture shall be a more honored and coveted employment amongst us. Shame on us if we continue to neglect it. What! shall we, proprietors of most sunny and benignant skies, and of soils rich and various—in our own estimation the wisest and greatest of nations, and by all accounted very shrewd, enterprising and clever—pride ourselves upon our independence, whilst we are occasionally indebted for the very necessities of life to those who may abridge us of them at a week's warning. And this vile subservience exists whilst we have the means of making our physical independence as complete as our personal and political. No, my dear sir, we *must* lay the foundation for a production commensurate with the wants of quadruple our present population. We must emulate the Dutch and Flemings,—at least adopt our models from our father land.

Apart from its promising less rapid fortunes, there is another cause for the low state of farming amongst us, and that is, *it is not the fashion*. It has been, possibly is now, supposed by many, that other callings are more respectable—other professions of a higher *caste*. Mistaken men! false opinions! blind public! If we look at those countries where a genuine aristocracy prevails—England, Germany and Hungary, we shall find that landed possessions, especially patrimonial acres, are the most coveted species of wealth—that they have an imaginary over and above a *real* value, as conferring honor upon their possessors which other species of property do not have—the fee simple of land being the most honorable kind of wealth. From my own personal observation daily made for near three years I can say that in Europe every thing has been done to elevate agriculture, and that public opinion by assigning to the pursuit the greatest and yet no over-estimated importance, has created that national taste which has produced the well known results "Citizens," says the author of "Rural Economy" "who breathe the air of London five days in the week, are farmers the other two. Numbers even desert the occupations to which they have been bred and apply themselves to a trade so much more pleasing and independent. All sorts of people not absolutely fixed in other employments, *partake of the fashion*, and turn farmers—physicians, lawyer clergy men, soldiers, sailors, merchants."

The consequence of the great honor paid to agriculture may be guessed. England, from the Land's End to the Scottish border, and half of the Scotch counties, is one continued garden. Not only fertile, and made surpassingly more so by the use of manures, it exhibits such surpassing beauty of cultivation that it is worth a voyage across the Atlantic but to see and admire them.

Farming has with me ever been a passion. I commenced it at a very early age. I can recollect going amongst the reapers at six years old, equipped with a *jack-knife*, and giving them my Hercules aid, with the cheering exclamation, "we shall soon be done now." I had a set of miniature tools made for me, and they were put into my hands to be used too. I had a share of every thing raised on the farm or growing upon it—small indeed, but in the estimation of the boy, larger than the rents Crassus received from his provinces, or Prince Paul Esthazy from his patrimonial domains. The long ridge-row of corn, and so of every growing crop, lambs made peculiar by some spot or mark—I my toll was gathered from every thing. From being so soon a proprietor, I grew up with the keenest love for the pursuit—happiest when occupied with rural tasks—happier when I saw buds unfurl and germs expand—lambs frisking down the slope of the ravine, and other concomitants of rural life than the driveller in the king's gate or those who in the language of scripture, are clothed with purple and fine linen. And then, whilst I was engaged in rural life, I had many pleasures which were the purest kind. I can remember with what pleasure my occasional absences were fraught, returned to the most numerous and the most affectionate body of friends that ever welcomed a wanderer. My flocks and herds remembered the liberal hand, and came round with *low* and *bleat* to receive their accustomed caresses and bounties. I was joy in my out-door household: actually I shed tears as I received the greetings of the friends whose tones were to be translated into language of unstudied and untaught affection.

Agriculture is an employment which not only touches the heart but gives pleasure to the eye, which is sure to receive its due portion of delight. Every thing on a well conducted farm at every season is beautiful—at some seasons indescribably so: gratifying to a proud spirit and soothing to a wounded one. It is the farmer's own creation; it has been called into life and activity and breathing energy by his own genius and industry, and when he has thanked God for the sun, and the shower, and the strength lent him for labor, he may be a proud man, nor be ashamed of his pride, and a vain man, with his vanity proceeding from a good source—his own merit and perseverance.

Most happy should I be if what I have here written should be the means of transforming one city or village into an industrious country farmer. As he is reckoned a public benefactor who makes two sheaves of grass grow where but one grew before, so may he be estimated who converts a "weed rotting on the earth's brink" into a useful vegetable.

Mr Colman: My pen such as the above hastily penned paragraphs show it to be, is very much at your service.

I. A. J.

Southboro', Aug. 28, 1839.

To the Editor of the N. E. Farmer:

SIR—As my experience is small in the cultivation of the peach, and as I am unable to give Mr Blake any information on the subject, or "account for this freak of nature," I transmit his letter to you, with the addition of a few lines.

In the orchard of Peter Fay, of this town, there is a case of as prominent a deviation as those in Mr Blake's garden. A peach tree on his ground having two branches three feet from the ground, has always before, for some years, presented fruit ripe about the 20th or 25th of September—a free stone. This year the fruit on the southwest branch of this tree began to ripen by the 15th of the present month (August), and are now all taken from this branch, while those on the other part of the tree are not changed from their former character. I send you the two kinds, (as they appear to be) from this tree for your inspection.

Respectfully Yours,

JOEL BURNETT.

N. B.—Mr Blake has paid great attention to cultivating the peach, and his garden has many varieties.

J. B.

Westboro', 24th Aug., 1839.

DR. BURNETT—Knowing your taste, experience, and success in horticultural pursuits, I am induced to address you, stating some facts and offering queries in relation to fruit growing.

Some years since I obtained a lot of peach trees from a nursery in Hartford, Ct., one of which had shown fruit two years, which were White Rarieripes, in accordance with its label—ripe 28th of September. This year it presents an early Clingstone, beautifully colored with red and yellow, and beginning now to be ripe—23d of August.

I have also a seedling which was never transplanted, with two distinct branches, making a fork about 18 inches above the surface: both branches produced peaches of a moderate size and quality; a few of them had a little blush—ripe 24th of September. One of the branches is now, (23d of August) ripening its fruit, with increased size, rareripe

Can you account for this freak of nature, and by communication oblige

Yours,

ELIHU BLAKE.

REMARKS.—It is not in our power to throw any light upon these "freaks of nature" which our correspondent and his friend Mr Blake, have made known. It does not, however, seem possible to us, that a tree of any description should produce two sorts of fruit so different as those sent by Dr. Burnett, unless it was effected by budding or grafting. Is this not the case? The two varieties of peaches sent for our inspection, are as different as can be: the large ones were delicious and handsome, while the others were small, green, and far from being ripe.

We had written thus far when our friend, J. L. L. F. Warren, of Brighton, called upon us, and he being an experienced horticulturist, we laid the case before him, and to our surprise was informed, that he had a peach tree which bore three distinct varieties of fruit, which were exhibited at our horticultural society's hall a few years since, and reported in the N. E. Farmer. They were on three distinct branches: one variety a clingstone, rose and blush, one a rareripe, and one a rose cheek free-stone—all first rate fruits. He supposes that they proceeded from a stone with three kernels, as the stem of the tree had the appearance of three trees closely united and grown together. We know of no other way to account for this apparent singular deviation from the common course of nature. We know that a dozen seeds from a dahlia will frequently produce as many varieties, or the seeds from a capsule of carnation sport in the same manner, and on the same principle two or three kernels in a peach stone may produce different sorts; but that a tree should bear more than one kind of fruit, unless grown together at the bottom, or by the process of budding or grafting, our faith is hardly large enough to believe without a very close investigation.

J. B.

P. S.—One of our eminent nursery men informs us that he once saw an apple tree, a branch of which produced two distinct varieties of apples; that he examined it closely and could not perceive any appearance of its having been budded or grafted: this of course is a stumbling to our faith, but still we cannot give up the idea that without artificial means the thing is impossible.

For the New England Farmer.

STRAWBERRIES.

MR EDITOR—A neighbor of mine having very successfully cultivated the strawberry this season, I send you a sketch of the results, hoping it may induce some of your readers to "go and do likewise."

The ground measured ten rods, has a southern aspect, and is of ordinary quality. This plot was planted with the Methven Castle four years since, has been well taken care of, and is now well covered with vines. From June 18th to July 19th, were sold strawberries to the amount of \$77. The quantity gathered during this period weighed 258 lbs. and measured eight bushels and three pecks. The amount of expense for labor, manure and sending to market was \$6.44. These strawberries were sold to the Astor House, N. Y. and none were sent measuring less than two inches and a half in cir-

This I think, Mr Editor, is profitable horticulture. It is at the rate of more than \$1120 per acre. This cultivator reaped more from his little patch of ground than many of our farmers do from acres; and so it will be till they can learn to cultivate less land, and that, from their bad management, generally half starved. A farm should be an extended garden; and then every inch of ground, grateful for the care we have taken of it, will bountifully repay our labour. Mother earth is better than her children; she is grateful for favors and returns them.

These strawberries were sent from Dedham to New York for a market. What a blessing these Rail Roads are, especially to farmers! ensuring a more ready sale for produce by multiplying markets, and bringing distant ones near. If farmers are faithful to their true interests they will be excited by these increased facilities to make greater improvements in agriculture, with the assurance that they will increase an hundred fold the produce of their fields, and receive a liberal reward for the labour of their hands.

W.

Dedham, August 22d, 1839.

WATER CAUSING FIRE.

Ashes made of hard wood, when first made, and so long as they are kept dry, contain a metal called potassium: discovered by Davy, and which is the basis of potash. This metal the moment water touches it, decomposes the fluid by the absorption of its oxygen, and the combination produces a brilliant combustion; the result of which is potash, or in other words potash is an oxide of iron. Quick lime and water produce heat sufficient to set fire to wood, but there is no actual combustion of the substances themselves.

In the case of the potassium the flame is brilliant, the instant it is touched by the water. It is supposed that this fact will account for many of those fires which have originated from ashes taken up and kept safe, until all fire, it was supposed, was extinguished, and which was probably the case, and which was then turned into some small box or barrel, until they could be disposed of. Such perfectly dry ashes, free from fire, would, should they come in contact with a wet stove, board, or even exposed to a current of moist air, would produce sufficient combustion to ignite wood, or coal, and might thus be the means of causing an extensive conflagration. That water produces flame, is here evident, but this is only one of the many wonders that the science of chemistry has in modern times revealed.—*Genesee Farmer.*

Influence of Climate upon Seed. We received, last spring, twelve ears of Dutton corn from Mr Osborn, from Oswego county, his residence differing from ours in latitude and altitude, about two degrees. We planted with this seed about eight rows across our field, the residue being planted with seed of our own raising. The Oswego corn tasselled about two weeks earlier than that from seed raised in Albany, thus showing six or seven days' difference for a computed degree of latitude in the earliness of the crop—the northern seed giving the earliest crop in a ratio inverse to the forwardness of the spring. This will serve as a hint to farmers in districts where corn is liable to be cut off by early autumnal frosts, to obtain their seed from a more northern latitude, or from a district of higher latitude.—*Albany Cultivator.*

A BIRD STORY.

Milton, Ulster co. N. Y. July, 1839.

FRIEND BEE—I would not have ventured to forward the following statement, were it not that the narrator of it, Edward Hallock, of the firm of Wm. Hallock & Brother, of Milton, Ulster co. is known to thee, and known to be of unquestionable veracity. I have heard him before express his conviction, that if birds were protected and cherished by farmers and others, we should never be subjected to the loss of corn or other crops by grubs; and that other noxious insects would be sensibly diminished. There is a small kind of bird (the males nearly black, the females brown,) that is noted for being around and following cattle in the field, as in the case I am about to detail. Mr H. says, "on the 20th of the present month, I was ploughing for turnips, myself with one team, and my son with another; and observing that we were followed by a flock of the above little birds, I took it into my head to notice their motions, to ascertain what was the attraction, when I perceived that their object was grubs. We ploughed up plenty of a small white and a large brown or grey grub, as well as some in a chrysalis state, and angle worms; all of them *excepting angle worms*, appeared to be acceptable to them; and as the sequel will show, they were capable of devouring large quantities. I should think that one would make way with at least 100 per day. I cautioned my son against making any motion towards noticing them, in any way to intimidate them; as I found they grew more and more bold in their honest avocation, and as the land diminished in width, they would remain in the opposite furrow when not more than three or four feet distant. At length my son spoke cautiously, and said there was one on his plough beam. I then stopped the teams and told the boy to pick up a grub and show it to the bird that had distinguished itself by its tameness. He did so: and the bird immediately seized it. Encouraged by this, I told him to pick up the next white one, and hold it out in his fingers near the ground, crawling down, he did so, and the bird came and picked it out of his fingers! Afterwards he stood up and held out one, and the bird lighted on his hand and picked out the worm. This was repeated until it lighted on my own hand; I raised it up and applied my cheek to its wing without frightening it away. The next day he was not slow in finding us, and practised the same familiarity, in presence of James Sherman, William Hallock, and others of the neighbors: it came into the corn field where the boys were weeding corn, and actually, without any special attraction, perched upon the head of one of the boys; it continued these visits until one of the boys in an adjoining field, could not repress his inclination to seize and hold it. This made him more wary, but he gradually recovered his confidence." I communicate these facts in the hope that they may contribute to produce an examination into the subject, of how far it would tend to the agricultural interests, to fall upon some method to tame and familiarize small birds, instead of frightening, maiming or destroying them.

E. HULL.

Horses Slobbering.—Various opinions exist as to the cause of the excessive salivation that horses sometimes undergo, and which must detract seriously from their strength and ability to labor, as well as from their comfort. Some have supposed it to

result from the second growth of grass that makes its appearance in July or August, the *Euphorbia maculata* of the botanist; some to the second growth of red clover, some to white clover, some to the web of the spider that is spread so extensively over the later feed of summer, and some to the action of the Lobelia. We have had little doubt that it was to be attributed to this last cause, always feeling safe when our horses were in pastures where no lobelia existed, and when afflicted by it, finding them to be speedily cured by removing them from the fields in which it is to be found. In an Augustus, Maine, paper we find the following, which would seem to go far to confirm the belief that salivation, is sometimes at least, caused by this pest of our meadows and pastures.

"Our own family jade—a hearty kind old creature—has not enjoyed the luxury of grass for three years, and has always been kept in good trim on hay, with very little provender. In July we had the barn filled with her year's stock of hay, sweet from the field. Soon after the horse began to eat it, she commenced slobbering abundantly. Being quite out of patience, we set our wits to work to ascertain the cause. Some told us it was white clover, some said it must be lobelia. On making strict examination, we found that the last load put into the barn, had much lobelia, and but little white clover in it. As an experiment, we, for several days in succession, previous to feeding, were careful to cull the hay by handfuls, and pick out the lobelia. From this moment the slobbering ceased. On giving the hay again without picking it over, the salivation began again. So that we are satisfied that lobelia is the cause of slobbering in horses. Can any one tell us what will cure this slobbering, without the pains of separating the lobelia from the hay?"

A Word for the Dumb Creation.—If you keep dogs, let them have free access to water, and if practicable take them out into the fields occasionally, and let them have an opportunity of swimming whenever you have the chance. If you keep birds, do not, as is too commonly practised, expose them in their cages to a hot sun; it is a cruel and fatal mistake. If you do expose them out of doors, cover the tops of their cages with a piece of carpet, or which is better, a green sod or abundance of leaves. Those who have the care of horses should be especially attentive during sultry weather, to give them water or moisten their mouths.—We have often been shocked to see some of the laboring horses, in sultry and dusty weather, foaming at the mouth and ready to drop under the intolerable torments of thirst.—*American Farmer.*

To Cure wounds on Horses and Cattle.—Mr. Tucker—I became a subscriber at the commencement of the 3d volume of the weekly Farmer, and in the first No. of that volume, I found a recipe to cure wounds on horses and cattle, which alone has been worth more to me than ten years subscription, and I think it would confer a favor on thy patrons to republish it in the present volume.

SILAS GAYLORD.

Skaneateles, 7th mo. 26, 1839.

The following is the recipe alluded to, in the above note of Mr Gaylord:

Mr Tucker—As there are many useful receipts hidden from the public, for the sake of speculation in a small way, by many who would be thought

something of in the world, I am induced to lay before the public a recipe for making KING OF OIL, so called, which perhaps excels any other for cure of wounds on horses or cattle, and which has long been kept by a few only in the dark. Feeling a desire to contribute to the good of the public, but more especially to the farmers of Genesee, I send you the following very valuable recipe for publication:

1 oz. of Green Copperas, 2 do White Vitriol, 2 do Common Salt, 2 do Linseed Oil, 8 do West India Molasses.

Boil over a slow fire fifteen minutes in a pint of urine; when almost cold add one ounce of oil of vitriol and four ounces spirits of turpentine.

Apply it to the wound with a quill or feather, which will immediately set the sore to running, and perform a perfect cure. Yours respectfully,

STEPHEN PALMER.

Middlebury, Dec. 10, 1832.

BEEF SUGAR. We learn from the American Silk Grower, that the conductors of that periodical, having made themselves familiar with the process of manufacturing Sugar from the Beet, they confidently expect to produce as good and cheap sugar as that made in France. They have five acres of beet now under cultivation, and the necessary machinery for their manufacture into sugar, in the course of preparation. Success to them. We are glad to see this important business fully tried within so short a distance of us, by gentlemen who are as likely to succeed as any others in the country.

There is now growing in this district of country, a considerable quantity of the sugar beet—many of our farmers being determined to test their value at least as food for cattle. We have not, however, heard of any preparation for the manufacture of sugar; but we trust the subject will be duly taken into consideration, and at least a theoretical knowledge of the business acquired. All it wants is a start—and having received this, the sugar manufacture will soon become sufficiently extensive to make us independent of other countries for this necessary article of domestic comfort.—*German-town Telegraph.*

The best stump machine I have seen or heard of consists in a *wheel and axle*. A large but simple frame is supported by two upright posts within the frame, and upon the uprights an axle is made to revolve by a wooden wheel of some ten or twelve feet circumference, with a strong chain passing around its periphery. Two yoke of oxen will turn the wheel, and thus another chain fastened to the axle and to the stump under the machine, is wound around the axle until the stump is torn from the earth. The machine though light is somewhat unwieldy; but the difficulty of transporting it from one stump to another might be removed by affixing wheels to it, and this would in no wise interfere with the operation of the machine. It is difficult to say how many stumps might be pulled up in a day in this manner, for such computation would be influenced by a variety of circumstances, such as the character and size of the stumps, nature of the soil, &c.; but many hundred acres of the New England territory have been cleared by this machine at the rate of ten dollars the acre; and in some instances large tracts of land which were once thickly wooded, have been rendered stumpless for the small sum of eight dollars the acre, every stump exceeding six inches in diameter being removed.—*Northampton Cour.*

HONEY-DEW.

George W. Johnson, in the Quarterly Journal of Agriculture, after enumerating, and, as he supposes, disproving the several theories which ascribe the honey-dew upon plants to insects and to the atmosphere, traces it we think correctly, to a morbid state of the sap. He says—

"Heat, attended by dryness of the soil, as during the drought of summer, is very liable to produce an unnatural exudation. This is especially noticed upon the leaves of some plants, and is popularly known as *honey-dew*. It is somewhat analogous to that outbreak of blood which in such seasons is apt to occur to man, and arises from the increased action of the secretory and circulatory systems, to which it affords relief. There is this great and essential difference, that in the case of the plants the extravasation is upon the surface of the leaves, and consequently in proportion to the extruded sap, is their respiration and digestion impaired."

The remedy which Mr Johnson prescribes for this disease, for such it evidently is, is a solution of common salt and water, applied to a soil in which the plant is growing. For, says he,

"If we admit that the irregular action of the sap is the cause of the disorder, then we can understand that a portion of salt introduced into the juices of the plant, would naturally have a tendency to correct or vary any morbid tendency, either correcting the too rapid secretion of sap, stimulating it in promoting its regular formation, or preserving its fluidity. And that, by such a treatment, the honey dew may be entirely prevented, I have often myself witnessed in my own garden, when experimentalizing with totally different objects. Thus I have seen plants of various kinds which have been treated with a weak solution of common salt and water, totally escape the honey-dew, where trees of the same kind, growing in the same plot of ground, not so treated, have been materially injured by its ravages. I have noticed that standard fruit trees, around which, at the distance of six or eight feet from the stem, I had deposited, at the depth of twelve inches, a quantity of salt, to promote the general health and fruitfulness of the tree, according to the manner formerly adopted to some extent in the apple orchards of cider countries, that these escaped the honey dew, while infected adjacent trees, just as well as those which had been watered with salt and water. I am of opinion that one ounce of salt (chloride of sodium,) to a gallon of water, is quite powerful enough for the intended purpose."—*Cultivator*.

From the Albany Cultivator.

THE SILK BUSINESS.

J. BUEL, Esq.—Dear Sir—You are aware that I am strong in the faith that this country will ere long, not only supply her own wants in the article of raw silk, but have a large surplus for Europe. You are also aware that I have given much attention to the subject; in fact, have devoted my whole time to it for the last nine years, and that I have plantations for making silk, and factories for working it, and that thousands are now engaged in the same pursuit. Well, sir, notwithstanding all this, we have daily accounts of persons who assert that the whole affair of silk culture is a "humbug." Almost every paper I take up, has something of the

ulation, &c., and advising all within their influence to have nothing to do with it—that "we cannot raise silk in this country, and that it is preposterous to think of it." May I ask you, sir, to permit me the use of your columns to discuss the matter with any or all who make those assertions? My object is, to have the question settled beyond a doubt, and if any of the doubters will favor us with the grounds of their unbelief, in our ability to raise silk, or that we shall not in ten years supply our wants, at least from our soil, I pledge myself to examine the subject fully, and if I cannot answer them, will confess that I have been deluded and have deluded others into the belief, that we can raise silk on all our farms, and to more profit than any other agricultural production, cotton not excepted. I will now assert that we can raise silk cheaper than France or Italy, in any part of our country from Maine to Mexico, of a quality equal to any in the world; and shall esteem it a favor to all who are engaged in the business, in fact to the country at large, if any of your numerous readers will, in reply to this, state *why* we cannot do it, or if they cannot refute the above, then why we shall not seriously engage in the cultivation of raw silk for exportation. SAMUEL WHITMARSIL.

Northampton, Mass., Aug. 8, 1839.

THE SILK COMPANY.—Not many days ago we accepted an invitation to visit the farm formerly belonging to Samuel H. Smith, Esq., about three miles north of this city, and now in the possession and occupancy of the Silk Company which was formed some time ago in this city.

We understood that the capital stock of this company is \$10,000, a moiety of which (500 shares of \$10 each,) has already been paid in. The Silk Company purchased Mr Smith's farm for \$12,000; they have planted about 170,000 buds of the *Morus multicaulis*, and have now growing about 80,000 very healthy trees. The farm is about three miles distant from the centre of the city, and is under the superintendence of an intelligent gentleman, Mr Hand, who resides with his family in the mansion upon the farm. Besides the *morus multicaulis* trees there is a choice and well selected orchard of peach, apple, apricot, pear, plum, and other fruits in great abundance. There are also about eighty acres of wood, a spacious, pleasant, and comfortable dwelling, with all the necessary out-houses and appurtenances of such an establishment.

We are gratified to learn that the Silk Company are much pleased with their purchase and the prospect before them of a profitable result of their enterprise. With the present appearance of the *morus multicaulis* trees on the farm, (which, indeed to our view appeared generally healthy and thriving,) the company are much delighted, believing that all the shareholders will derive substantial benefit.

It is stated to us that the Silk Company contemplate feeding several ounces of silk worms this season; and the next year they intended to feed several pounds of the several varieties, and manufacture a large quantity of sewing silk, the machinery for which they have already procured.

We presume that this information will be acceptable not only to those country friends who are anxious to learn from us what the Silk Company in Washington and the individual cultivators of the *morus multicaulis* are doing, and how the silk cause progresses in the district, but to all others who are

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Sept. 7, 1839.

The show of fruits was very imposing and highly creditable to the contributors: the most ardent and sanguine votaries of Pomona, who witnessed the exhibitions in former years, could hardly have anticipated such desirable results in so short a period of time as has elapsed since the formation of the Society.

Mrs Bigelow, Medford, exhibited splendid specimens of Katerpie Peaches.

Mr Vose exhibited Purple Gage, Imperial Gage, Corsee's Nota Bene, and Duane's Purple Plums; Lady Haley's Nonsuch Apples.

Mr Brimmer, Jamaica Plain, exhibited Nectarines. Mr Oliver exhibited France real d'ete and Washington Pears.

Mr J. G. Coolidge exhibited Coolidge's Favorite Peaches.

Mr Manning exhibited Petit Mirabelle, Efrey, Green Gage, Red Apricot, Peter's Yellow Gage, Bingham, Nota Bene and Byfield Plums; Striped Cherry Apples, Julienne, Gise' Bonne, Hasel, Dearborn's Seedling, France real d'ete, Lowry's Bergamot, Duquesne d'ete, Paysans de Portugal, Sugar and Hoverswerda Pears.

Col. Wilder exhibited Bon Louise d'Jersey Pears; Smith's Orleans and Bingham Plums.

Mr Mitchell exhibited a splendid cluster of Grapes from his green house, Nantucket, weighing 3 1/4 lbs.

Mr S. R. Johnson exhibited Bolner's Washington and White Gage Plums

Mr Tidd exhibited a large basket of Black Hamburg, St. Peter's and White Chasselas Grapes.

Mr Vandine, Cambridgeport, exhibited Plums resembling the Orleans, but said to be a seedling.

Mr J. W. Newell, Charlestown, exhibited Flushing Gage and White Gage Plums.

Mr Pond exhibited Bolner's Washington, Smith's Orleans, Green Gage, White Gage, Duane's Purple, and Isabella Plums; Julienne Pears.

Mr James L. F. Warren, exhibited White Gage, Green Gage and Seedling Plums; Royal Kensington, Royal George and Heath's Favorite Peaches; Prolifuge Figs.

Mr Richards exhibited Summer Pearmain, Pie, Red Juneating, William's Favorite, Yellow Ingestore, Orange Sweeting and Benoni Apples; Bell de Beaucaire and Seedling Peaches.

Among the great variety of fruits, particularly of Plums, were specimens remarkable for their size and great beauty.

On the previous Saturday, Mr F. A. Curtis, Newton, Lower Falls, exhibited fine specimens of Peaches.

For the Committee,

E. M. RICHARDS.

EXHIBITION OF FLOWERS.

Saturday, Sept 14, 1839.

Native plants by Wm. Oakes, Esq., viz: Aster? from Cambridge, Mass.; *Solidago bicolor*, do.; *puberula*, Empetrum Conradi, Aster steptabilis.

Bouquets from the gardens of Wm. Kenrick, Rufus Howe, John Hovey, Wm. Carter, Thos. Mason, Hovey & Co. and S. Walker.

*Dahlia*s by Mr Sweetser, Mr McIntire, Mr Wm. Carter, Mr Stickney, Messrs Breck & Co., Hovey & Co., Col. Wilder, and Samuel Walker. Rival Sussex, by Mr McIntire, was the best specimen presented this season. Hope, and Prisca Donna, in the collection of Mr Wilder, were very fine. The "*unknown*," in the stand of Mr Sweetser, and also presented by Col. Wilder, was beautiful. We were very much pleased with several of the specimens of Messrs Hovey & Co. and Mr Wm. Carter.

Mr W. H. Cowen presented a fine specimen of *Strelicia Augusta*, from the conservatory of Hon. T. H. Perkins, of Brookline. We were much gratified with a sight of this splendid flower, it being the first specimen presented at our rooms, and probably the first specimen seen in the United States.

Mr S. R. Johnson presented Balsams, Asters, &c.

Mr Albert H. Hovey exhibited *Viola grandiflora*, Asters, &c.

BOSTON, WEDNESDAY, SEPTEMBER 18, 1839.

THIRD GEOLOGICAL REPORT OF MAINE—BY
C. T. JACKSON, M. D.

Agreeably to our promise, we revert again to this report; and respectfully state our convictions that the learned geologist has not made out his case by any evidence which he has adduced.

We understand him to state distinctly, that the existence of lime in the soil in the form of a carbonate, is indispensable to the production of wheat; that when this is found, even in very small proportions, as one per cent. of the cultivated soil, there the crop of wheat is sure. (Of course, though he states his proposition thus strongly and universally, we do not understand him to refer to any security from blight occasioned by atmospheric influences or destruction by insects of every kind.) And in the third place, we think it only a matter of fair inference from the opinions expressed in this report, and others given by him in various forms to the public, that he regards the capacity of a soil to produce wheat as bearing (within certain limits,) a direct relation to the degree in which lime in the form of a carbonate is present. Perhaps we do him an injustice by this inference, which we should much regret; but this is certainly the popular conclusion generally made from his expressed opinions. Let us now examine some of the cases which he has adduced; and we beg leave strongly to repeat in this matter, that we protest against any imputation of a captious or controversial spirit in the case, for we feel nothing of it, and entertain no sentiment but that of the most sincere respect for the author of this report; that we have ourselves no theory whatever to establish; and that our only desire is to reach the truth in a subject where sound conclusions are of so much practical importance; and as far as truth, in a matter so mysterious as the hidden processes of vegetation, can by human sagacity be arrived at.

The report presents numerous analyses of various soils. It is understood in all cases, that 100 parts of the soil are taken; and we shall, for the sake of brevity, quote only the amounts of soluble vegetable matter and carbonate of lime.

1. One of the first soils referred to is in page 45, on the Moose River settlement. "The soil is said to this place to be rich and well adapted to cultivation: fifty acres produce twentyone bushels of wheat to the acre. This farm is on the highlands, dividing Canada from the United States. The sides of these mountains are argillaceous slate, [always favorable to wheat. n. c.] while granite rocks probably form their central mass." The Dr. reports no lime, which he would have been sure to have done, we think, could he have found any.

2. Anson (p. 53.) is the next town referred to. This town produced more wheat than any other town in the State. The analysis of the soil on the farm of B. Bryant gave geine, (vegetable matter) 5.6; carbonate of lime 4.6—and the product of his fields has been 30 bushels of wheat to the acre. "This is very remarkable; but there are two other facts to be taken with it. The average yield of wheat *through the town* was only 16 1-2 bushels to the acre; and this field of B. Bryant had been cultivated for years, and barn yard manure had been used for dressing.

3. Norridgewock, (p. 54.) The farm of Dr Bates produced 17 bushels of wheat to the acre. "This wheat had suffered materially from the fly and weevil." We presume it was not manured. Under these circumstan-

ces the crop must be considered large. Vegetable matter in the soil 10.2; carbonate of lime 0.9.

4. Dresden, (p. 54.) Soil a clay loam; average crop of wheat 15 bushels to the acre; vegetable matter 7.6; carbonate of lime 2.5.

5. Thomaston, (p. 58.) Dr. Jackson here found "one of the most luxuriant fields of wheat which he had examined." Yield, however, is not given. Vegetable matter in the soil 8.0; carbonate of lime 2.0. It is to be observed, however, that the farmer had dressed the soil with manure mud and about twelve loads of stable manure to the acre.

6. Orrington and Brewer, (p. 70.) Luxuriant fields of wheat. Orrington—vegetable matter 4.9; carbonate of lime 0.3. Brewer—vegetable matter 7.9; carbonate of lime 1.0.

The Dr. does not give the amount of crops. He says one of the farmers had limed his fields to some extent; but he gives no information to *what extent* or how applied. We know very well how to estimate such indefinite statements of farmers, and in general consider them as worth just nothing. "The soil it seems is composed of 'argillaceous slate rocks, with valleys filled here and there with tertiary clay deposits.'" This we know is exactly the soil for wheat. The Dr. adds that "tertiary clay itself contains from five to ten per cent. of lime, and hence its fertility in crops of wheat." How does it happen that the analysis of the soil shows nothing of this?

7. Foxcroft, (p. 72) "Soil of excellent quality, bearing heavy crops of wheat." Geological aspect—"huge blocks of granite resting upon argillaceous slate." Vegetable matter 11.1; carbonate of lime 0.8.

8. Dover, (p. 80.) Two bushels of wheat sown gave 30 bushels. In another case, one and three-quarters of an acre of wheat gave forty bushels. The Dr. adds, "the soil of Dover is luxuriant and capable of producing heavy crops of grain. It is evident that the occurrence of carbonate of lime as one of its components, is the cause of its remarkable fertility." ☐ Please now to observe the analysis of this very soil—vegetable matter 11.1; carbonate of lime 0.8.

9. Guilford, (p. 80.) "Five acres of wheat produced 100 bushels. But for the Hessian fly and weevil, the crop would have been much larger." Analysis of this soil gives, vegetable matter 11.4; carbonate of lime 0.3.

The Dr. adds in this case a remarkable note—"His field on the opposite side of the road, was last year treated with plaster of Paris as a top dressing; and on half an acre of the land he planted one bushel of wheat, the produce of which was thirty bushels. From this fact it will appear that gypsum exerts a beneficial influence on soils containing a very little lime distributed in clay loam." This seems rather a hasty general conclusion from a single fact. Three-tenths of one per cent. of carbonate of lime is a "very little"; and the gypsum was put on the *previous year* as a top dressing. The amount applied is not given. There is another fact in the case which deserves notice—"The rocks of Guilford are argillaceous slate."

10. Dexter, (p. 85.) B. Green raised of wheat last year 40 bushels to the acre. Supposes he shall get the current year (1838,) 25 bushels per acre. Vegetable matter 10.2; carbonate of lime 1.0. The land by the by was dressed with barn yard manure.

11. Wilton, (p. 106.) Fortyeight bushels of wheat have been produced per acre. "A small quantity of lime is found disseminated in the soil, and hence it is productive of good crops of wheat. The analysis gives of phosphate of lime 1.5, but mark, of soluble vegetable matter 12.0; insoluble 5.5. Are we to understand that this great crop was raised without manure, and why has

he not favored us in so important a case with a fuller notice? *No carbonate of lime is found in this soil.*

12. Union, (p. 160.) This soil is said to have produced forty bushels of wheat to the acre. In table, p. 173, its product is reported as corn; we therefore pass it over as doubtful.

13. Warren, (p. 160.) A good crop of wheat. Vegetable matter 6.6; carbonate of lime 0.8.

11. Sebce village, (p. 161.) A good crop of wheat. Vegetable matter 10.10; carbonate of lime 0.9.

15. Foxcroft, (p. 161.) Good crop of wheat. Soil granite. Vegetable matter 13.9; carbonate of lime 1.0.

16. Minot. "Wheat said to be good." Vegetable matter 4.9; carbonate of lime 0.5.

17. Livermore, (p. 171.) Wheat 30 bushels to the acre. Vegetable matter 8.0; carbonate of lime 0.3.

18. Glenburn, (p. 164.) Wheat good. Vegetable matter 6.3; carbonate of lime 0.7.

The foregoing, we believe, embrace all the examples of the analysis of soils presented in this learned report of the geological surveyor. We shall leave them mainly to speak for themselves. He has not, in our humble opinion, made out his case that the carbonate of lime in the soils is indispensable to the production of wheat; that its deficiency is a sure cause of the failure of the crop; or that the productiveness of a soil in wheat bears any direct relation or correspondence to the amount of lime in the form of a carbonate, which is to be found in every soil.

We stated in our last number that the soil of Mr Adams, in Chelmsford, Mass., which had yielded a crop of wheat nineteen years in twenty, averaging thirty bushels to the acre, contained by the analysis of Dr Dana, no trace of the carbonate of lime. It seems by Dr Jackson's own showing, that the most productive soil in Maine, No. 11, Wilton, which yielded fortyeight bushels of wheat to the acre, [in page 173 it is put down 45 bushels,] contained no lime excepting in a very inconsiderable quantity of 1.5 of the phosphate of lime. These are certainly remarkable facts.

There is another inference to be made from these cases, which will not, we think, have escaped the intelligent reader; which is, that although the productiveness of a soil in wheat does not always correspond to the degree in which the carbonate of lime is present, it does bear a very obvious relation to the amount of vegetable matter contained in any soil and to the application of manure. We can hardly, therefore, accede to the position of Dr Jackson, so emphatically stated in page 153, that it is "proved decisively that lime is the best fertilizer of the soil." We have much question whether in any proper sense it is to be called a fertilizer of the soil at all. To have established his case, it was necessary not to show merely that the carbonate of lime is present in soils where wheat is successfully raised, but that where this form of lime is not found that wheat cannot be raised; and further, he should have shown some correspondence between the crop produced and the amount of this matter present. But where, as in the case of Anson, No. 2, the crop of wheat is 40 bushels, (upon land manured for several years,) though the average crop through the town is only 16 1-2 bushels to the acre; and this soil gives an analysis of carbonate of lime 4.6; and then in Wilton, No. 11, the crop is 48 bushels of wheat to the acre, and *no carbonate of lime is found*, and of phosphate of lime only 1.5, it becomes rather difficult to arrive at the conclusion that the presence of the carbonate of lime in the soil is the great desideratum for the productiveness and security of a crop of wheat.

We shall make a farther claim upon the candor of our readers hereafter in the discussion of this subject.

ANNIVERSARY EXHIBITIONS IN MASSACHUSETTS.

The Mechanics' Fair will be open in Boston on the 23d inst.

The Essex Agricultural Show will take place at Georgetown, on Thursday, the 20th inst. Address by Allen Putnam, Esq., of Danvers.

The annual Exhibition of the Massachusetts Horticultural Society will take place on the 25th, 26th, and 27th inst. at their rooms in Boston.

The Berkshire Agricultural Society will hold their Show on the first Wednesday of October and continue two days. The Massachusetts Society will unite with them. Address by Hon. Josiah Quincy, Jr.

The Middlesex Society of Mechanics and Husbandmen hold their Show at Concord on the first Wednesday in October. Address by Henry Colman.

The Worcester Agricultural Society hold their Show at Worcester, on the second Wednesday in October, 9th day. The Massachusetts Society unite with them.

The Plymouth Agricultural Society hold their Show at Bridgewater, on Wednesday, the 16th of October. Address by Rev. Mr Stone, of West Bridgewater.

CONNECTICUT.—There is to be an Agricultural and Horticultural Fair at New Haven, on the 24th, 25th and 26th of September. Address by Judge Buel, of Albany. There is to be an Agricultural and Mechanics' Exhibition at New London, on the first of October.

TO CORRESPONDENTS.—We have several communications on hand which shall receive our earliest attention. The model of the butter press has been received by the Agricultural Commissioner, and will certainly gain favor. It will go to the Mechanics' Show.

The ploughs have been received by him from Mr Stevens, of Vermont. They are capital in their construction, and from former personal trials with ploughs of this description, and the principles on which they are formed, he believes that they are not and cannot be surpassed by any for the ploughing of green sward. He will, if practicable, have them tried at some one of the ploughing matches.

MASS. HORTICULTURAL SOCIETY.—The Committee of Arrangements are notified to meet at 12 o'clock on Saturday next, 21st inst. A punctual attendance is requested. Per order,
SAM'L WALKER,
Chairman Com. of Arrangements.

BRIGHTON MARKET.—MONDAY, Sept. 16, 1859.
Reported for the New England Farmer.

At Market, 455 Beef Cattle, 750 Stores, 4150 Sheep and 1620 Swine.

Prices.—Beef Cattle.—We quote First quality, \$7 75 a \$8 25. Second quality, \$7 00 a \$7 50. Third quality, \$6 00 a \$6 50.

Stores.—Yearlings \$12 a \$16. Two Year Old \$18 a \$25.

Cows and Calves.—Sales \$30, \$35, \$47, \$55, and \$62.

Sheep.—Dull. Lots \$1 50, \$1 67, \$1 83, \$2 00, \$2 17, \$2 33, \$2 42, \$2 75, and \$3 00.

Swine.—Prices have further declined. Lots to peddle were sold at 5, 5 1-8, and 5 1-4 for sows and 6, 6 1-8, and 6 1-4 for barrows. At retail 6 a 6 1-2 for sows, and 7 a 7 1-2 for barrows.

Massachusetts Horticultural Society.

The members of this Society are hereby notified, that on Saturday, the 5th of October next, at 11 o'clock, A. M. at their hall in Tremont Street, the officers of the Society for the ensuing year, will be elected, viz. a President, four Vice Presidents, a Treasurer, a Corresponding Secretary, a Recording Secretary, a Council, an Executive Committee, and Standing Committees on Fruits, Flowers, the Synonyms of Fruits, the Library, and on Finance.

R. T. PAINE,
Corresponding Secretary and ex officio Recording Secretary pro tempore.

Boston, September 11.

HORTICULTURAL EXHIBITION.

The annual exhibition of the Massachusetts Horticultural Society will be held at the Society's Rooms, No. 23 Tremont Row, (nearly opposite the Savings' Bank) on Wednesday, Thursday, and Friday, the 23th, 24th, 27th September instant.

The Members of the Massachusetts Horticultural Society and the public generally are respectfully invited to contribute choice and rare specimens of Fruits and Flowers for the Exhibition, and to send the same to 23 Tremont Row, on Monday or Tuesday, the 23d and 24th inst., where Committees will be in attendance to receive them, and will retain the same subject to the order of the contributors.

Contributors of Fruits and Flowers are respectfully requested to send a list, with their specimens, giving the names of all the varieties presented.

Season tickets, and tickets for a single admittance, may be had at the door during the exhibition.

By order, **SAMUEL WALKER,**
September 11. Chairman of Com. of Arrangements.

Morus Multicaulis Trees from Seed.

The subscriber offers for sale 10,000 trees produced from seed of the genuine *Morus Multicaulis*. The seed was raised on his premises in 1835; the trees have been multiplied for the two last years by layers, their growth is more rapid than in the open tree, and appear to be sufficiently acclimated to endure the winter, some of them having been left standing in the open field unprotected during the two last winters without any essential injury. The leaves are very large and equal in quality to any other kind for feeding the silk worm. Those who are wishing to purchase a superior kind of Mulberry are requested to call and examine for themselves, before the foliage is destroyed by frost.

Harvard, September 11.

MULBERRY TREES.

The subscriber has on hand a quantity of Mulberry Trees of a quality which is probably superior to any kind ever introduced into this country. They were imported four years since and though they have sustained the rigorous cold of the last three winters entirely unprotected, yet it is believed a Southern or Western climate would be more admirably adapted to their growth and propagation. Their foliage is most luxuriant and affords more nourishment than any other variety. Silk produced by worms fed with the leaves, has been pronounced by judges to be the best ever manufactured by them, and decidedly superior to the best Italian. A few thousand will be

* LIME. By a law passed by the Legislature of Maine, at its last Session, the size of the Casks and the inspection of this article was altered. The act went into operation on the first of August last—the casks now contain about one quarter more than formerly and are more uniform in appearance. The price has advanced and we have altered our quotations accordingly. Sales 500 a 1000 casks at 1 20 per cask the past week. Further sales of Thomaston new inspection, have been made at the quoted rate.—*Courier.*

THE YANKEE GIRL.

She laughs and runs a cherub thing,
And proud is the doating sire,
To see her pluck the birds of spring,
Or play by the winter fire.
Her golden hair falls thick and fair,
In many a wavy curl;
And freshly sleek is the ruddy cheek
Of the infant Yankee girl.

The years steal on and day by day,
Her native charms expand,
Till her round face beams in the summer ray
Like the rose of her own blest land.
There's music in her laughing tone,
A darker shade on the curl,
And beauty makes her chosen throne
On the brow of the Yankee girl.

She is standing now a happy bride.
At the holy altar rail,
While the sacred blush of maiden pride
Gives a tinge to the snowy veil,
Her eyes of light is the diamond bright,
Her innocence the pearl;
And these are ever the bridal gems
Of a happy Yankee girl.

A Negro Fiddler.—A negro man was going through the woods with no companion but his fiddle, when he discovered that a pack of wolves were on his track. They pursued very cautiously, but a few of them would sometimes dash up and growl, as if impatient for their prey, and then fall back again. As he had several miles further to go, he became much alarmed. He sometimes stopped, shouted, and drove back his pursuers and then proceeded. The animals became more and more audacious, and would probably have attacked him had he not arrived at a deserted cabin which stood by the way side. Into this he rushed for shelter, and without waiting to shut the door, climbed up and seated himself on the rafters. The wolves dashed in after him, and becoming quite furious, howled and leaped, and endeavored with every expression of rage to get at him. The moon was now shining brightly, and Cuff being able to see his enemies, and satisfied of his own safety, began to act on the offensive. Finding the cabin full of them, he crawled down to the top of the door, which he shut and fastened. Then removing some of the loose boards from the roof, scattered them with a tremendous clatter upon such of his foes as remained outside, who soon scampered off, while those in the house began to crouch with fear. He had now a large number of prisoners to stand guard over until morning; and drawing forth his fiddle, he very good naturedly played for them all night, very much, as he supposed, to their edification and amusement; for, like all genuine lovers of music, he imagined it had the power to soften even the heart of a wolf. On the ensuing day some of the neighbors assembled and destroyed the captives, with great rejoicings.—*Hull's Notes on the Western States.*

Hunting Deer by Steam.—We have heard of boots being blacked, clothes washed, love letters written, and butter churned by the application of steam; but we never before heard of deer being caught by the same omniscient agent. The steamer

Naomi on her last passage down the Mississippi, encountered a fine large buck swimming in the middle of the river, and immediately gave chase. Having soon come up with the enemy, she rounded to and threw out grappling irons; but the deer leaping out a reef in his topails, scudded away from their reach. Now commenced a regular and interesting trial of skill. The deer doubled and tacked with the skill of an old privateer. At length the deer, wearied at his exertions, and dismayed at his persevering adversary, surrendered himself an unconditional prisoner of war, and was treated with great honor and attention at a public dinner given on board the next day.—*St. Louis Bulletin.*

Effects of Sleep upon the Eyes.—A due portion of sleep is as essential to enable the eyes to perform their office comfortably and effectively, as a due portion of rest is to enable the limbs wearied with toil, or the mind with reasoning, or other kind of exertion, to resume with alacrity their wonted offices. But sleeping, too long protracted, on the other hand, is hardly less destructive of accurate, healthy vision, than when taken too sparingly; for as in the one case the organ is enfeebled by unremitting activity without a proper degree of repose, so in the other case, the eye from unrequited or insufficient exercise, becomes torpid and dull, and if inaction be persisted in, it is at length unfitted for its functions.—*Curtis on the Eye.*

Lying.—There is no vice so pitiful, so contemptible as that of lying. He who permits himself to tell a lie once, finds it much easier to do it a second and third time, till at length it becomes habitual; he tells lies without attending to it, and truths without the world's believing him.

Though you cannot see when you take one step what will be the next, yet follow truth, justice and plain dealing, and never fear their leading you out of the labyrinth in the easiest manner possible.

If a person is bent on quarrelling with you, leave him to do the whole of it himself, and he will soon become weary of his unencouraged ceasation.—Even the most malicious ram will soon cease to butt against a disregarding object, and will usually find his own head more injured than the object of his blind animosity.

Exercise.—Exercise is generally considered too omnipotent; and relying upon its restoring power, people run into every kind of extravagance in living, apparently in the firm faith that an evening or a morning ride will fully indemnify them against any deleterious results from such excesses. They seem to think that late hours, excessive drink, and gluttonous eating, may all be indulged in with impunity, if they will but occasionally submit themselves to a gentle jolting in a carriage, or the almost imperceptible motion of an ambling nag. Exercise is indisputably a capital assistant in the preservation of health, but, without the concurrent aid of a temperate and prudent course of life, it is but a broken reed to lean upon for the promotion of a healthful state of either body or mind.

Hard Currency.—"Musket balls full bore," were a legal tender in Massachusetts in 1656, "current for a farthing apiece, provided that no man be compelled to take above 12 at a time of them." In 1650, the town of Hingham paid its taxes in milk pails.

Morus Multicaulis Shoes.—We presume that Hartford can boast the latest application yet of the far-famed *morus multicaulis*—being nothing less than than the manufacture of shoes.—We have just been shown a lady's shoe, full sized and handsomely finished, made from a *morus multicaulis* leaf. The advantage of shoes made from this article is, that after they are worn out, they are as valuable as ever—they will still do to feed worms.—*Hartford Cour.*

Hale's Patent Horse Power and Patent Threshing Machine.

JOSEPH BRECK & CO. offer for sale this valuable machine and feel great confidence in recommending it as the best machine now in use. It will thresh from 75 to 100 bushels per day in the best possible manner. The horse power is calculated to propel any kind of machinery, is very simple in its construction, occupies but the small space of one feet by two, and can easily be transported from one place to another, and when combined with the Threshing Machine it forms the most superior article for the purpose ever invented. They can be supplied at short notice at the N. E. Agricultural Warehouse and Seed Store.

August 23.

New York Urate and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are not divided among the Stockholders, as are those belonging to another establishment, but sold to applicants for cash on delivery. Orders are supplied in the order of time in which they are received. Urate 50 cents and Poudrette 40 cents per bushel, with contingent charges for bags or barrels, &c.

The company are daily preparing for use, during the warm, dry weather, the materials collected during the past winter, and will have several thousand bushels ready before the first of October next. The material is disinfected and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1833 and 1839, on Long Island, has satisfied many of the farmers that these manures have the quickest operation upon vegetable matter, producing greater abundance, and the cheapest of any manure they have ever tried. Amended instructions for their use, the result of practical experience, will be furnished on application. The effect of Poudrette upon Grape Vines and *Morus Multicaulis* is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manures, and farmers and gardeners may confidently rely on a supply. Orders, post paid, directed to "The New York Urate and Poudrette Company," Box, No. 1211, Post Office, New York, or sent to the store of STILLWELL & DEY, No. 365 Fulton Street, Brooklyn, will be attended to.

The Company will be very much obliged to gentlemen who have used the manures, to give them a statement in writing what has been the result of their use and experiments in relation to them.

New York, August, 1839.

Multicaulis, Alpine and other Mulberries.

WILLIAM PRINCE & SONS, proprietors of the Linnaean Nurseries near New York, are ready to receive orders to any extent for all the varieties of Mulberries, including the Chinese Multicaulis, American, and from the seeds of an ever hardy European, Elata, Alpine, Canton, Broussa, Rose of Lombardy, Daudou, Pyramidalis, &c., the six first named of which surpass all others and are placed in rotation according to merit. The prices will be moderate and terms easy, and priced Catalogues will be sent to every one desirous of purchasing. Fruit and Ornamental Trees and Shrubs, Green House Plants, Bulbous Flowering Roots, Field and Garden Seeds, Roban Potatoes, &c., can be supplied, and priced Catalogues will be sent to every applicant.

September 4.

TO WOOL GROWERS.

For sale a full blood Leicestershire Ram, 3 years old this spring; was imported into this country in May, 1839, by the present owner. This ram is particularly valuable to towns, and produces extraordinary long wool of the best quality. Apply to JOSEPH BRECK & CO.

AGRICULTURAL.

From the Cultivator.

THE AGRICULTURAL STATE OF SCOTLAND.

And what has that to do with American husbandry? it may be asked. Much, we reply. We may learn from what Scotland was, and what she is in agriculture, many useful lessons in farming. *We may learn our own errors in practice; and, if we are not too proud, or too conceited, we may learn, from Scotch lessons in farming how to correct them—we may learn from them how to double at least, the products of our agricultural labor. The history of Scotch agriculture for the last fifty years, is invaluable to every farmer who would improve his practice. History is wisdom, teaching by example.

We find a valuable essay in the Edinburgh Quarterly Journal of Agriculture, showing what Scotland was, and what she is, in regard to her agriculture. She was, in 1784, two years after the close of our revolution, "as poor as a church mouse." She is now, perhaps, the richest in agricultural products, of any portion of Great Britain, at least so far as regards her arable lands. The writer describes the face of the country at the middle of the last century, "no better than that of a bleak, howling wilderness," and well, he adds, might the poet at the inn window indite—

{
"Bleak are thy hills of north,
Not fertile are thy plains,
Bare-legged are thy nymphs,
And bare — are thy swains."

"In 1784, a few gentlemen, full of zeal for their country, and it may be a little love of society, formed themselves into a sort of hole and corner club, in a coffee-house called the Exchange, situated in the court of that name, near "the market cross of Edinburgh." Here, in the enjoyment of agreeable conversation and a good supper, did those worthies talk over plans for the amelioration of the Highlands, and from this nucleus arose the now widely extended and powerful Highland Society."

"To say what was the state of agriculture in Scotland at the date of the formation of the Highland Society, would, to treat of it minutely, require greater scope than the limits of a periodical admit."

"But, to take one sweep over hill and dale, corn-field and meadow, we may at once pronounce the agriculture of Scotland, at that period, to have been wretched—excessively bad in all its localities. Hardly any wheat was attempted to be grown; oats full of thistles was the standard crop, and this was repeated on the greater part of the arable land, while it would produce twice the seed thrown into it: turnips, as part of the rotation of crops, were unknown: few potatoes were raised, and no grass seeds or clover were sown. The whole manure of the farm being put on a little bit of ground, near

can recollect, a great part of the summer was employed in the now fertile shire of Fife, in pulling thistles out of the oats, and bringing them home for the horses, or mowing the rushes and other aquatic plants that grew on the bogs around the homestead. Such was the state of Scotland, with but little appearance of amendment, up to 1792."

The general outline of this picture of wretched husbandry is suited to the present condition of many districts on the eastern borders of our country, though the filling up of the picture would require to be somewhat different.

"Time, with her ceaseless wing, had now brought in another century, and on the arrival of the nineteenth, the richer part of the low country had put on another aspect. Beautiful fields of wheat were to be seen—drilled green crops and clean fallows every where abounded—the bogs had disappeared—the thistles no longer existed. In the Lothians, all this was carried on to a great extent. The farmers forgot themselves—they were coining money, and 'light come, light go,' was their motto. They went on in the most reckless manner—they began to keep greyhounds, to be members of coursing clubs, subscribed to the 'silver cup,' or 'puppy stakes,' and yelped the same note of folly as their betters in birth, their equals in extravagance and vice. Then followed yeomanry races—the good sturdy nag that would be of use at a time in the operations of the farm, was exchanged for a blood steed, and on market-day, instead of rational conversation about matters connected with their own calling, they began to talk 'knowingly' about the turf. At this time, that is, from 1810 to 1814, the agricultural horizon was the brightest; the gas was fully up, the nation was alive, all was activity and business."

But at this time the battle of Waterloo came, and with it peace and low prices. Farmers could not sustain their extravagance—they had been unable to bear prosperity—and their farms fell into the hands of more prudent managers. We have seen much of the same routine of industry, extravagance and poverty, among the farmers of our own country. Not willing to 'let well enough alone,' they have embarked in speculation, or in pursuits to which they were strangers, and have gone into extravagances and follies, to ape the great, which their means did not warrant, and which neither their comfort nor the welfare of their children required. The consequence often has been, that, like the indiscreet Scotch farmer, their lands have come into the possession of more prudent managers.

But though Scotch farmers failed, from not knowing how to bear prosperity, Scotch husbandry did not retrograde.

"In 1815, the turnip husbandry had got a firm hold in the country—the benefit accruing from it

of driving their cattle to a distant market. Two discoveries removed these impediments. The first, "the most important," says our author, "that ever occurred in the annals of agriculture, viz., that of bone dust," and the second, the application of steam, by our countryman, Fulton, to the propelling of vessels, which enabled the Scotch farmer to transport his fat animals to Smithfield market, at a moderate expense. "So palpable was the benefit to be derived from the use of bone manure, that in a few years there was not a farmer who did not avail himself of it. The farmers could now grow turnips to any extent, and the bare fallow was exploded."— "We have bone dust, and pondrette, and other newly discovered means of fertility, which the farmer is shy of buying and using. We have tried them all, and are satisfied both of their utility and the economy of their application, especially upon naturally dry or well drained soils. They add much to the products of agricultural labor, without any thing like a corresponding outlay. The Scotch farmer could now grow turnips to any extent. He could fatten upon these his stock, and he could send this stock to market at a trivial expense, for the "steam engine had become his drover."

But another—a third improvement followed, which we have yet to learn the value of—we mean furrow draining on flat and tenacious soils. Hear what our author says upon this subject:

"No man holding land ought to be ignorant of the thorough or Deanston drain. Mr Smith, deeply engaged in the cotton spinning trade, could not procure a fall of water on the river Teith, ten miles west of the castle of Sterling, without renting along with it a considerable portion of very bad and wet land. Not liking to have a heavy rent to pay for such trash, Mr Smith turned his powerful mind to the subject, and perceiving the folly of throwing away large sums of money on deep and useless drains, with all the stuff of tapping and boring, to catch the water as it were a wild beast for which gins and traps must be laid, hit on the idea of making drains in parallel lines in the hollow of every ridge, cutting them to the depth of thirty inches, filling them with small stones half way to the surface, above this putting a green turf reversed, and replacing the mould. Following up his first discovery by ploughing deep, he has now a farm of the finest land ever seen; and so convinced is the writer of the utility of this mode of draining, that each year he has been increasing the quantity he has made, and during the last twelve months has put in above fifteen miles. Nor is the Deanston drain confined to those parts of the country where stone or gravel can be procured: the same system can be and is followed with the same effect, by using the Marquis of Tweeddale's tile; or even the poorest farmer, who has not capital to undertake costly improvements, can fertilize his farm by mak-

clays are converted into turnip soil, and even that would formerly have been accounted dry, is advanced in quality. Whole parishes in the vicinity of Stirling are completely transformed from unsightly marshes into beautiful and rich wheat fields, and where the plough could scarcely be driven for slush and water, we see heavy crops per acre and heavy weight per bushel, the quantity and quality alike improved."

"It is the greatest quantity produced at the cheapest rate that will ever make a prosperous trade. If wheat is low in price, the farmer must bestir himself. Let him remember that if he can but grow one or two quarters more per acre, he will be in a better position, even with the low price, than he was before."

In speaking of the Highland Society, the writer enumerates the following means which that Society adopted, as contributing largely to the mighty advance of the agriculture of Scotland:

"In the days of its youth and feebleness, the Highland Society sent the leaven of the turnip husbandry into all the glens and straths of the north, by offers of small prizes to certain Highland parishes; and the same may be said as to the growth of clover and the finer grasses. As it advanced in strength, (as to numbers and to cash), attention was turned to premiums for stock; then came offers of reward to men of science to discover better implements and machines, to diminish friction and consequently draught, such as in the thrashing mill and other parts of agricultural machinery. Still advancing in the scale of intellect and of science, premiums were offered for essays to bring to light the facts connected with chemistry and natural philosophy; and, under the auspices of the society, was set up the Quarterly Journal of Agriculture, a work which has been the vehicle of conveying so much useful information to the agriculturist, that we hunbly venture to say it ought to appear on the table and book shelf of every farmer's parlor. After this, the great stock shows were resolved upon as another link of union between the society and the practical farmer, at the same time throwing aside all paltry feeling, and making them open to stock from both sides of the Tweed, [i. e. from England as well as Scotland.] How well they have succeeded, let the last one at Glasgow bear witness. [This was the most splendid show of fine cattle ever exhibited.] Nor has the society forgotten the beauty of the country, as the premiums offered in regard to planting trees and such like subjects fully testify; and to sum up all, it may be said, the Highland Society has been a *point d'appui*, a rallying point, to which the agriculturists of Scotland might look, and a fostering mother to all who, although strong in talent, were weak in interest to make it public. An ardent lover of the plough and all that can speed it, the writer of this article would advise the society of England, and all other agricultural societies who would be useful to their country, to look into the annals of the Highland Society, and from them to cull whatever may be of use in the advancement of the delightful science, the culture of the fields.

"The men
Whom nature's works can charm, with God himself
Hold converse; grow fruitful r' day by day
With his conceptions; act upon his plans,
And form to his the rest of their souls."

The Highland Society have this year offered prizes to the amount of \$17,000, under the following classification:

Class I.—Agricultural machinery, 500 sovereigns and a gold and silver medal.

Class II.—Essays and reports on various subjects, embracing thirtone subjects of high interest to the farmer, viz:

1. Geological surveys.
2. Reports on coal districts.
3. Mines and minerals.
4. Products of peat moss, &c.
5. Comparison between different kinds of manure in raising potatoes.
6. Extended application of water and other power to farm purposes.
7. Comparative efficacy of the two modes of thorough draining.
8. Reports on irrigation.
9. Forest planting.
10. Sheep pastures at high elevations.
11. Improved sheep salve.
12. On crossing the Cheviot with the New Leicester ram.
13. Cultivation of the recently introduced cereal and other grains.
14. Feeding farm horses on raw and prepared food.
15. Early rearing and fattening of lambs.
16. Insects injurious to agricultural plants.
17. Insects injurious to forest trees.
18. Comparative nutritive properties of grasses.
19. Extirpating ferns from pastures.
20. Thorough-draining.
21. Subsoil ploughing of thorough-drained land.
22. Mole plough.
23. Experiments with manures.
24. Analysis of bone or rape dust.
25. On the effects of altitude on vegetation.
26. Feeding of cattle.
27. Forests of larch.
28. On raising improved varieties of grains.
29. Reports on improved rural economy abroad.
30. Honorary premium for reports on certain districts in Scotland.
31. Investigation of certain points connected with the science of agriculture, viz:

An essay or memoir explaining on scientific principles, the mode in which soil operates in producing or facilitating the germination and growth of vegetables.

An essay or memoir describing and proving, on scientific principles, what is the best admixture of the ordinary elements of soil, for promoting the germination and growth of particular vegetables.

An essay or memoir describing, on scientific principles, the mode in which lime operates in rendering the soil better adapted for the germination and growth of particular vegetables.

An essay or memoir explaining, on scientific principles, the effect of drainage in altering the constitution or qualities of the soil, and increasing its fertility.

An essay or memoir, showing the nature of the atmospheric influences on soil, in promoting its fertility, including the modification of these influences arising from heat and cold, dryness and moisture.

Class III.—Waste lands—their improvement by tillage.

Class IV.—Crops and culture.

Class V.—Pastures—their management.

Class VI.—Live stock—district competitors.

Class VII.—Products of live stock—butter and cheese.

Class VIII.—The best kept cottages and cottage gardens.

Class IX.—Woods and plantations.

Class X.—General show of live stock and agricultural meeting at Inverness.

Having shown, by our quotations, something of the vast extent of the recent improvements in the agriculture of Scotland, and the influence which its agricultural society has had in promoting these improvements, we have given the above sketch of their premiums, as indicating the means they have adopted, and are adopting, to bring about this great and salutary change—to show how vast a field they occupy, and the great bearing which science is made to have in the improvement of the soil, and in the operations of the farm.

BERKSHIRE AND OTHER HOGS.—HARDINESS OF DURHAM CATTLE.

We offered the belief some weeks ago, that the Berkshire hogs, although a very superior breed for family pork or for slaughtering and packing on or near navigable streams, are not good travellers.—This was mere matter of opinion, from observation of the animals, which have remarkably short legs and bodies, as well as from the statement of Mr C. N. Bennett, of Albany, N. Y., one of the oldest breeders of them in the United States, concurring in the same opinion, and which was published in the first volume of this work, page 307. We suppose a full blood Berkshire hog has never been driven to the South, and we do not know of a lot of mixed bloods having gone. We think it likely the cross of the Berkshire upon the long legged breeds would produce a fair travelling animal, and one uniting other excellencies. We have received several letters from breeders suggesting the propriety of a revision of our opinion as to the travelling capability of Berkshire hogs; but, till better advised, we must adhere to the opinion. We would thank the gentlemen to furnish us some facts on which we would be justified in, remodelling our present opinion; and such facts would be exceedingly interesting to others too. We have been acquainted with this breed of hogs nearly as long as any one else in this State, and have now a fine lot of mixed and full bloods; but never heard, till lately, that they were a good travelling breed. But if they are, they have still higher claims to public estimation. We can truly say, that on the farm, they are the busiest hogs we have ever seen; but do not deem this any evidence of ability to travel to the south on their short legs, bearing such enormous barrels, through the deep mud of winter. Those who are breeding hogs are interested in knowing the truth, not only as to this but all the qualities of hogs; and we would be glad to have the opinions, but more particularly the experience of others on the matter.

In point of form, the Berkshire is superior, in our opinion, to any other breed we have seen—but this is only our opinion. For thrift we deem them equal to any, and as to hardness, inferior to none—two more opinions, based somewhat upon observation and experience, however. We have tried all the popular breeds but the Russia and Irish; (which we propose yet to try), and so far as our own preferences are fixed, we prefer the Berkshires for family pork and for slaughtering and packing, but the Woburns or Bedfords for travelling. These are preferences which are based, however, more upon opinion than upon satisfactory or conclusive tests,

and which are worth just as little and just as much as any other unverified opinions—and they may go for what they are worth. We have never heard, nor still less entertained a doubt that the Irish hogs are fine travellers.

Whether this or that breed of hogs is the best for this or that farmer, depends upon various considerations—position with reference to market—are they to be slaughtered and packed at home or to be driven abroad—the mode of keeping—the kind of food, &c. &c., all which every reflecting farmer will duly appreciate. Coarse boned animals, of all kinds, the world all over, are known to be less thrifty than those of fine bone. If hogs therefore are to be slaughtered at home, we should prefer those of fine bone; but if the hogs are to be driven a long way to market, and the bone be too fine and the legs too short for travelling, the coarse boned hog must be adopted of necessity. But the judicious breeder well knows how to secure, in the greatest compatible degree, all the desired qualities, by crossing; and why should we feel a sort of partisan spirit in regard to any particular breed which does not possess all the qualities desirable? The fact is, we none of us know enough in relation to any of the breeds, to justify dogmatic conclusions as to their superior fitness for all purposes, it is true we have some well-founded opinions derived from experience and which serve to guide us often to very favorable results; but we have not all the data by which to test every mooted question arising in this branch of rural economy. Facts—indisputable facts—the well attested results of skillful, accurate and thorough experiments, are what we want before we can decide the superior value of this or that breed of animals and lay down immutable laws for the guidance of breeders. We know of no such experiments having been made in reference to the relative qualities and value of various breeds of hogs. It is true every breeder who has several breeds, forms his opinions, and for the soundness of which he can give substantial reasons, sufficient to govern himself and influence others; and we doubt not these opinions and reasons are the best which could be derived under the circumstances of their formation; but the most eminent breeders arrive at different conclusions in relation to the same breeds. Hence we say different circumstances are to be taken into account, and that they are not duly weighed and ascertained by accurate experiments in seeking definite conclusions. Dr. Martin (if he will pardon the unauthorized use of his name and practice,) is making some experiments upon the relative thriftiness of the Berkshire and Woburn hogs, by putting an equal number of each in the same sty and feeding them alike.—These are young hogs, highly fed, and the experiment so far, is decidedly in favor of the Woburns. Well, this experiment will teach some facts pretty clearly, but still we doubt whether it is an entirely fair one in view of testing the question whether the one or the other breed, upon the whole, is the most valuable and profitable breed. It may be shown, indeed, which class of animals, fed in the same sty, takes on more flesh in a given time; but it does not show at what additional cost of food the gain is obtained; nor indeed, is an experiment of stuffing pigs at all a satisfactory mode, to our mind, of settling the question. It would be, if it was the

true gain (upon known quantities of food) at all seasons and upon the ordinary modes of feeding generally practiced. An experiment which shows what may be effected by a mode of husbandry which cannot be adjusted to the circumstances of the country, although it may lead to rational conclusions, is not the most valuable for general usefulness. We do not know what is the final result of Dr. M's experiment, or indeed whether it is satisfactorily completed; but we should be glad to hear, and particularly to know the cost as well as the result. We know of an experiment which was made with the same breeds, last winter, in the ordinary method of keeping stock hogs, which resulted greatly in favor of the Berkshires; but in neither case do we know whether the gain obtained by each breed, under the differently conducted experiments, was had at the cost of food and labor, equivalent or more than equivalent to the value of the gain. If one animal gains fifty pounds in the same time that another gains forty, and upon the same quantity of food, there can be no dispute as to the superiority of that animal; but if he consumes an amount of food more than the other, equal in value to his excess of flesh, his superiority consists only in the *quickness* with which he fattens. Some animals take on flesh much more rapidly in some periods of life than in others. This aptitude manifests itself in some breeds early, and in other, late in life. There is said to be a breed of pigs at the north, which mature sufficiently for slaughtering at nine months old; but these are stuffed in the sty, we presume, from the start. Under this treatment any breed of ordinary thrift, would do the same; but this treatment cannot be adopted in Kentucky. The whole system of stuffing, in reference to calves as well as pigs, we regard as affording no useful information, except in developing an aptitude to fatten quickly. It is a system which cannot be adopted in general practice; and the fat calves and pigs which we see at the fairs—who can tell us whether the labor and food expended in fattening them is not worth more than the animals would bring in the shambles? This is at last the true test of things; and it is important that such experiments should be made and the results accurately recorded. In this view of the subject, we have sometimes thought that no premiums ought to be awarded at our fairs, except upon animals whose owners produce accurate statements of the mode and expense of keeping and the amount gained upon the food consumed. If any of our Kentucky breeders have made such experiments and kept their accounts accurately, we should be extremely glad to publish their statements.

We find also, that some of the experienced breeders do not admit the correctness of our opinion, published some weeks ago, that Durham cattle are less hardy than the native stock. On this subject we earnestly desire enlightenment; and if experimental facts are offered, showing that this invaluable race is capable of enduring the rigors of winter and the stint of food under which the common stock of the country are sustained, one of the most serious obstacles will be removed and their spread will be much more rapid. We do not at all entertain the unfavorable opinions on this subject affected by many; but at the same time we were candid in the belief that the native stock possess

SALTING BUTTER.

On some occasions, a part or the whole of the butter may, perhaps, be disposed of fresh; but in general it must be salted before it can be carried to market. And as this part of the process requires as great attention as any other, a few remarks on the subject shall be added.

Wooden vessels are, upon the whole, most proper to be employed for containing salted butter.—These should be made of cooper work, very firm, and tightly joined with strong wooden hoops. It will be advisable to make them very strong where circumstances permit them to be returned to the dairy; for as it is a matter of considerable difficulty to season new vessels so well as that they shall not affect the taste of the butter, it is always advisable to employ the old vessels rather than make new ones, as long as they continue firm and sound. Oak is the best wood for the bottom, and staves and broad Dutch split hoops are to be preferred to all others when they can be had. Iron hoops should be rejected, as the rust from them will in time sink through the wood, though it be very thick, and injure the color of the butter; one iron hoop, however, should be put at the top, and another below beyond the bottom, the projection below the bottom being made deep for this purpose. No form is more convenient than that of a barrel, unless, perhaps, it be that of a truncated cone, with the apex uppermost; as in this case the butter never can rise from the bottom and float upon the brine, which it will sometimes do in the under part of a barrel when brine is necessary. But this inconvenience may be easily obviated, by driving a wooden peg with any kind of a head, into the bottom before it be filled, as the butter, closely embracing the head all round, will be kept perfectly firm in its place.—An old vessel may be prepared for again receiving butter, by the ordinary process of scalding, rinsing, and drying; but to season a new vessel requires greater care. This is to be done by filling it frequently with scalding water, and allowing it to remain till it slowly cools. If hay or other sweet vegetables are put into it along with the water, it is sometimes thought to facilitate the process. But in all cases frequent effusions of hot water are very necessary, and a considerable time is required, before they can be rendered fit for use. The careful dairyman ought to be particularly guarded with respect to this particular, or he may soon lose his character at market.

After the butter has been beaten up and cleared from the milk, as before directed, it is ready for being salted. Common salt is almost the only substance that has been hitherto employed for the purpose of preserving butter; but I have found by experience, that the following composition is, in many respects, preferable to it, as it not only preserves the butter more effectually from any taint of rancidity, but makes it also look better and taste sweeter, richer, and more marrowy, than if the same butter had been cured with common salt alone. I have frequently made comparative trials with the same butter, and always found the difference much greater than could well be conceived. The composition is as follows: Take of sugar one part, of nitre one part, and of the best Spanish great salt, or best rock salt, two parts: beat the whole into a

Mr Calvin Haskell's Farm, Harvard, Mass.

We notice the farm of this gentleman on account of the experience he has had in the mulberry and silk line. This farm is well-situated for the raising of trees and the production of silk, being located on high ground with a western aspect; the soil a good black loam, pretty free from stones, with a fine smooth surface. It is a well known fact that the frosts hold off in the autumn two or three weeks longer on high swells of land than in the valleys; consequently the young wood of the trees is better ripened and prepared to stand the winter without injury. The principal varieties cultivated by Mr Haskell, are the common white and a variety raised from seed of the *morus multicaulis*. He purchased two of the last named trees soon after their introduction into the country, planted them out and suffered them to remain through the winter; these survived two winters and perished the third; but the third season they produced 30 or 40 berries; these were saved with great care and planted the following season (1836) from which were raised about 500 trees, with leaves of various sizes and shapes, but generally resembling the mother plant, and in many cases a very near approach to it. The result has been that he is in possession of a variety to all appearance hardier than the parent, and equally valuable in point of weight of foliage. As a proof of its hardiness, part of the trees have been fully exposed for two winters—even the roots were made bare in some cases, and they did not suffer so much as those placed in the cellar. So well satisfied is he of this, that he intends to plant out an acre the next season for feeding worms, to remain undisturbed through the winter. They are propagated with as much ease as the parent tree. He has trees over six feet high from the layers this year, and about 15,000 of this variety. We often hear it said that the *morus multicaulis* will become acclimated eventually; but experience, as far as our own observation goes, and the opinion of a number of cultivators of good authority, proves the reverse; that by continued propagation by cuttings or layers, it becomes more tender. We see an example of this kind in the worthless Lombardy poplar, which was in every body's ground twenty-five years ago. It was easily propagated from the cutting, and in no other way were the trees produced; the consequence has been, that it has completely run down and enfeebled. The only prospect of acclimating the *morus multicaulis*, in our opinion, is by raising a few generations of plants from seed, and probably Mr Haskell has made some approach to this desired result.

For feeding worms he has depended principally upon the white mulberry: of these he has about 3000, mostly cultivated in hedges, about four feet distant from each other in the row, and from five to nine years old. Until a more hardy variety has been thoroughly tested, we do not think it wise to reject the common white, surely not for the *multicaulis*. Selections may be made from a lot of seedling white mulberries, which have leaves nearly as large as those of the *Broussa*. The best varieties of the *Broussa* to all appearance now, will supersede the white. As near as we can learn, what is called the Alpine is only a superior variety of the *Broussa*: we have not been able to find any other difference; if there is, we should like to know wherein the difference consists. Mr Haskell has now been a producer of silk for five years, but has

labored under great disadvantage until the present season, in consequence of not having a suitable place for feeding his worms: last year they were very much injured by keeping them in a hot garret not well ventilated. He has now erected a convenient cocoonery, 35 feet by 25, two stories high—each story containing four tiers of shelves with six in a tier, and capable of accommodating 500,000 worms. He will have of this year's raising from 150 to 1 1/2 lbs. of cocoons, and might have produced more if he had been disposed; but the plan he adopts is to spare his young trees and not stun them too close, as he considers it poor economy to do this until they are well established. He calculates that 1000 worms will make four pounds of cocoons, and that it requires from 10 to 12 lbs. of cocoons for 1 lb. of reeled silk. He raised this year three broods of worms; the first hatched out the first of June; the second the middle of June, and the third the first of August. The last brood however, did not succeed well, as they suffered from the cold nights; for the future he intends to have none come out later than the middle of July, so that the worms shall all have finished their work by the first of September. Mr Haskell does not devote himself exclusively to his farm, as he is engaged in trade.—He supplies his customers with sewing silk of his own manufacture, which is generally preferred to the imported. From the success which has attended his first efforts and the prospect before him, Mr Haskell feels encouraged to pursue the business, with the assurance that it will prove a profitable one in the end.

Some of our readers may think we have occupied too much of the paper of this and the last week, on this subject; but it has been our desire to record what has fallen under our own observation for the encouragement of others. There has been so much misrepresentation, humbuggery, and deception practised upon the subject, that we have been seriously afraid our farmers would become disgusted and give it up in despair. We trust this will not be the case without further trial. It is gratifying to learn that considerable is doing the present season in the silk business in New England, independent of raising trees for sale, and that those who have experimented and devoted themselves to it the longest and of course ought to be the best judges, are fully persuaded of its final success. The great excitement which now pervades the country in relation to the sale of trees is an unnatural one raised by speculators, and will probably end in the disappointment and ruin of multitudes or we are much mistaken. Those whose object has been to raise silk, and have not made their calculations to become suddenly rich, will, we think, have their anticipations fully realized; but let them have patience, and not be in too much haste to keep worms until their trees will bear sufficient foliage without stripping them to death.

Improvements of the farming interest in Pepperell.

For twenty years past we have been somewhat acquainted with the state of agriculture in this and the neighboring towns. In this place we spent twelve years of our life: having been absent from it for the last eight years, we were in a situation, on a recent hasty visit, to form some estimate of the progress of agriculture in this part of Middlesex county. To a resident who has his eye continually upon the slow march of improvement around him, it will not appear so conspicuous as to those who have been absent. We noticed in comparing

the present appearance of the farms with what they were 20, 15, or 10 years ago, that a marked and decided change for the better has taken place.—The improvements consist in better husbandry, more comfortable and better finished dwelling houses and barns, a greater abundance of shade and ornamental trees, together with a general appearance of independence and thrift. In saying this, we would not be understood that there is no chance for improvement left: very far from that; the farmers have hardly begun to look up, comparatively speaking. The surface of the town is agreeably diversified with hills and valleys, and well watered by the Nashua on its southern border, the Nissitisset running through it, and other living streams of minor importance, giving life and beauty to the scenery, otherwise interesting and pleasant.

The upland soils are mostly brown color, intermixed with argillaceous slate, the decomposition of which gives fertility to it, and when stimulated with the due proportion of manure, gives large returns, and is highly favorable for corn, wheat and other grain, as well as for all sorts of fruit.

We find that much more wheat has been raised of late years than formerly. We were told by one gentleman that he raised last year 28 3/4 bushels to the acre, and this year the produce will probably be greater: as it had not been threshed out he could not give us a statement of the present crop; but when this is done, an account of his mode of cultivation with the quantity raised may be expected. On another farm we were shown a field of fine ruta bagas, part of them having been manured with bone manure and the remainder with ashes: those manured with the bone manure were the most luxuriant. Many of the farmers have commenced the cultivation of roots for their cattle and hogs, a thing unknown a few years since: no doubt, as they see the beneficial effects of roots upon their cattle and farms, their cultivation will be more general and on a larger scale. We were informed that an extraordinary crop of rye was raised the present year on some light intervalle land. The land was prepared by first sowing a crop of clover seed, which produced a good burden, and to the astonishment of his neighbors, the proprietor ploughed it in and sowed his rye. Probably they thought him almost insane to waste so fine a crop of clover, but he had read of such an operation before if he had never practised it.

On another farm we examined an orchard which had been set out about 18 years: the soil a dry, stony one. The owner was of opinion that trees planted in cultivated ground were forced ahead too fast and more liable to decay, and had taken an opposite course and kept his land down to grass. The trees were very healthy and vigorous—had been taken good care of, and a small space round the body of the tree kept clear of grass. To compare them with Mr Phinney's, noticed a few weeks since, reared in cultivated ground, and as to soil about on the same footing as to fertility, and planted nearly the same time—we should say it was best to keep the ground cultivated: how they will compare twenty years hence we cannot say; but at the present, Mr Phinney's are twice or three times as large and produce four times the fruit. It is true, however, that while Mr Phinney lost quite a number of trees by the severity of the cold winters, those we now examined stood unharmed. This orchard had been ploughed up and planted with corn the present season, and has produced a luxuriant crop; probably from 50 to 60 bushels per

here: it was manured in the hill with a compost made of three parts of meadow mud and one of barn yard manure. There are many farms we should like to notice in this town, but we have not time at present, but as we have had some encouragement from a number of gentlemen, we hope to hear through them more from the Peppercell farms.

J. B.

SWINE IN A FRUIT ORCHARD.

Mr Phillips, in a letter published in the *Memoirs of the Pennsylvania Agricultural Society*, thus speaks of the beneficial results of allowing swine to run among fruit trees:

"For several years past my family have been supplied with the finest plums by a neighbor, who is the only person I know of who has had uniform success with them. Last year while his trees were in full bearing I carefully examined them, particularly as respected their culture and local situation, and I found that no uncommon pains had been taken with them—on the contrary they appeared neglected, as numerous dead and broken limbs hung about them; and that the very great success he had, could only be attributed to their situation, which was at the place where the hogs lay and were fed. He told me that the hogs never let a plum remain that had fallen, many minutes undevoured, and thereby destroyed the insects that hung about, and the larvae in them, and that of late very few insects had appeared about the trees."

We can bear testimony to the efficacy of swine in fruit orchards, in destroying the curculio, or the insect that so much injures the plum and the cherry. We have two cherry trees standing where pigs lie, and are fed, and though not as favorably situated as many others on our premises, in other respects, they uniformly produce the finest cherries grown on our trees. After the cherries begin to ripen, there are few hours in a day in which the trees are not visited by the pigs, and every worm, stone and cherry are at once disposed of. On our other trees the curculio does much mischief annually—on these the fruit is nearly exempt, and is decidedly larger and fairer than on those to which the swine have no access. In planting plum or cherry orchards this fact should not be forgotten; and pigs should have the free range of such premises.—*Genesee Farmer*.

USE OF LIME.—Lockhart, in his *Life of Sir Walter Scott*, relates the following anecdote: "There see," he continued, "that farm there at the foot of the hill is occupied by a respectable enough tenant of mine: I told him I had a great desire for him to try the effect of lime on his land. He said he doubted its success, and could not venture to risk so much money as it would cost.—Well, said I, fair enough; but as I wish to have the experiment tried, you shall have the lime for the mere carting: you may send to the place where it is to be bought, and at the term-day you shall strike off the whole value of the lime from the rent due to me. When the pay day came, my friend the farmer came with his whole rent, which he laid down on the table before me without deduction. 'How's this, my man? you are to deduct for the lime, you know.' 'Why, Sir Walter,' he replied, 'my con-

From Prof. Jackson's Third Report on the Geology of Maine.

AGRICULTURAL GEOLOGY.

As I have formerly stated, it is evident from an examination of the mineral ingredients of soils, that they all originated from the decomposition and disintegration of rocks which for ages have been acted upon by air and water; those agents having, by their mechanical and chemical powers, shattered and crumbled the solid ledges into those pulverulent matters which form the basis of all soils—to which, subsequently, small quantities of vegetable humus are added by the decay of plants.

Ancient soils.—There have been various epochs in the earth's history, when soils were thus formed, and after bearing their luxuriant vegetation, were reconverted by aqueous and igneous causes, into rocks, the structure and fossil contents of which, denote their origin to have been from sedimentary matter, hardened by pressure and heat. Thus, when we look back to the epoch of the transition formations, we find the rocks composing that series to be composed of agglomerated sand and pebbles, cemented by clay, which presents itself in an indurated form, the result of igneous action. Marine shells, contained in the graywacke rocks just described, evince that this deposit was chiefly formed beneath the waters of the sea, while some portions of it were deposited in fresh water, as proved by the presence of certain plants, peculiar to bogs and lakes. The slates of this formation contain prints and casts of numerous plants, such as ferns, equisetaceae, lepidodendron and stigmaria; while beds of anthracite coal showing by their structure and composition their vegetable origin, are also included between the strata.

Now it is evident that the above mentioned plants could not have grown without a soil, and the rocks in which they are imbedded bear every proof that they were once in that condition.

Secondary soils.—We come next to the secondary epoch, and here again we are astonished to find proofs of a numerous succession of alternating beds of soil, each having, for long periods of time borne their perennial verdure of intertropical plants, allied to those above noticed, but more complicated and perfect in their structure. The sandstones and shales of this formation are vast herbaria of ancient vegetation, and their strata contain, well preserved between their sheets, perfect impressions of numerous genera of plants, the species of which are now extinct. Large trunks of trees are also exposed by opening coal mines and quarries of sandstone, while the numerous and reiterated strata of coal itself also bear ample proofs of their vegetable origin.

Here, then, we have another epoch at which soils existed, produced their abundant vegetation, stored the earth with fuel, and then were reconverted into solid rocks, to be again subjected to the wear and tear of elemental strife.

The *tertiary epoch* was of a milder character, and but little disturbance of the solid rocks appears to have been effected during those submersions when the plastic clay, calcareous marls and strata of perfectly preserved marine shells, were deposited. These sedimentary matters appear to have resulted from a slow and gradual deposition of clay and oth-

When we consider the several periods which I have briefly mentioned, it will at once reveal to any reflecting person, that the world has been during the lapse of innumerable ages, subject to great revolutions in its geological organization. At one time, the rocks are worn down into soils, and bear their vegetation—then continents were sunk in the ocean's depths, and subsequently were raised again, the soils having in the mean time been converted into rocks. By such consideration, we soon learn to respect the antiquity of the world; and knowing that such records are legibly written on the tablets of stone, we feel a natural desire to read and understand their meaning.

Ancient alluvial soils, or diluvium.—Subsequent to the epochs of which I have spoken, we find that another scene of violence disturbed the tranquillity of the great deep, and the northern ocean was hurled with its seas of ice, over the land, sweeping the loose materials from the very mountain tops, and depositing them far south of their former resting places—while the grooves, scratches and water marks upon the surface of the fixed ledges, show the direction in which the current passed. By such a flood, proofs of which are nearly universal in Maine, as elsewhere, the soils were transported and commingled, so that we rarely find a soil similar to the rocks beneath it, but identical with that derived from other rocks which occur to the north and northwest. Having already cited so many localities in proof of this position, I shall not here recapitulate, and the intelligent observer will find so many illustrations in Maine to satisfy his rational curiosity on the subject, that he need not long remain in doubt as to the facts.

Modern alluvial soils.—The present causes which act upon the solid rocks, are both chemical and mechanical. Oxygen, from the atmosphere and from water, is constantly affecting some portions of the work, especially where the rocks contain pyrites. Rivers, torrents, brooks, and even rain, are gradually sweeping away the solid rocks by their continued action; but more powerful than all others, is the action of freezing water, which, by its almost irresistibly expansive force, rends all rocks into which water can find a passage, and crumbles down those which are porous in their structure.—Upon the coast, the sea ever beating the solid rocks and hurling the loose fragments with the force of battering ordnance against the shores, wears away the ledges, the detritus being either spread out on the bottom or sifted up at the mouths of harbors and estuaries.

Alluvial soils are produced by the transportation of fine particles, by aqueous agency, from higher sources, and are especially brought down and deposited during freshets, when a river bursts its confines, and being diminished in its velocity, deposits its sedimentary matter over the intervals. The force of the wind is also constantly removing fine particles of soil from one district to another, and the dust of ages is of greater importance than is commonly believed. Enough has been said on this subject to excite inquiry, and to stimulate others to look over the pages of nature, for their own satisfaction, and this is all that can be expected from introductory remarks, such as I now offer to the reflecting observer.

BOSTON, WEDNESDAY, SEPTEMBER 25, 1839.

SILK PRODUCTION AND MANUFACTURE.

The subjoined letter from a highly valued and intelligent friend is so encouraging in regard to the production of silk, that we give it to the public with great pleasure. It was not designed for publication; but we have no knowledge of any experiment where the results seem so decisive and emphatical.

The sample of silk referred to has been received, and is of a beautiful description. It has been seen by several competent judges, and universally admired. It will be exhibited at the Mechanics' Fair in Quincy Hall, and we commend it to the attention of the interested and curious.

H. C.

5th September, 1839.

Mr H. COLMAN—Dear Sir—I have produced 600,000 silk worms' eggs, of excellent quality, from two varieties of worms—the common brown worm with sulphur cocoon, and the large white worm with pea-nut cocoon. So far as I am acquainted, the latter is very superior, and is so considered, especially by Whitmarsh, who says the silk is worth one quarter more than any other. The fibre is long, fine, and beautiful, and valuable for fine fabrics. If you should meet with demands for silk worms' eggs, I will forward them to your order with great pleasure. They are deposited on sheets of foolscap, and can be enclosed in a letter. We have also a small collection of Mulicaulis trees. Unfortunately I was induced to purchase *Alpine* cuttings, which, owing to the hardness of its wood and the cold season, was almost an entire failure; and of the Mulicaulis kind less than one-half vegetated. Under all these unfavorable circumstances I believe I shall nevertheless be able to give a good account of my stewardship.

The experiments I have been able to make have been most satisfactory, and the practical knowledge I have acquired, most useful to me. I have carried my plan through without the slightest drawback, and have given a practical demonstration that with ordinary intelligence and careful management, the culture of silk is as feasible as the culture of Indian corn. Every step in the business was new to me, and all my information was drawn alone from books.

From the cocoons remaining or those not pierced by millers, we are now extracting a beautiful quality of silk—a specimen of which I intend to offer for premium at the next exhibition of the Massachusetts Charitable Mechanic Association, if you can do me the favor to present it for me, as I cannot personally attend to it. I shall offer it for competition as the *best reeled silk*, and in this important branch of the business we have had every thing to learn, for I never saw a silk reel except the one I use, which is of my own construction. This instrument is exceedingly simple, and performs its work in the finest manner, and I should be happy if I knew any person who could use it, to exhibit it also. I believe its simplicity would commend itself to the favorable notice of judges, as being the best machine of the kind, and peculiarly adapted for family use. Its movements are the same as the famous Piedmontese reel.

The reeling of silk is a very delicate operation, yet it is one that patience and industry will easily surmount. I believe you will be surprised to see the specimens reeled in my room, for indeed I am surprised myself. When several months since you asked me why I did not direct my attention to the silk culture, I had no idea

how much I could accomplish. I supposed it would require years of practice to produce cocoons, and further than this, I thought I never should step. That is, I did not think it possible without great skill to produce a *merchantable* article of reeled silk. But the whole process is well suited to the intelligence of New England, and blessed as we are by the most favorable climate in the world, it will be strange indeed if we do not become a silk growing people. We can feed successive crops from the middle of May to the middle of September, without artificial heat. All Europeans agree that the cocoons of this country are of extraordinary size, and produce double the amount of silk over those of France or Italy; and they all further concur in the fact, that in every stage of the business, we possess superior advantages, and that there are no obstacles to our producing silk to an immense amount and of the best quality. I should be very happy to spend the summer months in producing silk, and it would be my pride to obtain *reeled* silk of the finest quality. I sent a small parcel to Philadelphia, for which I was offered \$7 50 a pound—a higher price than *reeling* silk of domestic produce commands.

Trees of foreign origin are yet dear, yet I think under no contingency can an orchard be produced so cheap as to purchase trees and multiply them by cuttings. I do not mean that I think they will command present prices, but one thing I consider certain; that should the culture of silk become a staple business, trees will consequently bear a good price. It is my determination to follow up the business with spirit if at all. The outlay for lands, buildings, and trees need not be very considerable, in comparison with that required for most enterprises.

Will you please to say whether it will be quite convenient for you to enter my specimens of reeled silk at the fair, and state where I may send it. I am so vain as to think you will take pleasure in bringing my first attempts into notice.

CREEPING WHEAT—(*Triticum repens*.)

Our correspondent N. L. is desirous of calling things by their right names; and requests us to inform him whether a certain grass, usually deemed a great pest by farmers and gardeners, which has a sort of polygynous life and starts from every joint, is to be called witch grass or twitch grass. We answer that this plant is a perfect *alias*, and known in almost every town by a different cognomen. In some places it is called, as he says, twitch grass; in some twitch grass; in some Sprague's grass; in some joint grass; in some places and among a set of men (we shall not say where they live,) who get suddenly in a passion, and use hard names, it is called devil's weed—for certain folks are always fond of affectionate associations, and of remembering their intimate friends on all occasions. But none of these names are half so respectable as the true botanical name, by the use of which we hope our friend's conscience will hereafter be relieved; that is, *Triticum repens*, or Creeping Wheat.

H. C.

NEW MODE OF RAISING VEGETABLES.

Mr Stanley Carter, of North Wrentham, under date of September 10th instant, informs us that he has discovered a process of forwarding vegetation, by which, he says, vegetables can be brought to maturity in three fourths of the time usually required for that result. He is of opinion that great improvements are not effected always and exclusively by master minds, as those of a Newton and a Franklin; but often by the most secluded and humble operators in the community. In this we entirely agree with him, and shall most heartily con-

gratulate him, if by any fortunate discovery through his skill, observation, and experience, he is able to confer such a benefit upon the agricultural world as his communication would lead us to suppose.

We understand his letter as an offer to make known to us, upon certain conditions, the process by which he is able to produce the results he specifies. We shall be happy to hear farther from him on the subject; but as he has not made known the precise boon which he proffers, nor the conditions on which the offer is made, we must wait for farther information.

H. C.

¶ We beg leave to say to "I. A. J." that his communication in a previous paper addressed to H. C., was received in our absence; and we had not the pleasure of reading it until we saw it in print. We have only to say to him that we shall be happy to hear from him as often as he will be kind enough to favor us; and we hope that will be very often. The manuscripts have likewise been received, for which he will accept our thanks. We wait only for a moment of leisure to have the pleasure of a perusal.

H. C.

LOWELL HORTICULTURAL SOCIETY.

The first exhibition of the Lowell Horticultural Society took place at Mechanics' hall on Wednesday, the 19th inst. It gave us much pleasure to be present and witness the first offerings to Flora and Pomona. From the spot which has marked the formation of this society, and the result of its first effort, we anticipate that it will become an object of much interest and usefulness to the city of Lowell and vicinity. As we take a deep interest in the dissemination and cultivation of fine fruits and flowers, we hail with pleasure its existence, and shall at all times be pleased to extend to it the right hand of fellowship.

The show of flowers was very good considering the recent organization of the society—much better than could have been expected. The dahlia appeared the most prominent among the floral tribe: some fine specimens were exhibited by a number of contributors; there were also numerous bouquets and cut flowers, peculiar to the season. The fruit consisted of apples, pears, peaches, plums, grapes, melons, &c. of which there was a good display, reflecting much credit upon the cultivators in the neighborhood; many of the specimens were of the first order. Overgrown squashes, pumpkins, and other large vegetables were to be seen as usual on such occasions. A bushel basket of large Rohau potatoes was exhibited, raised from twenty eyes, some of them weighing 1 1/2 lb. each. The hall was thronged with ladies and gentlemen, apparently well pleased with so successful a commencement. In the evening an address was delivered on the occasion by the Rev. J. L. Russell, which we did not hear, as it was necessary for us to return before night; but from his well known ardent love of Horticulture, and his perfect knowledge of Botany, no doubt it was well adapted to interest and instruct his audience, and encourage them to persevere in their efforts to promote a taste for the cultivation of fruits and flowers in Lowell and vicinity.

J. B.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Sept. 14, 1839.

The show of fruits at the hall of the Society have thus far been uncommonly good for the season.

Mr Manning exhibited Gravenstein Apples; Golden Beurre of Bilboa, Styrian, Buffum, Beurre of Mons, of the London Horticultural Society, and Belle Lucrativa

Pears: Prune d'Agon, Diamond, Violette, Renne Claude, and the French Long Blue Plums.

Mr Pond exhibited Julienne, Cushing, St Glisham and Williams' Bon Chretien, (Bartlett of Boston) Pears; Green-Gage, Lombard and Corse's Field Marshall Plums

Col. Wilder exhibited Corse's Admiral Plums, and Remsen's Favorite: a breaking, sweet, but not highly flavored Pear

Mr Jacob Deane, of Mansfield, sent in the "Superb Sweet" and "Spice Apples, also large "Early" Peaches

Mr Warren exhibited the Julienne Pear and small Early Figs

White Peach, natural fruit, probably the Brattles White, which can generally be reproduced from the stone, was sent from the garden of Mr Burroughs.

Isabella Grapes, open culture, from Mr Parker.

Seedling Peaches, of good size and fine flavor, were exhibited by Mr Richards.

White, or Flushing Gage, from Mr J. W. Newhall
White Sweetwater and Black Hamburg Grapes;
small yellow Plum, unnamed, and the Bromfield Nectarine, from Mr T. Mason.

The well known "Yellow Egg" Plum, of a large size, measuring 7-3-4 inches in diameter, was sent from the garden of Mr Samuel Lamson.

Williams' Bon Chretien and the Cushing Pears, were exhibited by Mr Fisher, of Brookline.

Apples, unnamed, from Mr Henry Sheafe.
Julienne Pears, from Mr Warren.

For the Committee,

JOHN M. IVES.

At a meeting of the Horticultural Society on Saturday, the 21st inst., the thanks of the Society were voted to TURKELL TUFTS, Esq., of Medford, for his valuable and acceptable donation to the Society of a complete set of Abbott's History of Plants.

Messrs John Clark and George Hallett, of Boston, were admitted subscription members.

BRIGHTON MARKET.—MONDAY, Sept. 23, 1859.
Reported for the New England Farmer.

At Market, 725 Beef Cattle, 540 Stores, 4550 Sheep and 675 Swine. A large number of Beef Cattle unsold.

PRICES.—Beef Cattle.—Prices have further declined and we reduce our quotations. First quality, \$7 25 a \$7 75. Second quality, \$6 50 a \$7 00. Third quality, \$5 50 a \$6 00.

Stores.—We continue our former quotations, viz. Yearlings \$12 a \$16. Two Year Old \$18 a \$28.

Cows and Calves.—Sales \$35, \$42, \$48, \$50, \$55, and \$60.

Sheep.—Dull. Lots were sold at \$1 50, \$1 71, \$1 88, \$2 12 \$2 25, \$2 37, \$2 62, and \$3 25.

Swine.—A short supply was at market and advances were effected. Lots to peddle were taken at 4, 4-1-4 and 4-1-2 for sows, and 5, 5-1-4 and 5-1-2 for barrows. At retail 6 a 6-1-2 for sows, and 7 a 7-1-2 for barrows. A few choice pigs for 1-2 cent more.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northerly exposure, week ending September 22.

SEPT., 1859. | 6 A.M. | 12 M. | 6 P.M. | Wind.

A Young Man Wanted on a Farm.

The advertiser is in want of a *smart young man* that is well acquainted with the cultivation of *vegetables*, and one that is also capable of taking charge of *horses, cows and swine*, one that understands it, *he must be energetic, active and fond of neatness and order*; he must produce evidences of a *good moral character*. Such a person may find a permanent situation by calling on Messrs BRECK & CO No. 37. None need apply but such as answer to the above. September 25

A FARMER WANTED.

A man and wife or a single man are wanted to carry on a Farm about 14 miles from Boston, for which reasonable wages will be paid. None need apply but Americans and those that are acquainted with Farming and Gardening. First rate recommendations will be required for honesty and sobriety. Please apply at this office. September 25.

Great Auction Sale of Morus Multicaulis Trees.

On the 1st October next, at PRINCE'S Nurseries, Flushing, near New York. William Prince & Son have concluded, for the purpose of more general dissemination, to offer a part of their stock for sale, as follows.

150,000 splendid Trees of the genuine Morus Multicaulis 25,000 Large Leaved Albino Mulberry, very hardy. 50,000 Rese of Lombardy Mulberry, and a few thousand of the New American Multicaulis, raised from genuine seeds. The leaves are very large, and the tree exceedingly hardy.

The terms will be very liberal for notes or mortgages, and every tree will positively be sold, without reserve, to the highest bidder. The trees will be sold on the ground, with all their branches and very large roots, just as they stand, and a few thousand trees will also be sold of new and extremely rare varieties of the Mulberry, not to be found in any other establishment. September 25.

Massachusetts Horticultural Society.

The members of this Society are hereby notified, that on Saturday, the 5th of October next, at 11 o'clock, A. M. at their hall in Tremont Street, the officers of the Society for the ensuing year, will be elected, viz. a President, four Vice Presidents, a Treasurer, a Corresponding Secretary, a Recording Secretary, a Council, an Executive Committee, and Standing Committees on Fruits, Flowers, the Synonymy of Fruits, the Library, and on Finance. R. T. PAINE, Corresponding Secretary and ex officio Recording Secretary pro tempore. Boston, September 11.

Morus Multicaulis Trees from Seed.

The subscriber offers for sale 10,000 trees produced from seed of the genuine Morus Multicaulis. The seed was raised on his premises in 1855; the trees have been multiplied for the two last years by layers, their growth is more rapid than the original tree, and appear to be sufficiently acclimated to endure the winter, some of them having been left standing in the open field unprotected during the two last winters without any essential injury. The leaves are very large and equal in quality to any other kind for feeding the silk worm. Those who are wishing to purchase a superior kind of Mulberry are requested to call and examine for themselves, before the foliage is destroyed by frost. HARVARD, September 11.

MULBERRY TREES.

The subscriber has on hand a quantity of Mulberry Trees of a quality which is probably superior to any kind ever introduced into this country. They were imported 40 years since and though they have sustained the rigorous cold of the last three winters entirely unprotected, yet it is believed a Southern or Eastern climate would be more admirably adapted to their growth and propagation. Their foliage is most luxuriant and affords more nourishment than any other variety. Silk produced by worms fed with the leaves, has been pronounced by judges to be the best ever manufactured by them, and decidedly superior to the best Italian. A few thousand will be for sale if immediate application is made to the subscriber, where specimens may be seen. Also—a few hundred Morus Multicaulis and Asiatic.

JOHN N. BARBOUR, September 11. No. 30 Commercial Street, Boston.

Northern pulled.

From the Knickerbocker.

OUR MOUNTAINS AND VALLEYS

"God of our fair, extended plains,
Thy sweet green fields contented be,
Thy mountains rise, like holy towers,
To hold communion with the sky!"

Penthu

The mountains and the valleys wide,

Of our bright native land;

In all their bright green loveliness,

How gloriously they stand!

The white clouds built on azure skies,

Like palaces and towers,

The spanning rainbow's brilliant arch,

Formed of the sun and showers!

The creeping breeze that floats in waves

Far o'er the flowering rye,

And purple hills, with clover buds,

Reposing blushing;

Rich are the fields with bearded grain,

Where the broad valleys run,

To meet the mountain ramparts blue,

Gilt by the cheerful sun.

Of shadowed into darker spots,

Beneath the floating cloud,

Of gleaming with a rosy tinge,

Where mantling forests crowd;

All o'er the waving, graceful line,

As furth it sweeps along,

Sweet, varied into lofty peaks,

And deep dells, filled with song.

Down midst the slopes, the village spires,

Are rising among bowers,

And o'er each dwelling's garden wall.

Break forth the truant fowls.

And here are all the economy

That grace our happy soil;

Who bid it smile thus beautiful,

Beneath their cheerful toil.

The plough, and scythe, and harrow come,

And eradle, in their time,

And spread the boon of plenty round,

Within our changeful clime:

'Tis God that gives the sun and shower,

The soil, and forest shade,

And husbandmen make joyful here,

The lovely world He made.

HORTICULTURAL SOCIETY.—We visited twice yesterday, the exhibition of fruits and flowers at the saloon of Niblo's Garden. It is truly a choice exhibition, embracing numberless varieties of plums, peaches, nectarines, melons, grapes, &c. &c. &c., both of rare kinds and uncommon dimensions.

The display of dahlias is truly gorgeous—the extent and variety of the collection and the tasteful disposition of the flowers, exceeding by far, any former exhibition.

The specimens of fruit and the flowers, are for the most part arranged upon a long table in the centre of the saloon. The vegetables, of rare sorts and enormous size, upon tables along the sides.

The gentleman whose contributions are the most extensive and various, is Alexander Walsh, Esq., of Lansinburgh. And to his taste the society is indebted for a very appropriate and beautiful ornament at the head of the saloon. It is what Mr W. has fittingly named the horticulturist's coat of arms,

forming a pyramid twenty-four feet high, constructed entirely of the various instruments of horticulture. A thermometer, handsomely decorated, is placed in the centre, with the motto, "SCIENTIA DIRECTS OUR MOVEMENTS." The spider, rake, hoe, &c. &c., covered with a wreath of evergreens, and decorated with a superb variety of dahlias, rare exotics, and native flowers, form the frame work of this fanciful device. From the most prominent parts of the structure are suspended filberts, hazle, madder root, wood, sumac, perennial flax, &c., all produced by Mr Walsh, emblematic of the aid horticulture affords to manufactures. The silk business is fully represented by the eggs, reeled silk, and a tasteful display of cocoons and wreaths of the silk moth. Near the centre of the structure the grape, and that which maketh the heart glad, corn, oil and wine, are justly represented.

The pedestal, some thirty feet long, is loaded with some fifteen or twenty varieties of plums, also apples, pears, filberts, a profusion of choice and rare vegetables, and we may here also mention, a diminutive bee hive and a sun-dial.

On the right, a little raised from the pedestal, are placed a variety of rural engravings. Copies of the New York, New England, Michigan, and Genesee Farmer, the Cultivator, and other publications, fully to complete this gardener's budget, have likewise been placed upon the table.—Mr Walsh's motto being, "Non ulla civitas que bricondo?" "I am as useful even when sportive."

Amidst all this beautiful display we are not only chagrined, but provoked, to find that the New Yorkers, the cultivators of fruit and flowers in this city, and its environs, have been so backward on this occasion. While Mr Downing, and others, of Newburgh, Messrs Holbrook, Kneeland, and others, of Dutchess co., Messrs Gen. Stephen Van Rensselaer, Judge Buel, Isaac Dennison, and others, of Albany, and Mr Walsh, of Lansinburgh, have taken such pains to favor us with choice specimens of their horticultural labors, we have not more than two or three exhibitors of fruit, and as many more of flowers—none, we believe, from Long Island or New Jersey. Our friends from the country have done very handsomely on the occasion, but the coldness of the city and its environs is chilling to their feelings and enterprise. It has struck us also, that our contemporaries of the press have been unusually backward in stirring up our citizens to the importance of this most interesting and beautiful department of practical political economy.

We cannot enumerate the exhibitors either of fruits or flowers this afternoon, and must await the secretary's report. The most inviting and beautiful nectarines that we have ever seen, are from Mrs Van Rensselaer, of Albany, and we think the choicest looking peaches are from Mr Kneeland's garden in Hyde Park.

The annual discourse is to be delivered this afternoon at half past 4 o'clock—a most unfortunate hour—in the saloon, by WILLIAM EMERSON, Esq. The elegant scholarship of Mr Emerson warrants the expectation of an able and finished performance. But a small portion of our papers will be distributed at that early hour; but we nevertheless entreat all who see the notice—the ladies especially—to attend.—V. Y. Com. Adr.

There recently arrived at New York one bull and ten full-blooded short-horned Durham cows—imported by Henry Clay, for his farm at Ashland, Ky.

New York Urate and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are not divided among the Stockholders, as are those belonging to another establishment, but sold, to applicants, for cash on delivery. Orders are supplied in the order of time in which they are received. Urate 50 cents and Poudrette 40 cents per bushel, with contingent charges for bags or barrels, &c.

The company are daily preparing for use, during the warm, dry weather, the manures collected during the past year, and will have several thousand bushels ready before the first of October next. The material is disinfected and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1838 and 1839, on Long Island, has satisfied many of the farmers that these manures have the *quickest* operation upon vegetable manure, producing abundance, and the *cheapest* of any manure they have ever tried.

Ample instructions for their use, the result of practical experience, will be furnished on application. The effect of Poudrette upon *Grape Vines* and *Vitis Mutiliculis* is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manures, and farmers and gardeners may confidently rely on a supply.

Orders, postpaid, directed to "The New York Urate and Poudrette Company," Box No. 1241, Post Office, New York, or sent to the store of STILLWELL & DEY, No. 365 Fulton Street, Brooklyn, will be attended to.

The Company will be very much obliged to gentlemen who have used the manures, to give their statements in writing, what has been the result of their use and experiments in relation to them.

New York, August, 1839.

Hale's Patent Horse Power and Patent Threshing Machine.

JOSEPH BRECK & CO. offer for sale this valuable machine and feel great confidence in recommending it as the best machine now in use. It will thresh from 75 to 100 bushels per day in the best possible manner. The horse power is calculated to propel any kind of machinery, is very simple in its construction, occupies but the small space of one feet by two, and can easily be transported from one place to another, and when combined with the Threshing Machine it forms the most superior article for the purpose ever invented. They can be supplied at short notice at the N. E. Agricultural Warehouse and Seed Store.

August 23.

BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 37 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for carting or carting.

Also, Ground Oyster Shells.

Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.

2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.

3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.

4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$2 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS,

17 SOUTH STREET—BOSTON.

AGRICULTURAL.

From the Cultivator.

NOTES ON NEW JERSEY FARMING.

A recent visit to New Jersey has enabled us to see more of its husbandry than we have before witnessed in passing across the State by the ordinary routes of travel, and to judge better of its capacities for agricultural improvement. The few remarks which we have to offer, are the result of incidental observations which we were enabled to make on our passage from Newark to Trenton, and from Burlington, through Bordentown, Hightstown, Freehold, Shrewsbury and Middletown to Keyport on Amboy Bay.

New Jersey is very advantageously situated for marketing the products of her soil. Surrounded, except on her northern border, by navigable waters, with several boatable streams coming from the interior, and two canals and two railroads extending from her eastern to her western border, the agricultural productions of the State may be sent to either New York or Philadelphia in a few hours, and converted into money; and a great many farm productions which are perishable, or which would not bear the expense of ordinary inland transportation, are thus rendered sources of immediate and substantial profit. Thus, for instance, the fruits and garden productions of the valley of the Delaware, where the season is earlier than on the Atlantic border, are sent off in the afternoon by the railroad, and are in the New York market the next morning before sunrise, in excellent condition. We returned, a part of the route, in what is termed a *truck* train, which, before it reached Hightstown, or the half-way station, consisted of eighteen cars, filled principally with melons, peaches, and other garden truck. The facilities for transporting lime, marl, manure, &c., are equally advantageous.

The soil of those parts of New Jersey through which we passed, is mostly sandy, frequently with a tenacious subsoil. The surface in the interior is gently undulating, but more so near the eastern and western borders; while a ridge, extending from southwest to northeast, may in some parts be called hilly. Many of the lands are consequently too much saturated with water in the spring, and in wet summers, for profitable husbandry. When laid dry, these lands are wonderfully improved by the application of lime or marl, aided by ordinary manures. We were shown a farm of this character, which the present owner purchased a few years since at seven dollars an acre, and which he had since drained, marled, &c., and which was now considered worth \$125 an acre. We examined the crops on another farm, and they were fine, which a short time since was purchased for about the same price, and which is now estimated to be worth \$100 an acre. It may be still much improved by underdrains and a further application of fertilizing materials.

The defects in New Jersey farming seem to have been the same as have too generally prevailed

in all the Atlantic States—a system of continued cropping, without regard to draining, manuring, or alternating crops. The fact seems to have been but little known, or little regarded in old time, that plants, like animals, feed and fatten—not upon mere earths—but upon the organic matters in the soil—and that every crop taken from a field diminishes its fertility. Another fault in New Jersey, as well as in American farming generally, has been, spreading the farming capital and farm labor over too broad a surface—in cultivating one hundred acres poorly, instead of cultivating ten, twenty or thirty acres well—the returns and profits of the latter generally exceeding those of the former, of which New Jersey herself exhibits many notable and highly commendable examples. Draining is essential, in many places, to the healthy growth of clover, in which New Jersey farming seems very deficient; and indeed all grass seed are too much neglected. We saw several fields which had been cropt with corn and rye, and turned into pasture without grass seeds. We suspect that another defect in New Jersey husbandry is, the small number of neat cattle which are reared and fattened. In this matter, the Jersey farmers might learn a useful lesson from the neighboring counties of Pennsylvania, where lean cattle are purchased in autumn and fattened upon roots and coarse grain, for the great markets. They leave upon the farm the elements of fertility to the soil. If the products of the farm are consumed upon it, that is, the hay, straw and roots, and the dung carefully husbanded and applied, the fertility and profits of the farm will certainly, under a suitable alternation of crops, progressively increase. But if these products are all carried off, and nothing returned, sterility will certainly ensue. Dung feeds crops, crops feed and fatten cattle, and cattle manufacture dung. We have another example to offer to our Jersey friends, of the facilities of enriching their lands. We called upon a gentleman upon the confines of their State, W. A. Seeley, Esq., of Staten Island, who has a farm of 200 acres, which he has brought into an excellent condition from an unimproved state. His crops were all well matured and fine, and he showed us piles of surplus manure, estimated to contain 2500 loads, composed of yard dung, peat earth, peat ashes, sea-weed and fish, all furnished by his own farm and his own shores. Such is the effect of capital and skill judiciously applied. We will not say we saw the *best* corn growing upon these grounds—but we think we saw *as good* as we saw any where in New Jersey. The Jersey and Dutton corn were growing side by side; and we are promised a statement of their relative products.

The means of fertilising the lands of New Jersey are abundant, the facilities of procuring them great, and a disposition to employ them rapidly extending. We saw near the boatable waters great quantities of lime, marl, green sand, oyster shells, ashes and manure, and in many places marl pits which had been extensively excavated, and were told that the use of all these fertilising materials was sensibly increasing.

The *Morus Multicaulis* is at present the staple

product of New Jersey, particularly about the cities and villages. On asking a grower near Burlington, what portion of the land in that vicinity was appropriated to the growth of this plant, he replied, between a third and a quarter. Many gentlemen have made fortunes by the sale of the trees and buds, and many, very many, expect to make fortunes in a like way, and some by feeding worms. We saw several extensive cocooneries, but principally at present appropriated to the production of eggs, which have borne a very high price. Lays have let for \$50 an acre, for raising the multicaulis.—There are considerable failures in the crop, owing to the unfavorable spring, the plants having generally been grown from single buds. Actual sales have been made at 15, 20, and 25 cents. We heard of none being sold higher. The plants are from one to five feet high. In Virginia and Maryland, sales are said to have been made at 34, 50 and 100 cents. We saw at Hightstown, many of the multicaulis grafted, at the ground, upon the white mulberry. Their growth had been surprising. We measured some on the grounds of Mr Coward, which had grown, during the season 8 feet 4 inches.

Lime is principally brought from Pennsylvania, sold at 10 and 12 cents per bushel, slaked. It is applied, in rather an effete state, at the rate of 50 to 100 bushels an acre, the poorer land receiving the smaller, and the richer land the larger dressing. It is generally mixed with arable lands by the harrow. Its benefits are palpable; and the increase of the first crop often pays the outlay.

Marl, which includes green sand as well as shell marl, abounds in Monmouth county. That procured from the southern border of the county is deemed best. The expense of dressing an acre at Shrewsbury, with a charge of twelve miles of land carriage, is from 15 to \$30. Inferior qualities are procured there cheaper, though a greater dressing of these is required. It amply repays charges in the first crops, and permanently improves the land.

Among other fertilising materials, we saw barilla ashes, and the fleshings, hair and tan from morocco factories, and great quantities of sea-weed, collected on the beach, and afterwards spread in the hog and cattle yards. Sea weed forms an important item of manure on the seaboard. We should be pleased to receive a communication from some gentleman familiar with the subject, as to the best mode of preparing it and applying it to the soil. Peaches are a profitable article of culture in the country through which we travelled. The fruit is convertible into money in twenty-four hours after it is gathered. The profits would be far greater if means could be adopted to prevent the early decay of the trees. The average continuance of a peach orchard is from six to eight years; and four crops of fruit are considered a liberal return. The disease which destroys the trees is termed the *yellow*. Would it not be commendable in the New Jersey State Agricultural Society, which has just been organized, or even in the legislature of that State, to offer a bounty for the discovery of a cure or preventive of this disease? It is preferred by the peach growers to leave the trees without pruning,

even in the nursery, that the branches may spread naturally. A Delaware peach grower practises cutting in the branches, after they have borne two crops, and thereby gets newer and better bearing wood. By planting thick, and heading in a portion every year, alternately, the fruit is very much improved, without being sensibly diminished.

The extent of the peach plantations will seem extravagant to some of our northern readers. Many groves here 10,000 trees, one 30,000; and at one place in Shrewsbury, there are 50,000 trees growing contiguous and forming as it were one magnificent orchard.

Melons also constitute one of the staple products of some parts of New Jersey. Staple loads are daily taken to the New York and Philadelphia markets, and sold at ten and twelve dollars a hundred. Some idea of the profits of the melon culture may be formed from data which we obtained at Keyport.

P. Hopkins bought twelve acres of land, in 1837, in Middletown, for which he paid \$30 per acre. In 1838, he put four acres in melons; his crop averaged \$150 per acre. He put the same in rye in the autumn, and in 1839, got 30 bushels the acre. And in the present year he put six other acres in melons, the average value of which is estimated at \$150 to \$200 per acre. The expense of hire, manure and fish was \$32, and of labor \$10 per acre. The account for the two years would therefore stand as below.

Cost of 12 acres of land, at \$30	\$360
Cost of manure and labor on 10 acres, at \$12	120
Total outlay	\$780
Receipts from melons, 4 ac. \$150 per ac. in 1837,	\$600
do do 6 do 1838,	900
do from rye, 4 acres, 120 bushels,	120
	\$1,620
Deduct cost of land and charges	600
Nett profits in two years,	\$1,020
and the land in the bargain.	

Green Crop of Indian Corn.—N. Shotwell, of Rahway, has made an experiment with corn as a green crop, which proved highly advantageous, and which, if we mistake not, affords a valuable suggestion to the farmer; as there is probably no green crop which will impart so much fertility to the soil as Indian corn. Mr Shotwell sowed four acres with corn, broadcast, four bushels to the acre, at the usual planting time. When the corn was about breast high, he ploughed it under, affixing a chain to the whiffletrees, to break down the stalks; at the usual time he sowed timothy seed, and obtained a greater crop of grass than he ever got after clover, buckwheat, or other green crops.

New mode of preserving apples.—We were presented by our host at Trenton, Aug. 10, with a pipin of last year's growth, as crisp, juicy, and of as fine flavor as those we have eaten at midwinter; and on inquiry were told that they had been kept in a tight cask in an icehouse.

With regard to the state of society in New Jersey, we are disposed, from the observation we were able to make, to think highly favorable of it. A greater equality seems to exist among the inhabitants, and more good feeling and kind-heartedness towards each other, than is commonly witnessed. All seem to be well off to live; and there are few of those artificial or aristocratic distinctions which are the bane of social and friendly intercourse; and inimical to republican habits and institutions.

REV. MR. COLMAN.—Dear Sir—I enclose to you the essay of an amateur farmer who takes great delight in tracing the links of cause and effect, where they can be discovered, and in seeking for those which are as yet beyond our reach. If you think favorably of it, please use it as it was intended: if not, I should like to have it returned to me.

Yours, truly, N. C. KEEP.

[We are very happy to give the unjoined communication to the readers of the Farmer. It will be justly appreciated. It shows an observing and inquisitive mind. We are not prepared now to enter into the discussion, because it has been made matter of particular injunction by the government, to prosecute the inquiries which are here presented, and we do not therefore wish to anticipate our report. But there is much reason in what is here stated, and we shall deem it a favor to hear at any time from our intelligent correspondent.—H. C.]

For the New England Farmer.

"The surplus crop of wheat in west New York was one and a quarter million bushels less in 1838 than it was in 1835. Whence this great diminution of product? Not from there having been less sown in 1837 than there was in 1834, for it is believed that the quantity sown in 1837 was at least one-tenth if not one-fifth greater than in 1834. The deficiency was not owing to bad culture, for the culture it is believed has been gradually improving; nor to a bad season, that of 1838 being at least equal to those of ordinary occurrence."—*Albany Cultivator*.

We might add to the above quotation that nearly the whole of New England was once a wheat-growing district, and that now it is rare to find a field of wheat on the Atlantic border. How is this change to be accounted for? I answer, first, in the good old way, *negatively*. It is not because we do not manure our lands. The contents of the dung heap and the barn yard are dispensed with a more liberal hand than they were in the days of our ancestors. Second: it is not owing to a change of climate: for on some of our soils in New England, wheat is still raised without difficulty. To what then is this general failure of the wheat crop in New England and its great diminution in New York to be attributed? In my opinion chiefly to this—the vegetable matter of the soil has been exhausted, or so much reduced as to be unable to bear a good crop of wheat. Let us look at the facts which may be brought forward in confirmation of this opinion.

First—an abundant crop of the finest wheat can still be obtained on new lands. Here are the vegetable deposits of ages—the very food which, according to our supposition, the wheat demands. It is true that interval lands are sometimes found so exceedingly rich in vegetable deposits that they will not bear wheat until after several years cultivation: the reason probably is, there is not enough silicium reach of the wheat roots to form the straw, and though the growth is luxuriant, the straw is unable to sustain its weight, and lodges as the farmers term it.

Second—a liberal supply of ashes sown upon the growing wheat will sometimes bring up a good crop. The office which the ashes perform in this case, I apprehend to be this: they render what vegetable matter there is in the soil soluble, so that it may all be appropriated by the growing crop.

Third—it has been ascertained by experiments which have been lately instituted in France, that certain saline manures which have a wonderful energy in increasing the foliage of plants, have no tendency whatever to increase or perfect the seed. Now these saline substances are constituent parts of our animal manures. No wonder then, if when our barns are filled with sheaves we find but little grain.

Fourth—on the intervals of Connecticut river the best crops of rye are those which grow on the decomposing sod of turf. We plough grassland in the spring—plant it with corn—in the fall we plough it again and sow rye; a large crop is almost sure to follow such a course.

Fifth—a crop of wheat has sometimes been secured by very deep ploughing. Might not this case be explained by supposing that while the vegetable matter in the surface was exhausted, there still remained enough in the subsoil to carry up a crop?

These are some of the reasons which have wrought in my own mind a strong impression that the failure of our wheat crops in New England and their alarming diminution in New York, is to be attributed to a *deficiency of vegetable matter in the soil*. If this impression is well founded, may we not infer also that for the perfection of other seed-bearing crops, more vegetable matter must be added to the soil. Where shall it be obtained? I answer, from the peat bogs; or if this is impracticable, let resort be had to that exhaustless store-house from which the vast deposits of peat have themselves been drawn. Any one who knows that peat is formed solely from air and water, and that it has accumulated in some places to the depth of sixty feet, will readily understand why such extraordinary fertility should be imparted to the soil by turning into it successive crops of clover or other vegetable products of large growth and abundant foliage, formed also mostly from air and water.

Let no hasty reader of the preceding remarks infer that vegetable matter is the *only* requisite for the successful culture of wheat and other grain crops. We must have *sunshine* and *rain*—we must have the *earths*—we must have *alkalies* or alkaline earths to prepare the vegetable food, so far as it may be wanted, to enter itself into the substance of the plant.

J. R. K.
Longwood, 1st Sept., 1839.

[For the New England Farmer.]

—
Dehdam, Sept. 17, 1839.

DEAR SIR—Though I have not the pleasure of knowing you personally, I take the liberty of requesting the benefit of your advice as to the best mode of planting forest trees, such as acorns, chestnuts, walnuts and ash seeds—all of which I planted two successive years in the month of November, and covered very lightly with earth, sometimes only with grass or leaves; yet with all my pains, not one seed in fifty has come up—these have grown very slowly: none of the walnuts, though three years old, are six inches high: the ashes and the rest are no better. They were planted in grass land, of which some is dry and solid, the rest meadow—all favorable to the growth of wood, a large forest having grown there in times back, and there are a great many thrifty young trees of a natural growth there still in the north end of the field.

I propose to plant again this season. What is the proper time? Should the seeds be buried or

left on the surface? Please answer when convenient. Maple trees used to grow on the land—what is the best way to plant the seeds?

Yours, truly,

WILLIAM AMES.

Mr JOSEPH BRECK.

Boston, Sept. 18th, 1839.

REV. MORRILL ALLEN—Dear Sir—As you have had some experience in planting forest seeds, will you be so good as to answer the above queries, as I have never had any experience myself in this line; by so doing you will not only much oblige me, but a number of correspondents who have desired information on the subject.

Respectfully, yours,

JOSEPH BRECK.

MR BRECK—Dear Sir—It is not in my power to give very definite answers to all the inquiries of your correspondent, Mr Ames. I have had no experience in planting chestnut, walnut, ash, or maple seed. Very little of the soil in this section of country is favorable to the growth of chestnut or walnut trees; ash and maple will flourish very well in some situations, but require better soil than we are at present disposed to convert into forests. Acorns have been planted by me to considerable extent and always with less success than was anticipated. A large portion of them have either perished in the soil or been devoured by vermin;—probably been devoured, for it has always been noticed that the greatest number vegetated in land that had been recently stirred by the plough, where there was neither grass nor any sort of rubbish to furnish the field mice with materials for building habitations. According to my experience it is a correct method of planting to cover the acorns lightly with soil; covered with only grass or leaves they may vegetate, but the plants will not take so firm hold of the soil.

The growth of oak from the acorn is at first extremely slow. Whoever undertakes thus to rear a forest must "exercise long patience" and labor, as all philanthropists do, for the benefit of those who will live after him.

Young trees from acorns are apt to be shrubby and ill shaped: none of mine appear as if they would ever grow to slightly and valuable trees.—Some of them have been planted five years, and do not exceed fifteen inches in height. My present purpose is to cut them down about the first of next May even with the ground. I would not in very positive terms recommend this course to any other person. The effect may be different from what is anticipated; but from observations on the origin and progress of shoots in the forest, my expectation is, that from each of the stumps a sprout will immediately spring; that it will grow more rapidly and in more regular form than the seedling shoot. This purpose is here disclosed in the hope that others will make experiments, for it seems to me if oak trees cannot be advanced to maturity sooner than seedling shoots will naturally grow to trees, that the planting of acorns can benefit only those who may live in a future century. It is, however, proper to remark in this connexion, that the land planted by me with acorns has always been of poor quality.—Seedling shoots might grow much better in stronger soils. My object has been to reduce to forests plats of land which produced little herbage, and which were considered too much exhausted for

profitable cultivation. On such land some acorns have been planted, but the chief dependence for an early growth of wood is on white birch and pine.—Birch will come to full maturity from the seed in about twenty years; and white or yellow pine will do to cut in thirty years from the planting.

The best time for planting any kind of forest trees I suppose is at the season when the seed is matured and naturally falls on the earth, in the months of October and November. Some writers recommend the spring as preferable, but it is proposed no other advantage can attend spring planting than something of greater security against the devouring jaws of vermin.

After several unsuccessful trials in planting on sward land, I have ceased repeating them, and the land where it is intended to sow forest seed is ploughed in June or July, winter rye is sown in August, and then forest seeds planted in the rye during the autumnal months as the seeds ripen.—Pine and birch seed are often sowed broadcast on the surface, but a light covering no doubt would be better.

Respectfully, &c.

MORRILL ALLEN.

Penbrooke, Sept. 23d, 1839.

For the N. E. Farmer.

MR EDITOR—I have had the pleasure of reading your paper as a subscriber for six years; but while I admit I have received great benefit from its perusal, I have not cast in my mite for the benefit of others. The reasons are these: I am one of those illiterate farmers not capable of doing common business in life, and much less for putting any thing on paper for others to read. When at the age to have acquired a good academical education I was not permitted the privilege. When I consulted my father upon going to school, "O," said he, "you are going to be a farmer, and learning will do you no good. I never ciphered farther than interest: I could read and write: this has answered my purpose, and it will yours." I say this with respect for my father, (who is not living,) for it was then characteristic of the age.

I have, sir, read a number of pieces in your paper headed "The Education of Farmers": I always read them with deep emotion of feeling, believing that where we farmers lack the most in is, the want of education: in my humble opinion then, just as fast as farmers increase in knowledge, so fast will increase the improvements in agriculture. Now, sir, how shall this be done? I answer, through reading, reasoning and observation. I do not believe, sir, there is any occupation which offers so large a field for the mind to work in as that of agriculture. I heartily rejoice in the belief that this once neglected occupation is fast rising in the estimation of the community. The honorable title of a 'country bushwhacker and ploughjogger,' is fast gaining ground. In the town in which I reside, if I mistake not, six years ago no more than three or four agricultural papers were taken; now I think I can safely say there are between thirty and forty. I take two myself, and have them ready on the table, so that when I come in to stay ten or fifteen minutes, I catch them up and read—and I believe it does me more good than a glass of bitters did in old fashioned times)—and while my body is resting I am feeding the mind. I am a young farmer: I glory in the title: I have just commenced my A B C in agriculture, and if a young man would wish to

acquire knowledge, he must come to the conclusion that he does not know any thing; then he will place himself in a situation to learn; but if he thinks he has arrived at the top of the hill of science and can learn no more, he must assuredly never will.

On the farm which I live a few years ago there was kept on it but five cows, one yoke of oxen, and one horse—cut 15 tons of English hay and made from 50 to 75 loads of manure a year. Now it will keep well 25 cows, 6 oxen, 2 horses, summer and winter. I cut 60 tons of English hay, and make 400 loads of manure a year: and if I and my family live by the blessing of divine providence, I will not stop till I have doubled the present amount: at any rate, I will try. I acknowledge I have received great benefit from reading agricultural papers and books; but a man must also bring into action his own reason. The kind of grain or quantity which will suit one piece of land will not another, and so it is with grass seed requiring double the amount on some land that it does on other land.—And now, sir, when I read in your paper or any other agricultural paper, the scientific and practical results of old and experienced farmers, I treasure it up and make all the improvement upon it, I can. More anon. P. F.

Southboro', Sept. 18, 1839.

[REMARKS.—We like the spirit of our correspondent much, and are heartily glad to learn that he is beginning to feel it his duty to give as well as receive. We think he does himself injustice, however, in classing himself with those "not capable of doing common business." We do not like to hear our noble hearted farmers express themselves thus. What! increase the products of his farm four fold and means to "try to double" that amount, and not capable of doing common business! Impossible! it is not so, nor shall it be. Whatever may have been his disadvantages in early youth in obtaining an education, (and we have no doubt they were great, in common with a large majority of our farmers, and we will class ourselves with them,) it is pretty certain he will not long remain at the bottom of the hill, even if he places himself there.—The expression "I will try," has, and will do wonders. He has tried and given us a communication. Try again and give us some account of your farm, your manner of operation, your success, your failures, &c.; and we have no doubt but the effects of your trying will stimulate others to try, and then we shall have a pleasant interchange of feelings, sympathies and opinions, as there should be among farmers, through the press, as well as in a neighborhood. Do not stop then, but try, try again.

J. B.]

[For the New England Farmer.]

Plymouth, Sept. 23d, 1839.

MR EDITOR—Dear Sir—I observed in the Farmer of the 18th inst. an account of some singular aberrations in vegetable physiology, instanced in the peach tree. In your remarks in reference to the apple tree you say, "this of course is a stumbling to our faith, but still we cannot give up the idea that without artificial means the thing is impossible." My object in this address, Mr Editor, is to produce another stumbling to your faith, but at the same time you must excuse me if I add, when undeniable facts are presented, however unsusceptible of illustration, we should not be faithless but believing, for the improvement of science.

"Nature in her teaching speaks in very intelligible language, and that language is conveyed by experience and observation."

In the year 1825, I published a little work entitled "The American Orchardist," &c. &c., from which I now extract as follows—page 33:

An account of a singular apple tree, producing fruit of opposite qualities—a part of the same apple being frequently sour and the other sweet; in a letter from the Rev. Peter Whitney, published in the Memoirs of the American Academy of Arts and Sciences—vol. 1st.

"There is now growing, in an orchard lately belonging to my honored father, the Rev. Aaron Whitney, of Petersham, deceased, an apple tree very singular with respect to its fruit. The apples are fair, and when fully ripe, of a yellow color, but evidently of different tastes—sour and sweet. The part which is sour is not very tart, nor the other very sweet. Two apples growing side by side on the same limb, will be often of these different tastes—the one all sour and the other all sweet. And, which is more remarkable, the same apple will frequently be sour one side, end, or part, and the other sweet, and that not in any order or uniformity; nor is there any difference in the appearance of one part from the other. And as to the quantity, some have more of the acid and less of the sweet, and so vice versa. Neither are the apples, so different in their tastes, peculiar to any particular branches, but are found promiscuously on every branch of the tree. The tree stands almost in the middle of a large orchard, in a rich and strong soil, and was transplanted there forty years ago. There is no appearance of the trunk or any of the branches having been engrafted or inoculated. It was a number of years after it had borne fruit before these different tastes were noticed; but since they were first discovered, which is about twenty years, there has been constantly the same variety in the apples.

For the truth of what I have asserted, I can appeal to many persons of distinction and of nice tastes, who have travelled a great distance to view the tree and taste the fruit; but to investigate the cause of an effect so much out of the common course of nature, must, I think, be attended with difficulty. The only solution that I can conceive is, that the *ovules* or hearts of two seeds, the one from a sour, the other from a sweet apple, might so incorporate in the ground as to produce but one plant; or that *farina* from blossoms of those opposite qualities, might pass into and impregnate the same seed. If you should think the account I have given you of this singular apple tree will be acceptable to the American Academy, please to communicate it. I am, &c.

PETER WHITNEY."

I will embrace this opportunity to communicate for the benefit of the bee cultivator, what I believe to be an infallible remedy against the bee moth, which has proved so destructive to bees throughout our country of late years. The remedy is simple and easily applied. It consists merely in covering the floor board on which the hive stands, with common earth about one inch thick. A hive set on earth will never be infested with worms, for the bee moth will not deposit her eggs where the earth will come in contact. She naturally resorts to a dry board as her element. This remedy has been employed by a number of persons in this vicinity for several years with complete success.

With my best wishes for the continued success

of your valuable efforts in the great cause of agriculture, I subscribe myself with respect,

Your obt^d serv^t,

JAMES THACHER.

For the New England Farmer.

MULBERRY TREES.

MR COLMAN—Sir—My attention was attracted a few days since, in looking over an old almanac, (of the year 1772) to an article with this caption—"Memoirs of the Culture of Silk," giving some items of its progress in Europe within the last century, as follows: "One thousand mulberry trees in Italy are worth £100 sterling per annum"; and also, "One million mulberry trees in the Provinces will enable a yearly remittance to Great Britain of a million sterling per annum."

Without any *vanus præjudice*, I am inclined to the opinion, that the culture of silk at the present time in this country, is more *flattering* than it was in Europe at the period referred to above.

Yours,

NON DEFENDENS.

Sept., 1839.

To the Editor of the Farmer's Cabinet.

Sir—The handsome manner in which you noticed my first communication, emboldens me again to address you on a subject which is, I conceive, peculiarly within my province, I mean

THE MANAGEMENT OF THE DAIRY.

I have heard that in many of the English dairies the use of large leaden pans, for the reception of the milk for creaming, has been introduced, very much to the convenience of those engaged in that branch of husbandry; and the present communication is, to enquire if any of your readers are sufficiently acquainted with the mode of management, and the structure of the pans, to be enabled to describe them, for the benefit of those immediately concerned.

I understand they are sometimes made large enough to contain the whole milking of the dairy; are dish-shaped, and set on a stout frame of wood, sufficiently high to admit a pail being placed under the centre of the bottom, by which the milk is drawn off by means of a tap, without disturbing the cream: so that, after the milk has passed off, the cream remains in the lead, to be removed in the most convenient and economical way imaginable. Now, to appearance, this is a most valuable improvement over the present tiresome and unsatisfactory process of skimming, and if two or three objections which at present strike me, can be removed, I think the introduction of these pans into general use, would be of all things most desirable.

In the first place, is it not to be expected that the lead, especially if the milk be left to become sour, as is often the case, would communicate to the milk a decidedly poisonous quality; and would not this property be increased in the hands of filthy and careless persons? In the next place, would there not be a danger that a portion of the cream would pass away with the milk through the tap, at the time of drawing off? and would it be easy to know at what point to stop, when all the milk and none of the cream had been drawn off? And again, would not the use of the lead pans deprive us of the opportunity of setting the milk contained in the receivers into streams of water in the spring-house, as is customary in very many cases, for the purpose of keeping the vessels cool in hot weather?

Now these are the difficulties which I present strike me. I only hope that some of your readers and numerous friends will be able entirely to remove them, and add such a list of advantages to be derived from their general introduction, as will not leave even the most careless and indifferent amongst us a single argument in favor of the present very inconvenient and tiresome method of skimming, which has always appeared to me about the most fatiguing part of my labors, to say nothing of the great loss of cream attending it in the hands of careless persons, and on the other hand, of injury to the butter, when a portion of the milk is removed with the cream, in the endeavor to skim close.

Bucks Co., Penn., Aug. 28, 1839.

P. S.—I have the pleasure to inform you my husband has done "*cooning*," and will henceforth devote all his energies to the raising sugar beet for the use of the dairy, and has calculated that we can keep three times the number of cows, and make six times the quantity of butter that we now do, on the same number of acres. A neighbor has thirty tons of those roots per acre this season; if his do the same, leads or some other contrivance will be necessary to contain the increased quantity of milk which will be obtained.

LIME.

A farmer who has been applying lime to his land for the last seven years, informs us that he has just finished hauling out his stable manure on to the field that he intends sowing with wheat, and that he has a surplus which he has applied to another field. He stated that his stable manure had increased to about double the quantity since he commenced using lime. He now grows much more grass, can keep more stock, and consequently enriches the soil more rapidly, and raises an increased quantity of grain. This farmer years back found it hard scuffling to get along with a large family and make both ends meet, and he then thought he could hardly afford to use lime. But experience has opened his eyes full wide, and he now thinks he could not well afford to omit the application of that grand panacea, lime, which has been the grand agent of his prosperity.

Those who have not made an experiment with lime, would do well to try it this autumn on their stubble fields that are intended to be mown next season, and if they do not find their interest essentially promoted by it, the result will differ from that of numerous farmers who have often adopted this plan of application with the greatest advantage.—*Farmer's Cabinet.*

Sales of Morus Multicaulis Trees.—The following sales of trees have been made within the last two weeks, viz: 20,000 in East Hartford, at 30 cts. a tree; 50,000 in Wethersfield, at 30 cents; 13,000 in Glastenbury, at 40 cents; 2,000 in Berlin, at 37 1-2 cents; and a gentleman in Farmington has paid 45 cents a tree for a lot.

We learn that about 300,000 trees have actually been sold this season in the vicinity of Hartford. Of these 70,000 have been sold to go to Pennsylvania, 50,000 to Michigan, 20,000 to New Jersey, 50,000 to Massachusetts, and 10,000 to New York.—*Conn. Courant.*

It is stated by Dr Jackson, in his last geological report, that twelve persons at the forks of the Kennebec river, manufactured 36,650 lbs. maple sugar. This, at 10 cents a pound, would be worth \$3,665.

From the Farmer's Cabinet.

A SOURCE OF COMFORT.

"It comes home to every man's business and bosom, sticking closer to him than a brother, and is an article which no good farmer should be without." "Ah," said his friend, "I see you mean a good wife!" "No," said the farmer, "I mean flannel next the skin!"—the next best thing to a good wife: that is an affair of the heart, and is not, we see, affected by any outward circumstances—but all things else, I conceive, are governed to a very great extent, by the general influence of flannel next the skin. It keeps up a state of insensible perspiration, without which, the doctors will tell you there can be no health, and without health, there can be but little happiness. In this remarkably changeable climate, with the thermometer making such plunges as almost to endanger the quicksilver tube, how necessary is it that an animal so exposed to its influence as man—exposure sufficient to kill a horse—should be protected by some means from the fearful consequences: and in flannel he has exactly that protection which he needs! In very hot weather, a very thin texture formed of this singular substance, adds very little to the heat, but forms an impenetrable shield against the cold chills which are often experienced, even at the moment we are complaining of the hot blasts which are raging round us; while in the severest cold of winter, when a man would not turn a dog out of doors, as the saying is, he walks forth under about a dozen folds of this blessing, in the form of undershirt, waistcoat, defensibles, under-coat, upper-coat, cap and overalls, grinning at the north wind, and defying the tempest!

It is a most remarkable property of flannel, that although it prevents the ingress of cold, it seems, in a measure, to facilitate the egress of heat, and is on this account admirably calculated to form the clothing of that animal on whom alone it might be said to be found, and which, without this wise ordination of "Him who doeth all things well," would be totally unable to move or exist in hot weather under a covering from four to nine inches thick, of a substance which, of the texture even of gauze, will enable a man to defy the elements! It is truly a wonderful ordination of nature, which ought to call forth, every day of our lives, the sacrifice of a grateful heart! but the blessings of life, coming in the humble guise of a flannel shirt, are very apt to be overlooked—so true is it, that our greatest blessings are of every day occurrence, and so common, that, like the air we breathe, we might be said to expire them—too often with careless and unthankful hearts."

This spoke my friend, an adjoining farmer,—need I add, he is the best husband, father, friend and manager in the neighborhood! J. A. C. Kingston, Ulster co., N. Y., Aug. 29, 1839.

Remittances by Mail.—"A Postmaster may enclose money in a letter to the Publisher of a Newspaper, to pay the subscription of a third person, and frank the letter, if written by himself."—AMOS KENDALL.

Some of our subscribers may not be aware that they may save the postage on subscription money, by requesting the Postmaster where they reside to frank their letters containing such money, he being able to satisfy himself before a letter is sealed, that it contains nothing but what refers to the subscription.—Maine Farmer.

THOUGHTS ON FARMING.

I have based the following estimates on the supposition that each acre of best parts of our soil should be made to produce at least half its greatest or maximum product; that whether we cultivate more or less, it is the truest economy to cultivate it well. What the maximum product of particular spots in a particular town or village may be, I do not, of course, undertake to determine; but the real maximum product, so far as I know, in Europe or America, is 150 bushels of corn, and 1000 bushels potatoes to the acre. I have supposed, I say, that each arable acre of New England soil ought to be made to produce at least half its maximum product; and that each tenth acre of land among us ought to be cultivated with these. Each tenth acre, therefore, among us, ought to be made to produce 75 bushels of corn or 500 bushels of potatoes. This being premised, I make the following references and conclusions.

If one-tenth of each square mile in this country were cultivated as it ought to be with corn or potatoes, the produce—admitting the remaining nine-tenths to be sufficient for pasturage and other purposes—would sustain an immense population.

One-tenth of a square mile is 16 acres. Now the produce of half of this in corn and half in potatoes at the rate per acre I have assumed above, would be 1600 bushels of corn and 16,000 bushels of potatoes. Now ten bushels of corn or forty of potatoes, properly cooked, is an abundant supply of food for an individual, upon the average, for a single year. Yet at this rate each square mile should sustain a population of 560 souls, and the whole State of Massachusetts estimated as it is to contain 4,644,000 acres of land, a population of 4,063,360. And if the United States contain within their territorial limits 2,000,000 square miles of land—and they probably do more than this—one-tenth of it ought to be made to sustain 1,200,000,000 inhabitants, or a population much greater than that of the whole world at the present time. Not even China or Hindostan taking the whole country together, sustain a population one-fourth as great.—*Dedham Patriot*.

A Bottomless Meadow.—As the line of the Glasgow and Ayrshire railway crosses from Ayrshire in Renfrewshire, there is a meadow about three miles long, belonging to Mr W. Patrick, through which it has to pass, and where it has to be embanked four or five feet high. The contractors lately entered upon it and commenced the embankment, but were not a little surprised to find that their labors, like those of Tantalus, threatened to be of an endless nature; as having embanked 30 yards, they found that about 19 had sunk or subsided below the level of the line. They next day repeated their work, re-forming the embankment to the ordinary level; but strange to say, the undersoil again gave way, and although they have since continued day and night to heap earth upon the spot, the greedy bowels of the meadow receive it as it is applied, and the workmen are, not without reason, despairing of finding a solid foundation. This most singular phenomenon attracted a large party of engineers to the spot on Saturday week, who could account for it in no other way than that the meadow is floating on water; which supposition seems the more feasible, that the ground rises on each side of the sinking portion, and splits into deep cracks or bogs. The people of the district have flocked in hundreds to take ocular demonstration of the fact.—*Scotch paper*.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Sept. 21, 1839.

The display of fruit this morning was very good, and it was contributed as follows:

From R. Manning, Esq., Salem: Croft Castle and Sharp's Emperor Pears. Also, Red Magnum Bonum (London Hort. Soc. Catalogue), and St. Catharine Plums.

From Wm. Oliver, Esq., Dorchester: Bartlett or William's Bon Chretien and St. Glaislain's Pear, and beautiful specimens of President Peach.

From Otis Johnson, Esq., Lynn: Zinfendal Grapes, (superior specimens,) and Bourre Romain Pear.

Superb specimens of Seedling Peaches were presented by Col. M. P. Wilder, from the garden of Edward Sharp, Esq., Dorchester.

Mrs Bigelow, of Medford, presented three baskets of Peaches, equal to any that have been exhibited this season: they were Bigelow's Rareriepe! Melacaton, and a natural peach.

From James L. F. Warren, of Brighton, two varieties of Seedling Peaches; also, Royal Kensington and George IV. Peaches: William's Bon Chretien and Washington Peaches,

Mr Thomas Mason, East Boston, exhibited Black Hamburg Grapes and Bromfield Nectarines.

From N. Webster, Esq., Haverhill, two varieties of Plums.

Very fine Peaches were exhibited by Mr C. Goldermann, of Chelsea.

Mr J. A. Kenrick, of Newton, exhibited Cutter's Rareriepe Peaches.

Seedling Peaches were presented by Mr Joseph W. Newell.

John C. Lee, Esq., of Salem, exhibited specimens of the Buffum Pear?

Extra fine Peaches were exhibited by Mr James Hill, jr.

Mr John Dunklee, of Brighton, exhibited a basket of very beautiful Peaches, called the Pine Apple? presumed to be the old Yellow Rareriepe: they weighed seven ounces each.

Mr Park, of Roxbury, exhibited Bartlett or William's Bon Chretien Pears.

J. G. Coolidge, Esq., of Cambridge, exhibited two baskets fine Yellow Rareriepe Peaches.

For the Committee,

JAMES L. L. F. WARREN.

EXHIBITION OF VEGETABLES.

Saturday, Sept. 28, 1839.

Hon. John Lowell, Roxbury, exhibited Rohan Potatoes of very superior size and form.

For the Vegetable Committee,

J. L. L. F. WARREN, Ch'mn.

Fiftythree bushels of wheat to the acre.—Edmund Richmond, of Euclid, near Cleveland, Ohio, raised this season from two acres of land, one hundred and seven bushels of excellent wheat. The soil is clay, and is known by farmers as beech clay, a kind of soil that heretofore has been thought not very good for wheat. So much for proper cultivation.

In East Tennessee wheat is 37 1-2 cents per bushel, and farmers a short time since, were contracting to sell corn after harvest, at 12 to 18 cents per bushel.—*Bost. Times*.

BOSTON, WEDNESDAY, OCTOBER 2, 1853.

ESSEX AGRICULTURAL SHOW.

The Essex Agricultural Society held their annual Cattle Show on Thursday, 20th inst. at Georgetown, (formerly New Rowley.) The attendance was very large, and the arrangements were made and executed in a satisfactory manner, saving only that the dinner hall was not large enough to receive more than two-thirds of those who would have been glad to have obtained admission.

There was a well drawn ploughing match, contested with much spirit and skill. Four teams of one yoke of oxen each, two teams of a pair of horses each, eight teams of two yoke of oxen each, entered the field. The ploughs used on the occasion were, first Moore's plough, from Barret, Vt., sent by Henry Stevens, Esq., of that place, for trial; Winstlow's plough, made in Middleton, Essex co., which was a wooden plough, and well constructed; Brickett's plough, which was also a wooden plough, and much esteemed by those who have been accustomed to its use; several ploughs made by Ruggles & Nourse, of Worcester; one of Howard's ploughs, and one from Prouty & Mears' establishment; the character of these ploughs is well established. With some exceptions, the ploughing was well executed, and some of it could hardly be improved.

We understood that the several committees were to make up a judgment of the comparative excellence or character of the different ploughs used. This was not done, we believe, but perhaps we may have it hereafter in the full report. We shall not obtrude our own judgment, lest it should seem invidious. Great advances have been made in the construction of this most important instrument within a few years. The introduction of the improved cast iron mould board may be considered almost as marking a new era in agriculture. Yet it can hardly be supposed that we have as yet attained to perfection in the construction of this valuable implement. What has been accomplished will, we hope, stimulate to new exertions. Whatever remains to be done, however, in the construction of the particular form of the tool, it must be admitted that the workmanship of many of the ploughs and agricultural instruments now on exhibition at the Mechanics' Fair in Quincy Hall, Boston, discover a skill and perfection of finish most admirable and seldom equaled.

Two things are requisite to all agricultural instruments and in all other machines designed to assist and facilitate labor; the first is that the implement or machine should do the work which it is intended to accomplish, well; and next that it should do it with the least expense of labor that is practicable. That a plough should have these excellencies, particular attention is required to the centre of traction, and to the line of traction, and to the form of a mould-board, which while it shall lay the inverted sod at the desired angle, shall, at the same time raise the sod and slide forward with the least amount of friction possible. These are matters of scientific and exact mathematical calculation; and that we have still something to learn in this case will appear to a practised eye, from comparing some of the most approved ploughs among us with a plough used on this occasion from Barret, in Vermont, and made, in a measure, after the model of Small's Scotch plough. There are, however, defects or mistakes in the form of this Vermont plough, especially in the construction of the

beam. These might easily be remedied. The mould-board is excellent in its form.

The show of cattle at Georgetown was respectable.—The working cattle were very good. There were several excellent milk cows, one of which was stated to have made fourteen pounds of butter per week for a length of time. There were some good young cattle.—The entries of swine amounted to seventeen, embracing boars, sows and pigs, and fat hogs. Two fat hogs belonging to Perley Tapley, of Danvers, weighed over fifteen hundred pounds live weight. There were several different races of swine, but the Berkshire seemed to carry the day, for their neatness, compactness and thrift, though other breeds there showed much larger size.—The Berkshire of all others must be considered the poor man's or the small farmer's hog, as coming earliest to maturity and giving the greatest amount of pork for the expense incurred. We have never seen at any of the Cattle Shows in Essex, so fine an exhibition of swine. Several hogs were entered for premium and some of them of much merit and beauty. The bulls had little to recommend them. There was some very good young stock from the Moody farm, in West Newbury. The show of articles of domestic manufacture or household industry, was very honorable to the ladies, who contributed liberally to this part of the exhibition. Several premiums were awarded to children under twelve years of age—one premium for needle work, to a little girl only five years old; and the best grass bonnet presented was from the hands of a lady of eighty-five years old. If we suppose the young competitor of five years to go on in her successful and skillful industry until she reaches the venerable period attained by the last lady, she will certainly have accomplished her share of the work of this world, and have given an admirable and useful example.

There were several specimens of dairy produce presented. Of the cheese we cannot speak, other than that its appearance was good. Some samples of the butter, and particularly from Mr Howe, of Methuen, and another lot, the name of the maker of which we do not remember, showed much neatness and care in the management and manufacture; but most that was exhibited was quite inferior, certainly as matter of exhibition.—Much of it was salted to excess; and much of it had a waxy, daubed appearance, which showed that it was badly worked. There are few things in which we more need improvement than in the quality of our butter. We know more than one farmer in the vicinity of Boston, whose butter, all that he can make, commands always thirty-seven and a half cents per pound. We have seen butter sold within the last few months in Boston market, by the quantity, for thirty-three, thirty-seven, forty-four, fifty, and even sixty cents a pound. One would think, therefore, that there is no want of encouragement to pains-taking in the manufacture of this necessary article.

We understood that the drawing match was well contested, but we did not see it. The truth is, that a single day for such an occasion, gives one hardly an opportunity of seeing any thing. Every thing must be done in a hurry; and many things must necessarily be passed over with scarcely a glance.

There was some valuable fruit and several beautiful bouquets of flowers presented by that excellent florist and liberal contributor, Mr J. M. Ives, of Salem, and others; and many rich products of the vegetable kingdom, in the form of Rohan potatoes, squashes, sugar beets, carrots, &c. From ten lbs. of the seed of the Rohan potato, Dr Robinson, of West Newbury, produced fourteen and a half bushels weighing 65 lbs. per bushel, equal to 942 1-2 lbs., which is nearly one hundred for

one. Mr W. Thurlow showed six squashes from one seed, weighing 199 1-2 lbs.; and Mr Samuel Balch offered five squashes from one seed obtained at the Cape de Verd islands, whose joint weight was 275 lbs.

Mr Wm. Osborn, of Lynn, a spirited and successful cultivator, exhibited a sample of Dutton corn, of beautiful appearance; and of China Tree corn, which was very handsome and promises to be a valuable variety. This China Tree corn does not ear upon the end of the stalk, nor produce so many ears upon a stalk, nor ripen so early as we were led to suppose from the advertisement given to the public; but from many specimens seen in a state of perfect maturity, we believe it will be well worth cultivating and saved from the condemnation with which a month since it was threatened from all quarters. We are strongly of opinion, however, that the actual difference between what it proves to be and what Mr Thurlow represented it to be, requires for his own sake, some explanation. Such explanation, if he will give it, we shall be happy to lay before the public.

A numerous company sat down to dinner, and after dinner the President of the day, Mr Duncan, called up Mr Saltonstall, the representative from the south congressional district, who addressed the company in a most agreeable manner.

The company then proceeded to the meeting house, where an instructive and excellent address was delivered by the Rev. Allen Putnam, of Danvers, now a practical farmer. After this, the reports of the several committees were read and the premiums announced, of which we shall give a list as soon as received.

Mr Putnam stated on his own knowledge, a very curious and instructive fact in the management of the dairy; which was, that from the same dairy, the same number of cows, and the same cows, fed in the same pasture, and in the same way, and in the same season, three different dairy women made in equal periods of time and under other circumstances as nearly alike as possible; one 17, one 23, and one 27 pounds of butter per week. So much for a difference in skill and care. H. C.

"THE GOOD HOUSEKEEPER, or the way to live well and to be well while we live." By Mrs. S. J. Hale. Weeks, Jordan & Co.: 12mo. pp.

This is a good book, and to be commended to those who are, and to those who purpose to become good housewives. It abounds with sensible advice and useful receipts. We agree in the main in the notions of the author respecting animal food. Man is omnivorous, and the great cause of disease is excess, rather than kind of food. We thank her for her protest against raw meats, or half cooked meats, and gravies which differ little from pure blood. They should be banished from civilized life, or the cannibals who eat them should be banished. We are sorry that she has not borne a loud testimony against bread so mixed up with salarata that it has a soft-sonny taste, and feel and smell absolutely detestable; but with such bread the country is almost every where surfeited. We commend her for her advocacy of the Irish. Few people have ever been more grossly abused. Their introduction among us has been of the highest advantage to the country. They have all the elements of a good and useful character; and it will be through our own fault and injustice and inhumanity towards them, if they do not prove as valuable and useful citizens as we can possess.

This book is an unpretending but a substantial contribution to good economy and domestic comfort.

H. C.

In consequence of the Muster which takes place in this city to-day, some of our subscribers will not receive the Farmer as early as usual.

["Our venerable friend, Dr Thacher, has given us another 'stumbler' relative to the singular freaks of nature, in the account of the apple tree, producing fruit of opposite qualities, which no doubt will be interesting to our readers. We have seen and tasted an apple from this very tree alluded to: we should be glad, however, to have another taste, as that was a number of years since, and not very satisfactory, requiring some fancy to distinguish between the sweet and the sour: it was not probably a good specimen, as we were assured at the time that the tree was known to many as producing fruit as described in the description published to-day.

J. B.

["We acknowledge the receipt of a basket of fine native grapes, from our friend, E. Phinney, Esq., of Lexington. The flavor of them was fine—the color a light claret—bunches very compact. This is the same variety we saw growing in such profusion on his stone walls a few weeks since, and noticed in the Farmer. J. B.

["We feel ourselves under great obligations to the Rev. Morrill Allen, for his answers to the queries of Mr Ames.

["A notice of the Annual Exhibition of the Horticultural Society will be given in our next.

BRIGHTON MARKET.—MONDAY, Sept. 30, 1839.

Reported for the New England Farmer.

At Market, 700 Beef Cattle, 520 Stores, 3300 Sheep and 2730 Swine.

Prices.—*Beef Cattle*.—We quote to correspond with last week, viz. First quality, \$7 25 a \$7 75. Second quality, \$6 50 a \$7 00. Third quality, \$5 50 a \$6 00.

Stores.—Yearlings \$12 a \$16. Two Year Old \$15 \$28.

Cows and Calves.—Sales \$32, \$37, \$16, \$48, \$50, and \$58.

Sheep.—Lots were sold at \$1 62, \$1 71, \$1 92, \$2 08, \$2 42, \$2 62, \$2 88, and \$3 25.

Swine.—A large number were sold at reduced prices. The entire lot sold at 4 for sows and 4 3-4 for barrows. Lots to peddle at 4 1-4, 4 1-2 and 4 3-4 for sows, and 1-4, 5 1-2 and 5 3-4 for barrows. A lot of old hogs, sows at 4 1-4 and 4 3-4; barrows 5 3-4 and 6. At retail 5 1-2 and 6 for sows, and 6, 6 1-2 and 7 for barrows.

Erratum.—In our report last week peddling lots were reported one cent less than the sales.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded northerly exposure, week ending September 29.

A FARMER WANTED.

A man and wife or a single man are wanted to carry on a farm about 14 miles from Boston, for which reasonable wages will be paid. None need apply but Americans and those that are acquainted with Farming and Gardening, first rate recommendations will be required for honesty and sobriety. Please apply at this office. September 25.

A Young Man Wanted on a Farm.

The advertiser is in want of a *smart young man* that is well acquainted with the cultivation of *vegetables*, and one that is also capable of taking charge of *horses, cows and swine*, one that understands it, *he must be energetic, active and fond of neatness and order*; he must produce evidence of a *good moral character*. Such a person may find a permanent situation by calling on Messrs BRECK & CO. None need apply but such as answer to the above. September 25. 1839.

Massachusetts Horticultural Society.

The members of this Society are hereby notified, that on Saturday, the 5th of October next, at 11 o'clock, A. M. at their hall in Tremont Street, the officers of the Society for the ensuing year, will be elected, viz. a President, four Vice Presidents, a Treasurer, a Corresponding Secretary, a Recording Secretary, a Council, an Executive Committee, and Standing Committees on Fruits, Flowers, the Synonyms of Fruits, the Library, and on Finance. R. T. PAINE, Corresponding Secretary and ex officio Recording Secretary pro tempore.

Boston, September 11.

Morus Multicaulis Trees from Seed.

The subscriber offers for sale 10,000 trees produced from seed of the genuine *Morus Multicaulis*. The seed was raised on his premises in 1825; the trees have been multiplied for the two last years by layers, their growth is more rapid than the original tree, and appear to be sufficiently acclimated to endure the winter, some of them having been left standing in the open field unprotected during the two last winters without any essential injury. The leaves are very large and equal in quality to any other kind for feeding the silk worm. Those who are wishing to purchase a superior kind of Mulberry are requested to call and examine for themselves, before the foliage is destroyed by frost.

CALVIN HASKELL.

Harvard, September 11.

MULBERRY TREES.

The subscriber has on hand a quantity of Mulberry Trees of a quality which is probably superior to any kind ever introduced into this country. They were imported four years since and though they have sustained the rigorous cold of the last three winters entirely unprotected, yet it is believed a *Southern or Western* climate would be more admirably adapted to their growth and propagation. Their foliage is most luxuriant and affords more nourishment than any other variety. Silk produced by worms fed with the leaves, has been pronounced by judges to be the best ever manufactured by them, and decidedly superior to the best Italian. A few thousand will be for sale if immediate application is made to the subscriber, where specimens may be seen.

Also—A few hundred *Morus Multicaulis* and Asiatic. JOHN N. BARBOUR, September 11. No. 30 Commercial Street. Boston.

Complete Garden and Horticultural Tool Chests,

From Sheffield, England; containing Garden Shears, improved Pruning Shears and Scissors, Pruning and Grafting Knives, Flower Gatherer, Garden, Dutch and Triangular Hoes, Saw, Spud, Weeding Hook, Garden Rake, Trowel Hammer and Garden Reel; comprising every useful implement necessary for the cultivation of the Flower Garden. For sale at the New England Agricultural Warehouse, No. 51 and 52 North Market Street.

BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells. Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

WINSHIP'S BRIGHTON NURSERIES,

AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c. Orders addressed to Messrs WINSHIP, Brighton, Mass. will be promptly executed, and forwarded to any part of this or other countries. April 10.

BERKSHIRE BOAR.

For sale, a fine Berkshire Boar, 3 months old, and large, of his age, bred in Albany, from imported stock. The pedigree will be furnished at the time of sale. Price \$50. Apply to Messrs. J. BRECK & CO. September 18. at

The subjoined address of Chief Justice Shaw, delivered recently at the Centennial Celebration in Barnstable, Mass., is so full of charming sentiment, and shows so strongly the workings of the finest feelings of our nature, that we are happy to be able to enrich our last page with it. H. C.

After the eighth regular toast, some remarks were made by Chief Justice SHAW, of which the following is a sketch:

Mr. President—It would be more affectionate in me, not to understand at once, that the sentiment now expressed, alludes to myself. Such an expression of kind and respectful remembrance, by such an assembly as the present, on an occasion so full of deep and solemn interest, fills my heart with unmingled gratitude, and I can do little more than to express to the company my heartfelt thanks.

To be held in cherished remembrance by my earliest associates, the friends of my beloved parents, the companions of my infancy and childhood, by those who cherish an ardent love for my dear native land, whatever may be their pursuits, or wherever their residence—his indeed affords me a gratification which I would not willingly exchange for any advantage which rank or distinction could confer.

Here, on such an occasion, all minor distinctions of occupation, of condition, of fortune and residence, vanish before the one deep, absorbing sentiment which binds our hearts indissolubly to our native soil. Here the merchant may rejoice to come, leaving behind him, for a time, his ledgers and accounts, leaving his ships, his stocks, and his merchandise to take care of themselves: the clergyman, in perfect consistency with his holiest duties, may for a short time leave his pulpit and his flock: the farmer may well leave his fields and his marshes: the seaman his vessel—the shoeman his fish flakes—and judges and lawyers are glad to tear themselves away from the wrangles of the courts, and the turmoil of judicial controversy, to indulge together, for a few brief hours, in the cherished recollection of by-gone years—recollections always dear though often sad. But joyful or sad, prompted by the better principles of our nature, and deepened by a common sympathy, we know and feel that they bind thousands of hearts in one common feeling of mutual attachment.

And why should it not be so?—Indeed it is good for us to be here—to be here upon such an occasion, and to yield to the thoughts and feelings which come thronging upon us. Sir, there's pleasure and profit in it—there's wisdom, philosophy, and religion in it.—Was not this the home of our infancy and childhood? Here we first felt the dear delights of parental love—here the first thoughts and feelings of our social and intellectual nature were enkindled and developed—here we first felt the pleasures of friendship and the joys of social existence, when every feeling carried with it the purity, the ardor, and the joyous freshness of youth.—Why sir, every house, every field, every grove has its history, and brings back a clustering throng of recollections. Every local object is a talisman, which revives its long train of remembered joys, or sorrows, amusements and occupations: the school, the wedding, the funeral, the social circle, the play ground, the meeting house, the burying ground:—time would fail me in naming a mere

list of the thousand objects, which awaken vivid recollections of the past, and above all—more than all, remind us of those who participated in our early affections and friendships.

And is it not good thus to be moved sometimes by a noble feeling of generous sympathy and affection? Does it not teach us all, the merchant, the seaman, the farmer, the lawyer, each and all of us, whatever our employment, or whatever our success in life, that there is something worth living for besides profits and wages, and fees and salaries; that there is something in the joys of memory—of hope and imagination—in our social affections and sympathies—in the consciousness of our moral and intellectual being, which rises above the ordinary routine of cares and labors, whose object is bounded by the acquisition of mere worldly goods? May it not even inspire a holier thought? If, as we feel and know, these attachments and sympathies so closely connect the past with the present, may it not lead us to indulge the hope, to rest on the assurance, that there shall be some similar connection between the present and the future—that the affections of the soul, so pure and perennial, are not destined to have their full accomplishment here, and shall not be crushed and annihilated by the termination of our earthly existence, but that, surely, there is another and a better life?

But sir, let us not be thought wild or visionary, or to depart too widely from the spirit and feelings of the occasion. Indeed the very spirit of the occasion is, to perceive in the persons and objects around us, not the mere visible and sensible images, but the recollections and feelings which they suggest. Take a single instance. Did we not observe, as the procession was moving on to-day, a long range of hills skirting the town? You and I, sir, know it by the name of Sandy Neck. And what does it present to the eye of the casual observer? Why a range of sterile sand hills, interspersed with a few patches of brown woods and swamps, and surrounded by marshes. Who of us, has not heard the tremendous roar of the surf, as his mountain surges lash the long line of beach back of those hills? But to the eye of the native Cape Codman what does it suggest?—a barren waste of waters—a barrier to his exertions—a confinement to his sterile soil? Not at all. It reminds him of the ocean that lies beyond—the ocean with all its grand and beautiful associations. He looks at it not only as the field of his fame and of his glory, but as the field of industry and enterprise, of his enjoyment and improvement, ay, even of his social and intellectual improvement. It connects him with all lands—with all that is magnificent in nature or polished in art—with all that is valuable in knowledge, refinement and civilization. His neighbors are not those only, who live in the next town, or state, or kingdom: wherever there is commerce, there he has neighbors and friends. He not only repeats the words of the seaman's song, but imbibes its spirit—

"In every clime we find a port,
In every port a home."

But the home of his memory and his affections is here:—to his native land, amidst all his wanderings, he looks with a steady eye; and whatever acquisitions of property, or pleasure, of hospitality and friendship he finds elsewhere, he regards them all as the means of comfort and enjoyment on his return. The land and the sea are alike fertile to those who have the hardihood, the skill and the enterprise to improve them, and the hearts to enjoy

them—and they are alike sterile to the idler, the dissolute and the heartless. Indeed, that soil can never be deemed sterile, which yields a large and steady growth of intelligent and enterprising men, and of amiable and accomplished women.

But I am encroaching on precious time, and will only propose as a sentiment—

Cape Cod—our beloved birth place;—may it long be the nursery and the home of the social virtues—a place which all her sons and daughters, whether present or absent, may, centuries to come, as in centuries past, delight to honor and to love."

New York Urate and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are not divided among the Stockholders, as are those belonging to another establishment, but sold, to applicants, for cash on delivery. Orders are supplied in the order of time in which they are received. Urate 50 cents and Poudrette 40 cents per bushel, with contingent charges for bags or barrels, &c.

The company are daily preparing for use, during the warm dry weather, the materials collected during the past year, and will have stored about 1000 bushels ready before the first of October next. The material is disinfected and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1838 and 1839, on Long Island, has satisfied many of the farmers that these manures have the *quickest* operation upon vegetable matter, producing a *greater abundance*, and the *cheapest* of any manure they have ever tried.

An *analytical* instructions for their use, the result of practical experience, will be furnished on application. The effect of Poudrette upon *Grape Vines* and *Morus Malticulis* is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manures and farmers and gardeners may confidently rely on a supply. Orders, post paid, directed to "The New York Urate and Poudrette Company," Box, No. 1211, Post Office, New York or sent to the store of STILLWELL & DEY, No. 365 Fulton Street, Brooklyn, will be attended to.

The Company will be very much obliged to gentlemen who have used the manures, to give them a statement of their results, and the result of their use and experiments in relation to them.

New York, August, 1839.

Hale's Patent Horse Power and Patent Threshing Machine.

JOSEPH BRECK & CO. offer for sale this valuable machine and feel great confidence in recommending it as the best machine now in use. It will thresh from 75 to 10 bushels per day in the best possible manner. The horse power is calculated to propel any kind of machinery is very simple in its construction, occupies but a small space of one foot by 120, and can easily be transported from one place to another, and when combined with the Threshing Machine it forms the most superior article for its purpose ever invented. They can be supplied at short notice at the N. E. Agricultural Warehouse and Sec. Store. August 23.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Sec. Store, No. 51 and 52 North Market Street, offer for sale, Green's Patent Straw, Hay and Salk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very effectually.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

THE SPIRIT OF THE AGE—AGRICULTURAL PAPERS, &c.

MR EDITOR—The strongest characteristic of the age we live in, is the spirit of progress and improvement which pervades the community: improvement in every thing susceptible of it:—improvement in art—improvement in science—and, may I not add, improvement in human nature. There exists, in fact, a *progressive excitement*—and so long as its effects shall be to substitute right for wrong, to develop mind and stimulate genius to invention, it is to be hoped it may not subside.

Among the arts and sciences which have felt, in different degrees, the beneficial influence of this improving spirit, is to be named agriculture. (I allude particularly to our own.) The obstacles which have heretofore prevented this great national interest from being as an art better understood, and as a science correctly practised, are fast being removed: error is receding before the quickened march of mind, the light of science, and the convincing deductions of reason and philosophy;—deep-rooted prejudices, venerated rather for their antiquity than their worth, are giving way to the enriching truths of modern discovery;—twin-fettered ignorance and superstition are fast losing their baleful influence over human affairs, and men are beginning to see and appreciate the might of mind when enlightened by science.

It is well for the prosperity of our country and its every interest, that the improving spirit abroad is effecting a revolution in our husbandry,—a revolution of mind and a revolution of matter;—and, as these mighty agents of good or evil 'never go back,' we can look with confidence for the consummation of the desired reform which has commenced and is rapidly progressing in those parts of our country where light hath reached, reason convinced, and practice demonstrated. Through all the clouds which yet hover around, the attentive observer cannot fail to discern 'the dawning of a brighter day for American agriculture,'—a day which shall give the modern system of farming the ascendancy over the old 'exhausting system,' whose only honor is its age. We do not believe that error can long flourish when right is abroad to combat it;

"Truth crushed to earth will rise again;
The eternal years of God are hers;
While Error writhing, lives in pain,
Or dies amid her worshippers."

The old system of cultivating the earth has little of right in any of its processes.—It was conceived in error and brought forth in ignorance:—the modern system is the offspring of science, and bears on its front the impress of right: it is supported by reason, by philosophy, and by the experience of the intelligent; and as soon as it is generally understood it will be generally adopted: the prosperity of the country demands this: its independence calls for it; and it may be necessary for the perpetuity

of our existence as a free nation; for, judging from the sad history of past republics, liberty finds support in agricultural strength and danger in commercial greatness.*

What are the causes which have combined to prevent agriculture from advancing with the other arts and sciences? They are to be found in the prejudice of farmers for ancient customs; in their (seeming) unbelief in the progress of mind and consequent aversion to improvements; in their hostility to what they term '*book farming*,' which may be defined the practising of scientific truths and the recommendations of the intelligent, promulgated through the press. These are the principal causes which have operated to retard the progress of improvement in the rural art. Thanks to agricultural newspapers, they do not now exist to the extent they did a few a few years since, but their prevalence is still extensive,—by far too much so for our national independence,† for the pecuniary interest of the husbandman and for every interest of the community. How shall it be lessened? *By the dissemination of knowledge among the yeomanry.*—'Knowledge is power'—it confers the power which the farmer needs,—the power of making every inch of land productive, and to produce to the extent of its capability,—the power of overcoming by art the obstructions of nature. The knowledge which will give this power, is most easily found and conveyed in agricultural papers. These are within the reach of every cultivator, and should be patronised by all—as well by the indigent as the opulent; for their tendency is, not to make the rich richer at the expense of the poor, but to make the poor happier in an increase of their crops, and show them how to become independent of the rich. There is not a whit of economy in refusing to become a subscriber to one of these publications. He who has but one acre might be learned through this means how to cultivate that so as to treble his usual products, alike with him of his hundred acres: at any rate, either could not fail to be benefited by a year's reading of a paper, to more than treble the amount of the subscription price. This is proved in the case of those who are subscribers. It is a fact worth noting, that you seldom (I might, probably, say never), meet with a subscriber to an agricultural paper who does not set a high value upon it, or who is in the least dissatisfied with paying a dollar or two a year for its personal. Such an investment of money is in their opinion the best they could possibly make, as none other to them yields so great an interest. I was told by a farmer—a subscriber to Judge Buel's Cultivator—that a plan which he found in that paper for steaming apples, potatoes, &c. for his swine, had been of a vast deal more consequence to him than a dozen years' subscription money. Such instances are common,—in fact it is absolutely impossible, in our view, that some

*I mean to be understood that the freedom of a country agriculturally great, is more secure than that of a country great only in a commercial sense.

†However independent we may think ourselves, we cannot in truth be styled independent, till we cease to rely upon foreign nations for some of the essentials of life.

useful information or valuable hint should not be acquired in the course of a year's reading, which will not repay many fold the price paid for the paper.—Farmers need to be made aware of these facts, and to be shown through the convincing means of experiment, how falsely founded is their notion of economy in refusing to take a paper devoted exclusively to their interests.

These vehicles of knowledge are productive of good in another respect;—they take with the young—with those whose minds are not yet warped by prejudice nor fully imbued with false notions,—with whom any thing novel and plausible in theory, begets a passion for experiment. I will state an instance the better to illustrate my meaning. A farmer of my acquaintance in New-Hampshire, was bitterly prejudiced against all other modes of farming than that practised by his ancestors from the earliest generation, and transmitted unimpaired (and *unimproved*) to him. He was loud in his abuse and ridicule of '*book farming*,' about which he talked as learnedly as he could of other matters whose discussion renders something more than a *knowledge of the alphabet and two ideas* necessary—declaring, in his wisdom, that it was 'intended for the wealthy and college *larnt*,' and that 'he was'nt fool enough yet to plant his land with *mulberry trees*! and buy corn to live on,' &c. This man had a son—a lad of some nineteen years—who was much inclined to reading, and who had often endeavored to induce his father to subscribe for an agricultural paper, but without effect. The father had the misfortune to be stricken with a dangerous sickness, and the management of the farm devolved upon the son, who had obtained the parent's consent to conduct it as he pleased, with the proviso that he should plant *no mulberry trees*. As a preliminary step to the reformation contemplated, the son subscribed for an agricultural paper and followed '*book farming*' to the extent of his means: the swamp was resorted to for materials for compost, (an idea which never entered the head of the father,) lime was purchased for manure; the swine were increased to increase the means of fertilising the soil; root culture was adopted—alternating crops—manuring by turning in green crops—for which last act, in particular, he incurred the censure of his neighbors, who were unanimous in pronouncing him a '*fool*,' '*notiony*,' '*crack-brained boy*,' &c.)—and such other improvements made as he found suggested in his paper.

The beneficial change which had been wrought in the order of things on the farm, was so palpable and manifest as to excite the wonder of the father at his son's unexpected success, and he could not help acknowledging that his prejudices against '*book farming*' and agricultural papers were ill-founded and supremely foolish. This farm, under the father's exhausting culture comparatively a desert, and yielding but a poor return for toil, has, by the scientific and skilful management of the son, been made to teem with plenty and well reward for the sweat of the cultivator's brow. I have heard this farmer declare that his yearly profits did not exceed \$100, and grumble at his '*hard lot*.' Under

is annually cleared.

This case is no fiction—and if it were, it would be a faithful representation of many unwritten instances of like results.

If agricultural papers, then, are productive of so much good—if their tendency is to "make two spears of grass grow where but one grew before," no means should be spared to extend their circulation: let the farmer who is a subscriber induce his neighbor who is not, to become one also;—let agricultural societies lend all possible aid in the cause. I can conceive of another method for advancing my object:—In every village there are generally two persons upon whom the citizens bestow extraordinary respect, or a sort of voluntary reverence, on account of their (supposed) superior intelligence.—I mean the minister and the physician. Suppose these important personages should exercise the influence they are capable of, to the end of improving the agriculture of their towns, by inducing their fellow citizens who follow the plough, to read—to improve the mind in order to improve the soil,—could not the great object of enlightening the yeomanry—the hard-handed, honest-hearted yeomanry—be furthered by such a praise-worthy movement?

It is, chiefly, to the influence of such papers as the New England Farmer, the Albany Cultivator, the Genesee Farmer, and others of a like character, that our improvements in rural economy are to be ascribed;—that influence needs encouragement—encouragement from States as well as individuals,—it needs to be more widely diffused; for, in proportion as it is extended, in nearly that same proportion will the profession of agriculture be exalted in the public estimation, its operations facilitated, and its products increased.

J. H. D.

Boston, October, 1831.

[For the New England Farmer.]

BEES.

MR COLMAN.—We wonder every body does not keep bees, such active beings as they are and so liberal in dispensing "the sweets of life." Yet we are glad they do not, for if they did, even though they had a "small beginning," they would at length become so numerous that sad consequences might result. This we have found to be the case to our cost, for in the Spring of 1831, we established a colony, which, as there were none about us, did very well, and our success excited others to embark in the same enterprise, so that in two years they were "as thick as bees" through the neighborhood and town. The consequence was, all the bee pasture in the community was overstocked, and the long, severe winter which followed put an end to all our anticipated sweets, inasmuch as that there was scarcely a hive remaining in the circle of our acquaintance, whose inhabitants could be numbered among the living. We might have saved ours in a way which we shall speak of soon, but they had a usual supply of honey and we did not expect an unusual winter.

Last spring, we obtained a hive and began again. Maugre the cold wet May and June, we have obtained three swarms from it, the hives of two of which are very heavy and the third in quite a winterable condition. Our first swarm came off about the middle of May, and lit on a currant bush, consequently we had no trouble in living it, but the second which came off only a few days later, displayed an obstinacy worthy of the human spe-

cies, for they lit on the body of a beautiful maple on one side of our yard, just at the place where the lower branches put out, we tried almost as many devices to get them off as the "old man" did to drive "the rude boy" from his apple tree and with no better success; we jarred the tree, but we could not jar them off; we tried to brush them down, but to this they objected; we confined a hive to the tree, and wound a cloth around it and then, hoping to lure them to a domicile in this way, but they had no more ambition to climb, than propensity to descend. We however secured them where they were in this way, for that day and the coming night, which brought the elements to our aid in the form of a "hoarse north easter" cold with wind and tolerably charged with rain, which two qualities united so benumbed the physical faculties of our trusty friends, that we could dispose of them as we pleased; we accordingly with all care took them down and placed those which possessed animation in the hive, while the remainder we protected from the storm, and on the first sunny day laid them out to dry. Most of them revived and joined their family, but their tranquillity was of short duration, for in consequence of their exposure, a dysentery attacked some of the community, and those in health, instead of remaining to protect the weak and heal the sick saw fit to decamp, and after enjoying a healthful sailing excursion in the air they went to the hive in which the first swarm had been put. Their stay there was not very tedious, for in a week or ten days and instead of aspiring to the trunk of a choice shade, at ten feet from the ground, their "neek and lowly spirits," led them to cluster on a raspberry bush but a few inches from the surface, from which they were taken and put in a condition satisfactory to themselves as their quietude and thrift fully attest.

Our last swarm came off in June, and not withstanding the old adage that "a swarm in June is not worth a spoon" we should refuse an offer of two spoons for this, and more unless they were very nice and very heavy. True, the quantity of honey which they have gathered is not very great, but with our way of managing such hives we think amply sufficient for their supply. We propose burying them, through the winter, a practice which we have adopted in two successive years, and had we continued it the third, our old colony instead of coming to an untimely end, would probably have been in existence now through its descendants.

My method of burying bees is as follows. The operation is performed the last of November. The pit in which they are to be placed is dug considerably larger than the hives, in every respect. On the bottom of the pit two sticks say of scantling four inches square, are placed that a cavity may be left into which the water if there is any may settle and run off without injury to the bees. On these blocks I lay my floor board, which should be sound and full an inch thick, if more no matter. The top of the hive should be covered with a two inch plank, or if more convenient a piece of wide thick slab with the rounding side up, so that if the frost comes out, and heavy rains fall it may serve as a roof to carry the water from over the hive and turn it into the pit below. Straw is then placed as compactly as may be around the hive and the earth thrown on so as to form a cone above it, which again operates as a roof to turn the water as it falls. With regard to the depth of burying we can only say, that in our former experiments, we never sunk the top of the hive below the surface. Whether it

would be well to do so we cannot say. Some when burying their bees, drive down a stake near the hive as they say to admit the air, but we do not see why a stake drove down with the earth compactly placed around it, can form an air hole more than the earth itself. And if it could, we do not see the necessity of it, for the object of burying bees, is to put them as much as may be in a state of dormancy through the winter, by which their stock of provisions is lengthened out, to secure them from sudden and often fatal changes from heat and cold and from storm and sunshine.

In selecting a place for burying it is important that a dry one should be chosen, and we prefer one that is cold to a warm one, and could we regulate the condition of the earth around them, we would freeze it the night after their burial, and keep it frozen until time for their exhumation in the spring.

We in both instances of our former burying, took them up some of the last days of March, and all the dead we found from the four hives thus kept would not half fill a person's hand, and on exposure to the sun and atmosphere the living were as bright and lively as though they had known no winter, and they gave swarms earlier and more frequently than did the hives that were not buried the ensuing summer.

We have thus far kept only the old fashioned square hives, but intend during the coming winter to have some manufactured after the Griffith and perhaps other plans. We shall do so, not that we have any particular objection to the square hive, but in order to profit by improvements in the article; and to do this we wish to give each variety a trial.

Our hives have uniformly been made of pine boards, and put together in the closest manner possible, after which we have spread a salve made of beeswax, tallow and rosin over the joints within and without. This wax gives the hive an odor very pleasant to the bee, in consequence of their wax being a part of its composition. It also closes the small apertures which are most always to be found in bee-hives against the invasion of the miller one of the most formidable enemies to bee culture, and where the hives stand out, as they often do, it prevents the storm from beating through openings, which if no preventives be employed, are always increasing in size. Any sweet wood is undoubtedly good for hives, but economy and durability should be consulted in their manufacture as well as every thing else. Hence the cheapest material that can be used, with the approbation (we can do nothing without this) of those who are to inhabit them, should be. Basswood is cheap and sweet, and we know not why a basswood hive, kept sheltered, would not last for ages. To secure its durability it may planed on the outside and painted, and we know not why the industrious bees would not enjoy a neat white house, and are not as worthy of such a one as many biped drones who inhabit them. We think the practice of placing boxes on the hives for obtaining honey a good one, especially when the swarm is thrifty. After the proper season of swarming time is passed, the box may be placed on the hive and prevent future swarms from coming out, and in this way the increase of bees may be saved in the old hive, where there will be honey enough for them, and new swarms come off earlier the next season, while as much honey may be obtained from the box as the late swarm would collect, without the sacrifice of their lives. The honey thus obtained is of the purest quality. The aperture in the top of the hive through which they pass

to the box should be closed when the box is removed, and remain so until it is replaced the next summer.

Bees pasture. The man who turns his herds or his flocks upon their own resources for a subsistence, can expect but little profit from them, unless they become highway robbers, (and then the partaker is worse than the thief) and enter his neighbor's fields and spoil his crops. Though we have no idea that a community of bees can be restrained by fences, pokes or fetters, yet we do think that their rambling propensities may be checked. The facilities of their labor increase their enterprise, and the encumbrances of their home made still more dear by—we should have said cultivating flowers for their benefit, but this would sound *wink* to the ears of some strong minds, so to such we say allowing them to grow.

But the ladies admire flowers—so do gentlemen, therefore we have no hesitancy in recommending their culture, especially when so many objects of utility demand it, as in the present case. The mignonette is a beautiful little flower, and when once sown will keep itself in, if the ground is kept clean. It continues blossoming very late, its fragrance perfumes the atmosphere agreeably, to a great distance, and bees are as fond of it as we are of honey. The raspberry and bramble flowers are favorites with them, and we never heard a person say that they did not like their fruit, so they should be set plentifully in the garden and cultivated, that they may, at home, produce an abundance of flowers for the bees and fruit for man. The strawberry too, that we unitedly love so well, should always be found growing for our mutual benefit in our common gardens. The poppy, though somewhat calculated to lull the drowsy faculty of man to repose, possesses not the least lethargic quality to them, but in the reverse arouses their faculties. Catnip not in mints or juleps, but in blossom, they much admire. We too have tested the efficacy of its healing qualities through strong potions of its tea.

Yours truly, W. B.

Mount Oscola, Oct. 4, 1839.

CARELESSNESS IN SAVING SILK-WORMS' EGGS.

To the Editor of the Farmers' Register.

Stafford, Aug. 5th, 1839.

I am highly gratified that you have given the agricultural community a caution about silk-worm eggs. At least two thirds of the failures in rearing silk-worms in this country may with propriety be attributed to bad eggs. Many persons raise silk-worms for the sole purpose of speculating on the eggs, and are probably not aware of the necessity of careful management to procure good eggs. Prevailing thoughtlessness on this subject, which I know exists extensively, if not checked, will throw serious obstacles in the way of this important culture, which I firmly believe is destined to repopulate the poor land districts in Virginia and Maryland. I will add a caution which may be of service to the inexperienced. If the cocoons intended for seed are thrown into a heap, and permitted to remain for several hours, when the weather is warm, the eggs produced will generally be worthless. I know this to be the fact from dear-bought experience.

When silk-worms are to be raised, the eggs to be procured from the cocoons, must be thought of before anything else. Now-a-days when the cocoons are collected, it is the custom to keep them

altogether upon the frames. Some persons not having time to reel all their silk, butterflies are seen to go out and lay eggs almost immediately. The accumulation of cocoons produce a kind of fermentation, and the heat causes the butterflies to hatch before the proper period. This premature development has never any good results, for the butterflies are sick; and from thence it comes that the silk-worms produced from their eggs, are affected by diseases from the moment of their hatching.

"The cocoons for reproduction ought to be separated, and put in a well aired chamber, and spread upon very clean mats, a layer of the thickness of a single cocoon only." (*Chinese Treatise, published by P. Forre, p. 150.*)

I have about 40,000 silk-worms of seven varieties. They are remarkably healthy, and a large portion of them spinning in handsome style.

Respectfully yours,

LAYTON V. ATKINS.

P. S. There is no advantage to be derived from a forced and premature development of the silk-worm in any of its stages. The nearer the time of spinning to the natural period of its life, as stated by Dandolo, the better. The precocious and the tardy are always feeble, and eggs should never be saved from them. I have made nine rearings of the "two-crop" white, and of the cocoons formed between the 25th and 30th days it has required from 700 to 800 to weigh a pound, and so of the last which spin; but of cocoons formed from the 30th to the 35th day, 350 to 400 to make a pound. Depend upon it modern writers on silk-culture are promulgating a pernicious error on this point; and before the learned silk-worm doctors publish any more infallible prescriptions, I advise them to put on their spectacles and bring their remedies to bear on four or five cases.

If a forced and premature development is so important, what reason or sense would there be in the following passage from the Chinese Treatise:

"The moths which come out the first day are called grass moths. The last of all are called mogno, (that is to say, the last butterflies.) Neither of these ought to be kept."

Mark the care of this people about procuring eggs. Cocoons are first selected, and when the butterflies come out, the first and the last are rejected. Let the people of the United States make numerous and careful experiments. We beardless boys of Virginia at least, do not mean to open wide our mouths and swallow nostrums as an unledged bird does its food.

L. V. A.

CAUSES OF SEEDS NOT GERMINATING.—We have known and heard of considerable loss and disappointment from seeds, particularly onion seeds, not growing. We have thought and inquired in reference to the cause, and the result of our cogitations and inquiries may be thus stated.

Without a certain degree of moisture, seeds will not germinate. On dry sandy soils, and in a dry season, it seems highly probable, then, that seeds may be deprived of the requisite degree of moisture: perhaps receiving just as much as will mould them and destroy their vitality, or being so near the surface as to be injured by the sun's heat and light.

But the seeds may have germinated, and have commenced to send out their roots and stem stalks and yet be destroyed. If the soil is not pressed closely to the seeds, and very dry weather occurs

just at this period of the process of germination, the root being too distant from the soil, and too feeble to draw any supply of moisture, the liquid food of the plant contained in the fermented seed may be dried up, and the life thus destroyed.

If you would avoid disappointment and loss from seeds failing to grow, the preventive process is indicated by a knowledge of the causes most frequently productive of this result, which we think are those stated above. If you sprout your seeds before putting them into the ground, you will preserve them from the first cause of failure, but if you pulverize your soil thoroughly and press it in this state with hoc, spade, or roller, upon the seeds thus sprouted, the root stem will soon and surely derive sufficient moisture from the soil.

In a few instances I have found my neighbors blaming the seed as useless, particularly of onions, carrots and parsnips, when I have obtained a little of the seed, and found it to sprout quite well. You may easily save yourselves from such reflections, or from the temptation to blame others, by steeping the suspected seed in warm or tepid water from six to twenty-four hours, according to the size and hardness of the seed, and then setting it away in a warmish place for a day or two. If good it will sprout in this time; if kept warm in a darkish place, and it does not sprout in this time, the seed is faulty.

In connexion with this subject, I may state that several circumstances incline me to the belief that corn which has been sprouted—no matter in what steep—is safe from the ravages of the red or wire-worm. It has been fashionable to steep in a strong solution of copperas, and to ascribe the safety of the seed in this state, not to the change which fermentation has produced in the germ or chit which is usually first attacked, but to the change in the taste from the copperas. We have known corn soaked in simple water—in water alone—to escape from the attacks of the worm as well as that soaked in a copperas steep. Until this matter is made more certain however, I would hold it bad husbandry to neglect the copperas, as in addition to the change produced by heat and moisture, we have also the disagreeable taste communicated by this salt.—*Cultivator.*

FRUIT TREES.—The famous Pickman farm, in Salem, the best in the country, is lined round the borders of the fields with engrafted apple trees.—These trees are very thrifty, deriving most of their nourishment from the ground under the walls, which keep the soil loose, warm and moist, and preserve the roots of the trees from external injury. The trees in this situation are an ornament to the farm, while they are no hindrance to the farmer in cultivating his field, nor injury to the crops by withdrawing nourishment, like those in the interior of the field. Yet those trees round the field are believed to yield a greater profit than the annual crop within, with all the labor necessarily bestowed upon it—and the annual sales of the apples and fruit on this farm are said to be enough to purchase a farm of moderate dimensions in the interior of this State.—*Newburyport Herald.*

In the Irish Gardener's Magazine it is stated that the decoctions of the leaves of the common camomile, will destroy insects, and that nothing contributes so much to the health of a garden as a number of camomile plants dispersed through it.—No green house or hot house should ever be without camomile in a green or dried state.

THE CANKERWORM.

We would invite the attention of our citizens to the following article on the Cankerworm. The renewed foliage with which our shade trees are now covered, has in some degree removed the apprehension entertained a few months since, that we were in danger of losing one of the chief ornaments of our city. Our citizens ought to be apprised, however, that the effort required to put forth two sets of foliage annually, cannot be sustained, ordinarily, longer than two or three successive years. For one year, or two, this may occur without serious detriment; but the third year commonly proves fatal to the tree. Many of our most valuable ornamental trees have now been completely denuded two years in succession, and unless measures are immediately taken to secure them from the ascent of insects this season, many of them will probably be lost next summer. The insects will now soon begin to come out of the ground, so that what is to be done ought to be done immediately. We return our thanks to the anonymous author of this communication, which comes to us under the post-mark of Philadelphia, and will forward copies of the paper as he has desired.

Entomology of the Cankerworm—Phalena Ver-nata Geomdia.—PECK.—With general remarks upon the various remedies or preventives.

From the numerous remarks that I have heard made in various parts of the country, I was led to believe that the character and habits of the Cankerworm were very imperfectly understood. And as its ravages appear likely to destroy a considerable portion of the fruit and ornamental trees, I was induced to study its entomology; and believing it might be useful to those interested in its destruction, I concluded to offer the result of my labors to the public. And I would here suggest to the editors of newspapers, who are fond of fruit, and like to see flourishing trees, to insert the following account for the benefit of their readers.

The Cankerworms begin to hatch in the spring, about the time the red currant is in blossom, and the apple tree puts forth its tender leaves, which in Boston, is about the last of April, or the first of May. When first hatched, they are about one tenth of an inch long, and as large as a fine horse hair. Having made their escape from the eggs, they move about with great activity in search of food, and having arrived at the extremities of the branches, they begin to feed upon the pulpy part of the leaves. And if a leaf is taken and held against the light, it appears perforated with numerous small apertures, like pin holes. They acquire their full growth in about four weeks. During this period they cast several skins, each succeeding skin being larger than the previous one. The number of these and the time intervening, is not ascertained. As they pass through these stages they become more and more voracious, and in the last stage are more destructive than in the whole of their previous existence, and make no hesitation in destroying the entire foliage, but eat the green fruit.

These worms spin a continuous thread as they move about, and leave it attached to their path;—hence, if a branch of the tree is struck so as to give it a sudden shock, the worms may be seen suspended beneath by this silken cord; and when the shock has ceased, they ascend to the place from whence they fell. Immediately beneath the

mouth, there is a conical papilla, from whence the fibre that suspends them is emitted. Their ascent, when thrown from the tree, is slow, and is performed by bending the head and anterior part of the body back, until the feet in the third segment can grasp the thread; then bringing the head forward, they seize the thread with their jaws; thus continuing to fold it up until they reach the branch of the tree. They pause at intervals if the ascent is long. If by chance the thread should get broken, they crawl to the trunk of the tree and ascend.

The larva, or caterpillar, is, when full grown, about nine tenths of an inch in length, and one eighth of an inch in diameter; the head pale, marked on each side with two transverse blackish stripes; the back ash-colored, marked lengthwise with small, interrupted dusky lines; the side blackish, with a pale line along the length of the body. There are two white spots upon the last segment of the body. The abdomen, or under side, is ash-colored. In moving about, they draw up the hinder part to the breast, bending the body into the form of the letter *n*; then extending the body to take a new grasp with the anterior feet, thus appearing to measure the space over which they pass. From this circumstance they are called *geomidia*, and in English, lopers, span-worms, inch-worms, &c.

In about four weeks after they are hatched, they cease eating, and descend to the earth and enter it, from four to eight inches, according to the quality and condition of the soil. For the first few days they continue shortening their body, and drawing in their feet. When they have contracted themselves sufficiently, they disengage their skin and slip it off, and become a chrysalis, which is about half an inch long, and one seventh of an inch in diameter.

It appears that the insect is soon perfect, as some of them in New England rise from the earth as early as the last of September, and they rise, more or less, until the first of May following, whenever the weather suits them, and the ground is thawed to the depth of their abode.

When they rise from the ground they appear in forms entirely different: the antennæ or horns of the perfect insect are setations. The body of the male is of an ashen amber color, nearly half an inch in length; extent of its upper wings one inch and two tenths; the wings are ash-colored with three obscure blackish stripes, and a small dash of the same color at the tips. The under wings are of a uniform color, and rather lighter than the ground of the upper ones. The body of the female is about four tenths of an inch in length, ash-colored and marked on the back with a brown list, extending from the thorax to the tail. She is destitute of wings, has six long dusky legs with white joints. Both the male and the female remain quiet during the day and adhere close to the bark of the tree, and are so near the same color they are not seen without close inspection. In a short time after sunset they begin to move. The males may be seen flying about. The females being destitute of wings, are under the necessity of ascending the trunk of the tree. They may sometimes be found together, subcupola. After this office is performed the males die, and in a few days the females deposit their eggs, about one hundred in number, which are deposited on the branches of the tree and generally near the extremities. The egg is of an elliptical form, about one thirtieth of an inch in length, of a pearl color, with a yellowish cast. As

the included animal advances, the eggs assume a brownish hue, and finally become lead colour. The eggs adhere firmly to whatever they are laid upon and appear something like the top of a thimble—except the indentations are much finer, and when laid in the fall are not injured by freezing but hatch about the time before mentioned. During the last stage of their existence they do not eat any thing. The female after laying her eggs, having accomplished the object of her existence, dies. Cold weather does not have any effect upon the chrysalis moths or eggs further than to benumb the mollars and grubs (grubs is the name usually applied to the female), until it becomes warm again. For if the insects in this state, when it is extremely cold, are carried into a warm room, they soon become active. A piece of ice containing a number of grubs was carried into a warm room. As soon as the ice was thawed so as to set them at liberty, they began to move about the room, and were none the less vigorous for having slept in a bed of ice. They have been known to rise from the earth when the water was standing over them and come up through the water. When snow was upon the ground immediately around the tree, they have been known to rise from that part of the ground where there was no snow and cross over the snow to ascend the trees. The greatest natural and most destructive enemy of this insect is the *Ampelis Garrulus* of Linnaeus, called by Mr Catesby the chatterer of Carolina, and in Dr Belknap's History of New-Hampshire, *Cherry bird*. This bird destroys great numbers of them while in the larva state. Another check is a disease which may be called Deliquium, and is probably occasioned by a fermentation of their food. In this disease the whole internal structure is dissolved into a liquid, and nothing is entire but the exterior cuticle, which breaks on being touched.

The Cankerworm is spoken of in the Bible among the judgments which were to be sent upon the children of Israel; and is said to have been observed first in the southern states, where it is probably a native. It is certain that it must have spread by some means independent of itself, as the female, being destitute of wings, is forbidden to range. It may have been brought into New England by bringing trees from the southern states upon which the eggs were deposited, or brought in the larva state, into all populous parts of the United States, by falling from trees upon carriages and travellers passing under them. This conjecture is rendered probable, by its being in all places which have intercourse with such parts as are infested with it; and by its being unknown to new settlements.

There is a tradition among some of the oldest inhabitants of New England that the forest trees were destroyed very generally by this worm at one time: the precise period when this occurred I have not been able to ascertain. The night of the 17th of May 1794, was so cold as to produce ice one third of an inch thick; at that time a great part of the Cankerworms were hatched; to these the frost was so fatal that very few were seen. A person, who paid very diligent attention saw but one male the next year. I am firm in the belief that frost would not kill them at any time except when in the larva or caterpillar state.

Having given the best description of the Cankerworm that the above limits would allow, I will now proceed to describe some of the remedies or preventives. It will appear by reflecting upon the

peculiar construction and habits, that the females, being destitute of wings and under the necessity of ascending the trunks of the trees, any apparatus that would prevent them from ascending in case they laid their eggs below, would prevent the young worms from ascending. It is also obvious that this apparatus must be of a durable character, so as to be a preventive seven months in a year, as will be seen by the foregoing description, that the grubs begin to ascend in September and continue until the May following. The remedy that I shall first notice, is tarring the trunks of the trees. This, undoubtedly, would be effectual if the tree could be always kept in a proper state; but this is extremely difficult, if it is possible; a large portion of the time the tar would want renewing every day, if not twice a day. Sometimes oil or water is mixed with the tar, that it may remain softer longer. One gentleman of ample experience informed me that he lost a crop of apples by mixing oil with the tar. It appeared to render it so smooth that it did not adhere to the feet of the insects. When tar is used, and the insects are numerous, the dead bodies of those that are caught, pave a path for their successors to pass; and if a tree is tarred, and it rains upon it a few minutes, the water will glaze the tar so that the insects pass over with impunity. And they are more likely to ascend when it rains than at other times, as the water softens the ground and facilitates their escape. If but few of the grubs ascend the tree, the worms from their eggs would be liable to destroy the trees. If tar is used, it is very injurious to the trees, if applied to the bark, as it destroys the outside bark. Those who use tar and do not wish to injure their trees, put a bandage of paper or canvas around the tree, and apply the tar upon that. Some are of the opinion that if the tar was applied directly upon the bark, that it would, in time, kill the tree. Very few persons who use tar have been able to save their fruit for the first year, but they generally calculate that if they apply it closely, to destroy most of the insects in two or three years. Heaping a little sand around the trunks of the trees, so that the insects in crawling, loosen the sand with their feet, and it rolls down, carrying them down with it. When the sand is moistened with rain or dew it will not roll down; hence this remedy is almost or quite useless. If the sand keeps them down, they might lay their eggs below and the young worms would ascend over the sand, wet or dry.

Heaving the sheaves of flax around the tree, which is sometimes done, is liable to the same objections as sand, and one other is that there is so little raised that it would be hardly possible to procure sheaves.

Putting circular tin troughs around the trees and filling them with a decoction of tobacco. This was tried by George Irish, of Middletown, R. I. and found to be very expensive, as the liquor evaporated and required to be filled very often; and when it rained the water collected in them, and freezing, burst them, leaving them very leaky, and as the trees grew, they burst them and rendered them quite useless, and they were abandoned in one or two years.

Putting a square tin trough around the trees, with a roof over it, the trough to have a little cheap oil in it. This was found to answer better than any the foregoing remedies, but it is very expensive, and requires so much care, as it is necessary to make a platform of boards to support the trough, and prevent insects from ascending between the trough

and the tree. As the tree grows, it separates the platform, and the trough is required to be made larger. In making the trough larger, it is necessary to unsolder or cut it open, and put four pieces into the trough and four into the roof. And the tin, by being continually exposed to the weather, soon rusts through and becomes worthless.

I have noticed in some parts of the country, a piece of tin put round the trees, in the form of an inverted tunnel; this apparatus must have been contrived by some person who was ignorant of the entomology of the Cankerwork, as it has been ascertained by experiment that the grub, when put in a glass tumbler, will ascend the side, and if during her ascent, the tumbler is turned down and rolled over, she will adhere to the glass, and walk about upon any part of it without any apparent regard to the rolling of the glass, and appears to walk as well upon the under side of the glass as upon the top. Hence all who have used these inverted tunnels, have found them useless, or will it they continue to use them.

A circular leaden trough and roof was invented by Jonathan Dennis Jr. of Portsmouth, R. I. in 1836, and has since been patented. This trough and the roof is made of one strip of sheet lead, about three inches wide, but in the form of the top of the figure 2 inverted, with the foot cut off; thus forming a roof and trough of one strip, and then bending it round the tree so as to conform to the shape of the tree. It is made so large as to leave a space of one inch in width between the trough and the tree. The ends are then soldered together, thus forming a trough completely round the tree, with a roof over it. Three or more nails are tacked into the tree to support it, and the space between the trough and the tree is filled with seaweed, hay, straw, husks, tow, cotton waste, or any other substance that will prevent the insects from ascending between the trough and the tree, and is easily compressed by the growth of the tree. These troughs were put on to three orchards, belonging to Jonathan Dennis, of Portsmouth, R. I. father of the inventor, in the autumn of 1837, and it has proved to be the cheapest and most effectual remedy ever discovered. The three orchards contained one hundred and fifteen trees, varying in size from three inches to upwards of two feet in diameter. The expense was about 35 or 40 cents per tree. Five gallons of cheap fish oil, that cost 40 cents per gallon, was found to answer for the 115 trees for one year. A very little oil was put into the troughs the last of September. After it had remained several weeks it was stirred, and in a few weeks afterwards a little more oil was added; and from the time the oil was first put in until the first of May following there was a little oil put in twice and the oil also received two or three stirrings. Putting the oil in three times and stirring it, giving the trees all the attention necessary, was less labor and occupied less time than it would have taken to tar the trees for one week. This apparatus destroyed the insects so completely, (which for a number of years previous had been so numerous as to destroy the fruit,) that it was difficult to find one upon the trees, and the crop of apples was so large as to render it necessary to prop the trees. This apparatus has many properties to recommend it. It is more effectual, more durable and cheaper than tin troughs; it also takes less oil to fill a circular trough than it does a square one, for a tree of the same size. The packing is more easily put in, as the space is of a uniform width around the tree. It is also less liable to get out, and if the top of the

packing was daubed with a little tar, it would stick it together, taking care not to put any of the tar upon the tree or the trough, but only upon the packing. This trough will last many years without being made larger, and when the tree has grown so as to fill the space that was left between the trough and the tree, the trough can be cut open and a piece soldered in so as to make it large enough for several years more. And if the troughs are ever taken off, the lead will be worth two thirds as much as it was when it was put on. But I should not consider it safe to take it off while there were any cankerworms in the neighborhood, for they have been in some neighborhoods for the last fifty years without intermission, according to the accounts of the inhabitants. Being in conversation with an oil merchant, I inquired what kind of oil would remain longest exposed to the air without drying upon the surface, he replied that cod fish oil would never dry perceptibly, and for that reason was never used for painting, and of course would be the best to put in the above-mentioned troughs for the destruction of cankerworms.

A Lover of good Fruit and flourishing Trees.

MANURES.

Sea Weeds.—All sea-shore plants, especially those which grow below highwater mark, and which belong to the natural families of *Algæ* and *Fuci*, &c. contain more or less mineral alkali (carbonate of soda,) and have long been used as manure by the farmers in the neighborhood of the sea. They are, however, so succulent and mucilaginous, that their effects are by no means lasting; even when placed in heaps and allowed to ferment, they produce but very little heat; in fact, appear rather to dissolve away. They consist chiefly of water, mucilage, a small quantity of woody fibre, and saline matter: according to the analysis of Sir Humphrey Davy, nearly four-fifths was water, which contained no ammonia, and consequently the plants possess no acrole. When applied to land, their effects are felt almost immediately, as the mucilage dissolves as soon as the outer covering of the plants is destroyed by fermentation; but from its soluble nature, its effects are but slight, and after the first year, are no longer perceptible. The alkali they contain must also act as a chemical solvent, which will hasten their consumption. It has been proposed to collect the sea-weed and dry it by spreading it like hay, by which means, of course, nothing but water will be lost, and at the same time, the bulk will be reduced to one-fifth, in which state the author considers it to be a very valuable manure, and calculates that it can be procured and carted off at half the price of straw. This suggestion, I think, might probably be useful in some of the farming districts which are situated near the sea, but still not close enough to use the ware in its fresh state, as undoubtedly the manure is a good one as long as it lasts. The drying, also, will prevent the decomposition from taking place so rapidly as if applied when fresh.

Dry Straw of wheat, barley, and other grain crops, and spoiled hay, are always useful manures. Sir Humphrey Davy, in speaking of these adheres to the opinion which pervades the whole of his work upon Agricultural Chemistry, namely, that they should be applied fresh, and that if allowed to ferment, a large quantity of nutritious matter is lost.—*Quarterly Journal of Agriculture.*

BOSTON, WEDNESDAY, OCTOBER 9, 1859.

MIDDLESEX CATTLE SHOW.

The Middlesex Society of Husbandmen, Mechanics, and Manufacturers held their annual Show and Fair at Concord, on Wednesday last, 2d inst. The weather was highly auspicious to the celebration; and a larger collection of people were assembled than has been remembered on any similar occasion.

The exercises of the day commenced with a well-contested ploughing match, in which nineteen teams, ten with one yoke of oxen, and nine with two yoke of oxen, contended for the prizes. The ploughs used were of Tice, eight; of Wright, three; of Hitecock, four; of Prouty and Mears, two; of Ruggles and Nourse, one; of Moore, Barnet, Vt., one. We shall pass no judgment upon the different ploughs used in the case, deeming this the particular province of the committee which we would not encroach upon. But we can say with perfect truth and equal pleasure that the ploughing was very well executed, and to those, who could contrast the work done on this occasion with the style in which said work was executed twenty-five years ago, the improvement, both in the construction of the plough and the work itself will appear surprising, and evince of extraordinary improvement. There is still much room for improvement. The finishing in our ploughing is almost always bad. A skilful ploughman will turn the fast furrow as well as the first. In most cases the sod is broken to pieces, which are turned over by the hand or kicked aside by the feet, in which case the work is left in an unsightly and ragged condition. The fault lies perhaps in taking too deep a furrow, which shows the sward rather than turns it; whereas the plough should not be suffered to go so deep as before, and then the furrow slice would be completely turned.

We believe that Committees are now generally agreed not to take into consideration the shortness of the time in which the work is finished as any test of skill; and not to regard at all the time employed, unless there should be an evident indolence, and the time extended beyond all reason. This decision is right; and we wish competitors could be more impressed with it. There was some hurrying and forcing here beyond what we could have wished; but in general the teams were well managed, and the ploughing field with its nineteen teams under full sail, and cheered on by the stimulus of ambition, the hope of reward, and the interest and plaudits of the numerous spectators, who surrounded the field in a dense line, was an exhilarating and charming spectacle.

The pens were well filled with stock. Of swine, a liberal display and of superior quality. The Berkshire, and the Berkshire and the Mackay cross, by general consent carried the day. The show of milch cows was excellent, though we must again express our regret that the particular qualities and excellencies of the animals were not more fully given in the labels on the horns or in some other form. H. C. Meriam, Esq. of Tewksbury exhibited some superior improved stock of the Durham Short Horns, and so likewise did Mr Morse of Marlborough, whose young stock promises very well. Both these gentlemen have entered with much spirit into the improvement of Neat Stock, with a view to furnish for sale as good animals as can be produced; and we heartily wish them success. There was a good deal of native stock of excellent character, and a pair of half-

blood steers two or three years old, which were admirable in their appearance. The owner's name is not remembered; and in truth, the time given for examination of any part of the show, where every thing is crowded into a single short day in autumn, is insufficient to enable one to do justice to any thing.

The domestic manufactures exhibited in the hall, though not numerous, were excellent; the flannels in particular, were very superior. The vegetable products were many of them extraordinary, especially in the squash line; one of those exhibited weighed 161 lbs and was almost sufficient to last a common family three months. Whether there was any ambition in this matter to rival the great cake at the Mechanic's Fair in Boston we cannot say.

There were various samples of butter presented; and among the whole which we examined, although there was a considerable difference among the several parcels, we did not find one, which we should pronounce inferior. Most of them were excellent; and evinced great improvement in this article; an improvement which has not come too soon; and which is sure to find an ample reward. No article is better paid for where it is deserving of it; and the proximity of the Middlesex farmers to the Boston market affords all the encouragement to do their best in this matter, which they could ask.

The day upon the whole, was full of gratification to a benevolent mind, which could take pleasure in witnessing the extraordinary and cloudless prosperity of our rural and labouring population, eminently distinguished as they are for their good appearance and good manners, their improved moral condition, their general intelligence, their agricultural improvement; and that spirit of agricultural enterprise, which is waked among them, and cannot, we hope, while the winds blow and the grass grows, be again put to sleep.

The dinner was numerously attended. Several gentlemen from the neighboring towns sent some beautiful and delicious samples of peaches, pears, grapes and apples. Mr Eustis of Reading was a liberal contributor. Mr Smith, (not John) of Lincoln, sent some peaches and other fruit as handsome as any thing we desire to see. Other gentlemen gave bountifully. The occasion was one of much and innocent festivity; and the assembly were gratified and instructed by many speeches and sentiments full of good sense and sparkling with exquisite humour.

The list of premiums will be given in another place.

H. C.

OPENING OF THE WESTERN RAIL ROAD.

The first section of this great avenue of internal communication having been completed, its opening was celebrated on Thursday last, the 3d inst., by a public procession and dinner at Springfield. Several hundred guests sat down, among whom were many of the elite of the Commonwealth.

The cars with many gentlemen invited on the occasion, left Boston at seven o'clock and were set down without accident or inconvenience in Springfield at half past twelve M. This was a swallow's flight. We left Springfield the next day at half past six A. M.; spent one hour in Worcester; four and a half hours in Boston, and were in Salem the evening of the same day at one quarter before 6 o'clock, P. M. What is to come next?

It is not a great while since, when a man came from Connecticut river to Boston, the first question that would be proposed to him would be, when did you come down? what day did you leave home? and various other enquiries about uncles and aunts and cousins, which you could not answer without a feeling of uncer-

tainty and solicitude about what may have happened to them in the time which had elapsed since you left home. But now you come fresh from home, and the transition from the beautiful banks of the Connecticut to the glittering waves of Boston Bay is immediate; and you seem to dive along with a flight as rapid as the sweeping echo of the cars among the beautiful hills which line the passage. As to news, it is all over now;—and as to our blessed kith and kin in the great valley, who were once "over the hills and far away," here they are our next-door neighbors. This is delightful. What were once the golden chains of friendship have become iron; but their strength is not diminished; and use and frequency shall keep them as bright as the polished diamond.

The influence of these improved methods of intercommunication upon the agricultural interests cannot be otherwise than beneficial. When we have more room and more leisure we shall go into this subject. The first is in a degree to equalize the value of farms and produce. This has always borne a comparative relation to the vicinity of the market. The rail-road brings distant places near, and enables the farmer on the Connecticut river to avail himself of the advantages of the market of the capital and its populous vicinity, equally with the farmer much nearer to Boston. True the freight is to be paid; but this constitutes the principal difference between living ten or a hundred miles from Boston. Against this is to be set off the expenses of conveying his produce in his own wagon, the wear and tear, the injury to the articles brought, the length of time which he must spend upon the journey, and all the uncertainties of weather and roads.

We cannot now go into particulars; but let us take a single article of agricultural produce, which must be considered one of the great staples of Connecticut River Husbandry—Beef. The usual expense now of getting a fat ox from Connecticut river to Brighton market is two dollars, and about a week's hard travel and fare for the animal. The farmer, if he goes with his own stock, must ordinarily calculate upon a fortnight's absence from home, and his stage expenses on his return. The two dollars in any case must be allowed for drift, fare, and commissions of sale, though he should go with his own drove to market. This is not all. The best drovers estimate the loss of a fat ox in weight in driving from Connecticut river to Boston at one hundred pounds.

Now let us see how the rail road may operate. Suppose the market day at Brighton to be Wednesday, as it should be. Any farmer within twenty miles of the depot leaves home on Monday morning, puts his oxen on the cars on Tuesday; gets them into the market fresh, and without any loss or fatigue or fever or sore feet, on Wednesday; makes his sale the same day; gets the return of his cattle on Thursday, and is home to his farm and family on Friday, or it may be on Thursday night;—and the expense of conveying an ox to Boston on the cars ought not to exceed two dollars. No doubt suitable arrangements will soon be made by the enterprising directors. This is only one example in which substantial benefits must accrue to the agricultural interests from this rapid, safe, and comfortable mode of conveyance. We have no room at present to extend the subject.

H. C.

FINE NATIVE GRAPES.

Mr Perry, of Natick, presented us the last week with a box of delicious native grapes, which we pronounce to be very superior; to our taste as good as the Isabella. They were of a honeyed sweetness, color, pale brown. He stated that he found the vine in the woods, and finding it a superior variety, transplanted it to his garden.

The fruit was then white, but in consequence of cultivation and exposure to more light, the berries have changed to the color named. J. B.

ANOTHER STUMBLER.

Mr Perry left with us two specimens of apples, one variety a fine greening, the other a small knurly russeting, with the conviction that it is a freak of nature, as he says the tree was grafted near the ground, and this small fruit was produced on one of the small branches near the top, and that there had been no bud or graft inserted. The fact that the branch which bore the small apples was one of three that formed a fork, leads us to suppose that it must have been a graft, although we were assured to the contrary. We are told that "we must not be faithless but believing," so we may as well submit. J. B.

BRIGHTON MARKET.—MONDAY, Oct. 7, 1859

Reported for the New England Farmer

At Market, 760 Beef Cattle, 1650 Stores, 3700 Sheep and 1200 Swine.

About 250 Swine were reported last week.

PRICES.—Beef Cattle.—The prices of last week for a like quality were sustained except for the thin cattle.—We quote First quality, \$7 25 a \$7 75. Second quality, \$6 50 a \$7 00. Third quality, \$5 50 a \$6 00.

Stores.—A large number were sold but at prices less than the two preceding weeks. We noticed several lots of two year old sold at about \$20—yearlings, \$12 50. We quote Yearlings \$11 a \$13. Two Year Old \$17 a \$27. Choice heifers were peddled at a higher price.

Cows and Calves.—Sales \$30, \$35, \$42, \$47, and \$55.

Sheep.—Sales brisk, lots \$1 71, \$1 88, \$2 00, \$2 12, \$2 25, \$2 42, \$2 75, \$3 00, and \$3 25.

Swine.—One entire lot 4 for sows and 5 for barrows. Several lots at 4-1-2 and 4-3-4 for sows, and 5-1-2 and 5-3-4 for barrows. Lots of selected barrows at 6 c retail, 5 1-2 and 6 for sows, and 6 1-2 and 7 for barrows.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending October 6.

	Oct., 1859.	6 A.M.	12 M.	6 P.M.	Wind.

Tuesday,	1	36	34	37	N. W.
Wednesday,	2	39	61	55	W.
Thursday,	3	61	70	61	W.
Friday,	4	52	59	46	N. W.
Saturday,	6	31*	49	34	S. E.
Sunday,	6	28	42	42	E.

* The first frost we have had this year.

PEAR, PLUM, GRAPE VINES, & C.

1000 Pear Trees of the most approved kinds;
1000 Plum Trees of the most approved kinds and extra size—many of them have borne the past season;
600 Quince Trees;
3000 Isabella and Catawba Grape Vines, from 6 to 16 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pond's Seedling;
30,000 Giant Asparagus Roots;
6000 Wilmot's Early Rhubarb or Pie Plant, lately introduced;
Also—a good assortment of Gooseberries, Roses, &c. of different kinds;
All orders left at this office, or with the subscriber at Cambridge port, or in Mr Lybich's baggage wagon box, at Gould & Howe's, No. 8 Faenell Hall, will meet with immediate attention. SAMUEL POND,
October 9. Cambridge port, Mass.

FRUIT AND ORNAMENTAL TREES.

Morus Mallicentis, &c.

NURSERY OF WILLIAM KENRICK.

In the collection of Fruit Trees, &c., now offered for sale, as the number has been greatly augmented, so also the size of the trees generally is improved and is now superior to that of any former year. It comprises of Pears and Apples, of Peaches, of Plums and Cherries, the finest kinds, as also of Nectarines, Apricots, Quinces, Gooseberries, Raspberries, Currants; choice selections of Grape Vines, of Strawberries, &c. &c. An unusual proportion of the Pears are at this time of fine size and the collections, both of the Peach and of the Cherry trees, are believed to be unrivalled in this day, not only for fine sizes but also in the unusual and extraordinary numbers which are here ready for sale. Of all the above named species of fruits a large proportion are of the most celebrated and surpassing kinds. The abridged catalogue of Fruit and of Ornamental Trees, &c., for 1859 is ready, and will be sent to all who apply; in that catalogue the very best kinds of fruits, so far as proved, are particularly designated by a star.

100,000 MORUS MALICENTIS Trees of any other reasonable quantity or cuttings of the same, are now offered for sale. The trees are genuine, all being raised by the subscriber, either at his Nursery here, or at his Southern Establishment at Portsmouth in Lower Virginia. Also the E. Asia, Canton, the Moretti or Alpine, the Broussa and some other Mulberries.

Ornamental Trees and Shrubs, Roses, Honey-suckles, Premias and Double Dalaias, &c. &c., Cockspar Thorns, and Buck Thorns for hedges.

All orders addressed to the subscriber, post paid, shall be promptly attended to and all trees when so ordered will be securely packed for safe transportation to distant places.

WILLIAM KENRICK.

Nonantum Hill, Newton, Mass. Oct. 9.

GARDEN SEEDS.

The subscribers are now receiving their full supply of Garden, Field and Grass Seeds, and would respectively recommend to their customers to send in their orders as early as possible to secure a supply from their choicest lots. Their stock of seeds for this season will be very full and complete, and most of the varieties being raised under their own inspection they can confidently recommend them as being fresh and genuine. Among them are Long Blood, Early Turnip and Sugar Beets; Ruta Baga, Mangel Wurzel, Orange Carrot, Radish. Cucumber and Cabbage of sorts. Also, Peas, Beans and Squashes, which together with a large supply of most kinds of seed desirable for the field or garden, comprise the most complete and extensive assortment of seeds to be found at any similar establishment in the country.

(OSCEOLA) BRECK & CO.

Oct. 9. N. E. Agri. Warehouse and Seed Store.

HOUSE IN DORCHESTER.

To let a large and convenient house, pleasantly situated in Dorchester, one third of a mile beyond Dr Codman's meeting house, and between five and six miles from Boston; together with 1½ acres of fine land, well stocked with fruit trees. There are good wells of water—a fine barn, chaise house, and corn barn, and convenient out buildings. The above affords a rare chance to some practical person wishing to carry on a farm; possession given immediately. Apply at this office.

October 9.

BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells.

Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

A FARMER WANTED.

A man and wife or a single man are wanted to carry on a Farm about 14 miles from Boston, for which reasonable wages will be paid. None need apply but Americans and those that are acquainted with Farming and Gardening. First rate recommendations will be required for honesty and sobriety. Please apply at this office.

September 25.

Complete Garden and Horticultural Tool Chests, from Sheffield, England; containing Garden Shears, Improvers Pruning Shears and Scissors, Pruning and Grafting Knives, Flower Gatherer, Garden, Dutch and Triangular Hoes, Saw, Spud, Weeding Hook, Garden Rake, Trowel Hammer and Garden Reel; comprising every useful implement necessary for the cultivation of the Flower Garden. For sale at the New England Agricultural Warehouse, No. 51 and 62 North Market Street.

BERKSHIRE BOAR.

For sale, a fine Berkshire Boar, 9 months old, and large of his age, bred in Albany, from imported stock. The pedigree will be furnished at the time of sale. Price \$50. Apply to Messrs. J. BRECK & CO.

September 1/53.

We do not know where we should go to find any thing of the kind, more descriptive, more beautiful, more playful, prettier, sweeter, than the following from the gifted pen of Mrs Sigourney.

THE BIRDS IN AUTUMN.

BY MRS SIGOURNEY.

November came on with an eye severe,
And his stormy language is hoarse to hear—
And the glittering garland of brown and red
Which he wreath'd for a while round the forest's head,
With sudden anger he rent away,
And all was cheerless, and bare, and gray.

There the houseless grasshopper told his woes,
And the humming bird set forth a wail for the rose;
And the spider, that weaver of cunning so deep,
Roll'd himself up like a ball to sleep;
And the cricket his merry horn laid by,
On the siph, with the pipe of the dragon fly.

Soon voices were heard at the morning prime,
Consulting of flight to a warmer clime:
"Let us go! let us go!" said the bright win'g jay—
And his gay spouse sang from a rocking spray,
"I'm tired to death of this hum-drum tree,
I'll go—if 'tis only the world to see."

"Will you go?" asked the robin, "my only love?"
And a tender strain from the leafless grove
Responded—"Wherever your lot is cast,
'Mid summer skies or the northern blast,
I am still at your side, you heart to cheer,
Thouge dear is our nest in this thicket here."

The oriole told, with a flashing eye,
How his little one shrank from the frosty sky—
How his mate with an ague had shaken the bed,
And lost her fine voice by a cold in her head—
And their oldest daughter, an invalid grown,
No health in this terrible climate had known.

"I am ready to go," said the plump young wren,
"From the hateful home of these northern men;
My throat is sore, and my feet are blue—
I'm afraid I have caught the consumption too;
And then I've no confidence left, I own,
In the doctors out of the southern zone."

Then up went the thrush, with a trumpet call;
And the martins came forth from their box on the wall,
And the owl peeped from his secret bower,
And the swallows convened on the old church tower;
And the council of blackbirds was long and loud—
Chattering and flying from tree to cloud.

"The dahlia is dead on her throne," said they;
"And we saw the butterfly cold as clay;
Not a berry is found on the russet plains—
Not a kernel of ripen'd maize remains—
Every worm was hid—shall we longer stay,
To be wasted with famine? Away!—away!"

But what a strange clamor on elm and oak,
From a bevy of brown coated mocking birds broke!
The theme of each separate speaker they told,
In a shrill report, with such mimicry hold,
That the eloquent orators stared to hear,
Their own true echo, so wild and clear.

Then tribute after tribute, with its leaders fair,
Swept off thro' the fathomless depths of air—
Who maketh their course to the tropics bright?
Who nreveth their wing for its weary flight?
Who guideth their caravan's trackless way,
By the star at night, and the cloud by day?

Some spread o'er the waters a daring wing,
To the isles of the southern sea to sing;
Or where the minaret towering high,
Pierces the gold of the western sky;
Or amid the harem's haunts of fear,
Their lodges to build, and their durslings to rear.

The Indian fig with its arching screen,
Welcomes them in to its vistas green;
And the breathing buds of the spicy tree,
Thrill at the burst of their revelry;
And the bulbul starts 'mid his carol clear,
Such a rushing of stranger-wings to hear.

O wild wood wanderers! how far away
From your rural homes in our vales ye stray!
But when they are waked by the touch of Spring,
We shall see you again, with your glancing wing—
Your nest 'mid our household trees to raise,
And stir our hearts in our Maker's praise.

A GOOD HIT.—The following from the Iowa Sun is deserving the attention of every one of our readers; the concluding item is quite important, and rounds the period well:—

"Internal Improvements."—The system we plead for, though attended with much toil and expense, will not require a state tax of a single cent, nor much, if any legislation. It is pre-eminently a "democratic" system; it is to be begun by the people, and will be for the exclusive benefit of the people.

It is only for every farmer to mend up his fences, till his ground well, have it well prepared for planting, have the crops in seasonably, tend them well, keep down the weeds, see that his horses and cattle are fed and treated so as to make them thrive, keep his implements in order and in their place; for every father to rule his family well, govern his children, form their minds and manners by good instruction, train them up in the habits of industry, honesty, and sobriety, provide them with comfortable clothing, send them to school, pay for their tuition and have a care to the company they keep; for every husband to treat his wife as a bosom companion—for every woman to love her husband, and to prove a help meet for him, to keep from gossiping, to spin more stocking than street yarn, to keep the house tidy, and the family clothing clean and well mended;—for every damsel to keep all grease spots from her clothes, darn the heels of her stockings, remove beau catchers from her head, and novels from her library, to do much with needles, and store her head with useful ideas; for every young man to go decent, but to buy no better clothes than he can honestly pay for, work hard, behave courteously to others, especially to old men, to guard against self-importance and insolence, if much in company with ladies, to black his shoes, trim his hair, throw away his segar and quid, attend preaching regularly, and hold his tongue if he cannot talk sensibly, and to get married when he is twenty five, if he can find any one to have him, for magistrates to execute the laws; for tavern-keepers to keep better food than brandy; for towns to have clean streets and good sidewalks, to remove

every nuisance, and every thing injurious to health; favor good morals; for every district to support good schools. In fine, for it is impossible to enumerate all the objects embraced in our scheme, for every body to cease to do evil, learn to do well, attend church on the Sabbath, mind his own business, and take a newspaper.

A Young Man Wanted on a Farm.

The advertiser is in want of a smart young man that is well acquainted with the cultivation of vegetables, and one that is also capable of taking charge of horses, cows and swine, one that understands it, he must be energetic, active and fond of neatness and order; he must produce evidences of a good moral character. Such a person may find a permanent situation by calling on Messrs BRICK & CO. None need apply but such as answer to the above.
September 25. 1851

WINSHIP'S BRIGHTON NURSERIES,

AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.
Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed, and forwarded to any part of this or other countries.
April 10.

Morus Multicaulis Trees on Seed.

The subscriber offers for sale 10,000 trees produced from seed of the genuine Morus Multicaulis. The seed was raised on his premises in 1835; the trees have been multiplied for the two last years by layers, their growth is more rapid than the original tree, and appear to be sufficiently acclimated to endure the winter, some of them having been left standing in the open field unprotected during the two last winters without any essential injury. The leaves are very large and equal in quality to any other kind for feeding the silk worm. Those who are wishing to purchase a superior kind of Mulberry are requested to call and examine for themselves, before the foliage is destroyed by frost
CALVIN HASKELL.

Harvard, September 11.

MULBERRY TREES.

The subscriber has on hand a quantity of Mulberry Trees of a quality which is probably superior to any kind ever introduced into this country. They were imported four years since, and though they have sustained the rigorous cold of the last three winters entirely unprotected, yet it is believed a Southern or Western climate would be more admirably adapted to their growth and propagation. Their foliage is most luxuriant and affords more nourishment than any other variety. Silk produced by worms fed with the leaves, has been pronounced by judges to be the best ever manufactured by them, and decidedly superior to the best Italian. A few thousand will be for sale if immediate application is made to the subscriber, where specimens may be seen.

Also—a few hundred Morus Multicaulis and Asiatic.
JOHN N. BARBOUR,
September 11. No. 30 Commercial Street, Boston.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:—

1. So great a reduction in the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS,
17 SCHOOL STREET. BOSTON

N. E. FARMER.

[For the New England Farmer.]

New York, 21st Sept., 1839.

Str—The New York Urate and Poudrette Co., finding that gentlemen who had purchased their manures had been experimenting with the articles, some advisedly and others mistakenly, it became desirable for many reasons to learn—

1—On what particular grains or garden vegetables the manure was used, the quantity applied, and the result:

2—To know the precise manner and result of each trial:

3—How the urate and poudrette compare with other manures in their effect: and

4—Generally, whether it was not desirable to the farmer and gardener to have the contents of sinks and privies made into *odororous* manures.

In answer to their circular sent to Mr Linn, of Schenectady, they have received a letter of so interesting a character, that we ask the publication of it at as early a day as your arrangements and convenience will permit.

Amended instructions, the result of information received, will be published in a few days for *gratis* distribution among those who have or may wish to use the manures.

(COPY.)

Schenectady, Sept. 19, 1839.

The New York Urate and Poudrette Company:

GENTLEMEN—In answer to your "circular," I would say, that I obtained from your company a barrel of poudrette last spring, intending to test its value as a manure, by a few close and accurate experiments. It came to hand, however, so late in the season, that I was unable to apply it as I intended, or to arrive at results which would in all respects prove the value of the substance as a manure, or the best modes of applying it. I applied it to a variety of vegetables in my garden, and also to a small portion of a field of corn of about five acres, at my farm in the vicinity of this city. The vegetables in my garden have grown with unusual richness and luxuriance, and have most evidently felt the effects of the application. Of the results at my farm I can speak more satisfactorily, because here I can compare the portion which *has*, with another portion of the same crop, in the same field, which *has not* received the poudrette. This crop upon a strong, rich soil, which had been slightly manured in the hill from the fold-yard at the time of planting. At the first hoeing, and when the plants by reason of the unfavorable season were extremely backward, I directed my farmer to apply to corner of the field where the crop was the least promising, a handful of poudrette to each hill, covering it at the same time with a thin coat of earth. This was faithfully done until the poudrette was consumed. The remainder of the field received, a part, the usual dressing of *plaster*, and a part, of *ashes*.—The plants to which the poudrette was applied, were the first to change color—throwing off

the sickly, yellow hue, and adopting a deep green. At the period of the second hoeing, the same plants retained not only the appearance of better health, but had obtained greater vigor and more size than any others of the same crop. They have held the same distinction throughout the season; and it is now plainly visible, although the entire crop is a fair one, that when we come to harvest, we shall gather a greater weight of stalks and more grain from the portion where this manure was applied, than from the same space at any other point in the field.—We have certainly no experience proving that the same results could have been reasonably expected from the application of any other of the various manures in common use.

With us, plaster has long been considered the grand restorative for this crop, and ashes, with many farmers, almost a specific; and indeed that both substances are very useful as manures on most varieties of soil, is universally conceded. Mills to grind plaster for manuring purposes, are as common throughout this part of the country as those devoted to grain; and I have seen boats loaded with leached ashes, toiling their way from the far west, in order to enrich farms on Long Island.

In this experiment, poudrette was applied side by side with plaster and ashes, under circumstances in favor of the latter, and yet they have most indisputably yielded the palm to the former: and all this is not without reason. *Heat and moisture* are the sources of vegetation: poudrette, if it have it not in itself, will generate more heat and for a longer period, than either plaster or ashes, and will absorb and retain more moisture. It seems, also, to decompose inanimate vegetable substances in the soil with which it is mixed, and so to diffuse and incorporate itself with the soil as to change its color around the plant to which it is applied. Like most other manures, (only more sensibly and rapidly,) it imparts of its qualities to every substance with which it comes in contact, and by the aid of its own and borrowed heat and moisture, assimilates all to itself, and thus exercises, although applied in most inconsiderable quantities, a certain and immediate influence on vegetation.

I regret that I did not receive the article so as to apply it at the time of planting. I am not sure that the results would have been more successful, and except for the purposes of experiment, I should be content to use it hereafter on most crops, as I have done this season.

Decicated manures have long been appreciated in Europe. There, one ton of them have been estimated to be equal in fertilising properties to thirty-six tons of barn-yard manure. At this rate, there is a large balance on the score of economy in favor of the former: and when it is remembered that the manures as prepared by your company, are wholly odororous, and may be conveyed in barrels to the most remote parts of the country as commodiously as flour, and at a trifling expense, our agriculturalists should be moved by every consideration connected with cleanliness, rural economy, the productiveness of the soil, and the right use of the means which Providence places before them as in-

citements to industry, to promote the use of substances, which, left undisturbed, are worse than useless—scattering in our large cities and towns disease and death, and which, when submitted to your *alchemy*, spreads health and verdure, and blesses and rewards both citizen and husbandman.

I shall be pleased to receive your "improved instructions" for using the manures, of which you speak, and to know at how early a day this fall I may order a few barrels for future experiments.

Very respectfully, yours, &c.

A. L. LINN.

The following is a copy of the improved instructions alluded to in the foregoing:

MANURES.

The attention of the public has recently been directed to the use of Urate and Poudrette. It has long been known in France as the most efficacious of all manures, and the experiments made during the past and the present year, viz: 1838 and 1839, in the use of Poudrette in the Northern and Eastern States, but more especially in and around the city of New York, have awakened the attention of both farmers and gardeners. The Royal Academy of Agriculture in England, have caused experiments to be made of the respective power of the different manures, and upon trials so made, it appears beyond a doubt that manure made from sinks and privies, is superior to any other productive agent for agricultural purposes. As it is necessary to add, that it is worse than labor lost, to cultivate worn out or poor soils without the use of manure? He who expects to be liberally rewarded for his labor must give liberally what nature requires. The wise man has said, "he that watereth shall be watered also himself."

AMENDED DIRECTIONS.

Directions for their use were given by Peter Barthelemy, (who was one of the first discoverers in France of the present system of preparing the articles,) how and in what manner they should be applied, and who recently introduced their manufacture in the city of New York. Many of the persons who have used the articles, have found from practical experiments, that the former directions may be amended advantageously, and it is doubtless the case that many new methods may be discovered, which it is hoped will be communicated for public benefit.

Urate is the product of the *liquid* part, and Poudrette of the *substantial* part of the sinks or privies, both of them reduced by a different process, to a dry and odororous substance, and used as the best of all manures known to agriculturalists and horticulturalists, being an animal manure of the richest and purest kind, and the most powerful of any application that can be made to the earth.

Urate.—The urate may be used in its dry state by spreading it on the land as you would lime or ashes, or, after having been dissolved in water, may be used through a watering pot, or by a cask on

*The company have several thousand bushels for sale at the present time.

For all kinds of small grains, such as wheat, rye, oats, barley, flax, and others of the like kind, it may be sowed dry upon the soil, in the proportion of 12 to 15 bushels per acre, according to the quality of the land, and then harrowed in.

For corn and potatoes, and such like, it is best to mix the urate in an equal quantity of dry soil, and put in the hill about a gill or handful, sprinkled around the seed corn and potatoes as is usually done with ashes.

For beets, turnips, or other vegetables sowed or planted in drill, the urate is to be prepared in like manner and sowed in the drill.

For grape vines, fruit trees, flowering trees, flowers, also for garden vegetables, such as cauliflower, cabbage, melons, cucumbers and the like, urate may be dissolved in water, in the proportion of one pound to a gallon of water, and poured on the subject; one application is sufficient; and for articles not herein enumerated, it may be sowed dry on the surface of the ground.

Where the land retains water during the winter, urate must be used only in the spring, in order that its salts may not be absorbed in too large a quantity of water.

Where the land is dry or does not retain water during the winter, urate may be used in the autumn—if, however, the sowing takes place shortly before the hard frosts, it is better to use urate only in the beginning of spring.

As a general rule, more urate is required upon the same quantity and quality of land in autumn than in the spring; if used in the spring, it is better to apply the urate in a damp day, or immediately after a heavy rain, if it cannot be applied shortly before the rain, as it is a light substance, liable to be blown from off the land by high winds.

There is a great advantage in soaking corn, oats, and all other grains for twelve hours only, in a solution of urate, prepared as above directed, before planting or sowing it, and then rolled in lime or plaster, the corn or grain will start sooner, be stronger, and less liable to attack by worms or birds; but care should be taken not to suffer it to remain longer than about twelve hours in the solution, else you might destroy the germinating quality of the grain. It has also been found beneficial to soak timothy and clover seed in urate or poudrrette for about four to six hours, and then rolled in lime or plaster, the seed comes up better and grows stronger than other seed sown at the same time in the same field.

Poudrrette.—Poudrrette is not dissolved in water before being used as is urate, but is to be used in a dry state, or by mixing it with dry soil in hills or drills, or sown in broad cast on the land, as you would lime or ashes. Experiments in this country, thus far, have proved the following methods as the most advisable in its application:

For Corn.—After the furrows have been struck, sprinkle in the pace where the hill is to be, before planting, a handful of poudrrette, equal to about a gill, then deposit the corn, (double that quantity of poudrrette has destroyed corn and burned it up,) then cover up the corn and press the earth down over it with the foot or hoe.

For Potatoes.—The same quantity, namely a handful or gill, may be used very advantageously; and it has so happened, that when the quantity was increased nearly double, no injury resulted, but rather improved the potatoes: a large handful, however, is sufficient.

any thing out of my own experience, and that they operate on the other manures until those manures are consumed, before they are beneficial to plants; and in some instances it may be, that the result of the use of the urate and poudrrette in the first year of their first application, will not be as satisfactory to the farmer as he will think he had a right to expect:—this arises from the fact that the land contains a considerable quantity of some former manure upon which urate and poudrrette will first act;—at the very next season, however, the farmer will find a crop far superior to his expectation, provided he will put no new manure of any description to the land lately manured with urate or poudrrette.

This, however, must be further explained by saying, that it applies to manure placed or dunged in the hill, or where the land is in a high state of cultivation, from having been highly manured in broad cast, which would give the poudrrette an opportunity of feeding upon or consuming it. Experience has proved, this year, that where there was a moderate application of lime, or barnyard manure applied to the land in broad cast, it did not appear to affect the influence of the poudrrette on the crop.

The quantity of poudrrette must vary from 15 to 35 bushels per acre according to the quality of the land, and the crop cultivated: less than 15 bushels to the acre may not be very satisfactory, and more than 35 is useless.

On Long Island, the following has been adopted by a practical farmer with success. For wheat, he used to apply 20 wagon loads of 30 bushels each, equal to 600 bushels of horse manure, which cost him \$20, besides carting 20 loads. He now applies 40 bushels of poudrrette which cost him \$16, and can carry more than sufficient for one acre in a load.

For rye, 450 bushels of horse manure, and now 25 bushels of poudrrette.

For oats, 350 bushels of horse manure, and now 20 of poudrrette.

For buckwheat, 200 bushels of horse manure, and now 15 of poudrrette.

Indian corn, one gill in the hill.

Urate and poudrrette are light substances, and liable to be blown off the ground by high winds, if sowed on the surface when the ground is not damp; therefore, it is considered best to sow the grain and harrow the land once, and then sow the manure in broad cast and cross harrow the land the second time.

The difference of the season between spring and autumn, and the state of the atmosphere, are to be considered before using either urate or poudrrette; damp weather is always to be preferred. Neither of them contain any seed of weeds of any description. An application of 35 bushels to the acre of urate or poudrrette once in every three years is sufficient.

Urate and poudrrette may be sent to any part of the country in barrels or bags—barrels are to be preferred when it is liable to get wet. Orders may be given, post paid, directed to "The New York Urate and Poudrrette Company," box No. 1211, post office, New York.

The urate and poudrrette made by this company, is not confined to distribution among its stockholders only, and therefore farmers and gardeners may expect a supply in the order in which their application is made, without any condition of becoming

to the use of urate and poudrrette, as it is feared it may be brought into disrepute by other manufacturers of the articles, who are ignorant of the true method of preparing it, and where quantity rather than quality is considered most desirable.

It may be that on trials of urate and poudrrette, different application may be found more desirable in such case it is hoped the experimenter will make known to the public his discovery, either by letter addressed to the company, or through the medium of agricultural newspapers. This company have been erecting a large establishment at Lodi, on the Hackensack river, in the county of Bergen, at State of New Jersey, to manufacture urate and poudrrette.

Applicants living in New Jersey, may always be supplied by calling at the factory, which is near the bridge over the Hackensack river, belonging to the New Jersey Railroad and Transportation Company. There will also be a depot for the article New York and at Brooklyn, where applicants can always be supplied.

Testimony of the use and value of urate and poudrrette, will be found, now and hereafter, on reference to the Cultivator, New England Farmer, and other agricultural papers, from letters or certificates held by the company; the substance of some of such as have been already received, is comprised in the following statement, and of others, have been sent to the papers for publication:

1. George Walton, of the city of New York, gardener, upwards of 56 years of age, and a gardener from his youth, certifies that in the spring 1837, he planted four young grape vines in a yard in the city of New York,—that in the summer 1838, he applied two quarts of poudrrette to such vines;—the earth was removed from round the roots and the poudrrette applied to the roots and then covered over again with the earth;—they soon began to grow very rapidly. In the year 1839 there was applied, at three different times, about two quarts each time;—the vines have grown very rapidly, and all, except one, which died down the root in the winter, have a large quantity of fruit, such as he never witnessed before, and attributes it to the use of the poudrrette.—(See Cultivator.)

2. Benjamin Latin Wood, of the town of Poughkeepsie, certifies that he made a solution of the poudrrette, and soaked his oats in it six hours,—sowed his oats three weeks later than the usual time, and reaped them only one week later than his neighbors, and his crop was first rate. He planted two rows of the common bush bean, on the 20th of May, in hills, and put one gill of poudrrette to each hill, and before the 26th of August following, he had had four crops of beans from his bushes. (See Cultivator.) They continued to blossom and yield, so that before the middle of September he had two additional crops of beans.

3. William H. Wright, of Poughkeepsie, farmer, certifies that he made several experiments with the urate and poudrrette. (See Cultivator.)—He soaked corn, part in a solution of urate, and part in a solution of poudrrette, about 12 hours, according to printed directions, which was planted, and some corn was planted without being soaked; there was a decided benefit in all that was soaked over the other. On other hills of corn, and on potatoes about a gill of poudrrette was applied to each hill

and the effect was quick and powerful, and he says he has never applied any other manure that can be compared with it in its beneficial results;—the potatoes were superior to any he ever saw, both in quality and quantity, and at least two weeks earlier than common. He soaked also roots about 12 hours and some not so long—the result was the same as applied to the corn—superior to that not soaked, and in the same condition. He soaked timothy clover seed a few hours in poudrrette, and rolled in lime,—same beneficial result; and he recommends the manures as the best he ever tried.

The corn above referred to was planted from the 10th of May to the first week in June, some with poudrrette in the hill and some without any, but here lime and barnyard manure had been put in road cast on the land; in three weeks after planting, the poudrrette corn was as large again as that which no poudrrette had been put, ripened from two to three weeks earlier in the field than it did in the garden, where there was no poudrrette, but here manure had been applied. On the 18th of August, the corn from the field was too old to eat, the dinner table as green corn, and it is believed that corn manured with about one gill of poudrrette in the hill, without any other manure, will ripen in our coldest summers, sufficiently early to make an entire crop. The Mercer potatoes ripened two weeks earlier, and were finer and larger in the month of August, than any other potato.

All persons who have made a fair trial of these manures, unite in making the following summary so far as has come to the knowledge of the manufacturers, that is to say—

That the corn, grain and other vegetables sowed and planted in land manured with urate or poudrrette, ripen up quicker, stronger, and of a dark green color, and grew with great rapidity, and promise an increase in yield over any other, not manured with these manures, and the crops ripen from one to two weeks earlier, and the Long Island farmers say it is the cheapest and best manure they can procure.

Morus Multicaulis.—From information received, a gill of poudrrette applied to the roots of a young tree, made bare, and then covered up with earth, produced a most powerful effect in its growth and foliage. It does not answer so well to sow it broad cast, as some persons have done, over the land. With trees or vines, the manure must come in immediate contact with the roots.

Peach trees fall and die from two causes—1st, from overbearing;—and 2nd, they are killed by the grub worm, which enters the body of the tree just at the surface of the earth. To remedy these evils, it is believed that if you will bare the roots of the tree for some 12 to 20 inches, and in immediate contact with the roots about two parts of poudrrette in the month of May, and the same quantity in September, and cover the earth over it again, it will replenish the exhaustion created by overbearing. At the same periods of time, cut close around the body of the tree at the surface two quarts of urate, and cover the same with earth, and give it one watering, the effluvia from the urate, being of the nature and strength of the spirits of turpentine, it is believed no worms can exist near it, tobacco leaves wrapped around the body of the tree, have been found a complete remedy against the grub.

Further Testimony.—Dr Granville, in his report to the Thames Improvement Company, in speaking

of the immense source of agricultural wealth which the sewers of London afford, but which is now worse than lost, makes the following statement of facts furnished by them.

If a given quantity of land sown, and without manure, yields three times the seed employed, then the same quantity of land will produce 5 times the quantity sown, when manured with old herbage, putrid grass or leaves, garden stuff, &c.: 7 times when manured with cow dung; 9 times with pigeon's dung; 10 times with horse dung; 12 times with urine; 12 times with goat's dung; 12 times with sheep's dung; and 14 times with night soil; (night soil is the same as pondrette and is sometimes called Flemish manure,) or bullock's blood. Or, in other words, an acre of land sown with two bushels of wheat, without manures, will produce 6 bushels; 10 bushels with vegetable manures; 14 bushels with cow dung; 18 bushels with pigeon's dung; 20 bushels with horse dung; 24 bushels with goat's dung; 24 bushels with urine; 24 bushels with sheep's dung; 28 bushels with night soil, or bullock's blood. But if the land be of such quality as to produce, without manure 5 times the sown quantity, then the horse dung will yield 14, and the night soil 19-23 the sown quantity; or land that will yield without manure 10 bushels an acre, manured with horse dung will produce 28, and with night soil about 39 bushels of wheat per acre.

These results and multitudes of recorded experiments prove, that they in no case vary far from the facts, show the immense superiority of night soil or Flemish manure, over any hitherto employed. In addition, Dr Granville found that some crops which yield large profits are so extensively cultivated, in both Flanders, can only be obtained in abundance and of the finest quality, by employing what may emphatically be termed Flemish manure, in the preparation of the soil.

Another important matter in the comparative value of the manures, and of essential practical interest to the farmer, has been established by the same authoritative investigations; and that is, that while night soil has produced fourteen times the quantity sown, where the horse dung has yielded only ten—the proportion of the former, or Flemish manure, was to the horse dung employed, only as 1 to 5: so that with one ton of Flemish, a larger produce was obtained than with five tons of the best stable manure.

CAPONS.

One of our subscribers, a few weeks since, wished to be informed respecting the art of making capons. As we were not acquainted ourselves with the process, and having no work at hand treating upon the subject, we have delayed answering until the present time. The following article from "Dickson on Poultry," was furnished by a friend.

We think when our correspondent becomes acquainted with the cruel and barbarous operation, he will be satisfied to let his chickens alone, and suffer them to enjoy their brief existence without interruption, until the day they are doomed to submit to the poulterer's knife. However gratifying the capon may be to the appetite of the epicure, the thought of the anguish which the fowl had endured in the process, would to us, be a draw back upon the gratification. We do not believe the operation can be performed without giving pain, although we are assured to the contrary. J. B.

"If cocks, when young, are emasculated, so as

to take away their natural reproductive feelings, it has a prodigious effect upon their condition; and a similar effect may be produced upon young hens by an operation on their egg organs. The art of making capons has been practised from the earliest antiquity in Greece, India and China, for the purpose of improving the flesh of birds for the table, in tenderness, juiciness, and flavor.

Chinese Mode of making Capons.—The Chinese, who are very expert in the art of making capons, use the following method. The wings of the fowl being folded back till they meet, the left foot of the operator is placed on them, the fowl being laid on its left side: the great toe of the right foot is placed on its legs: the feathers are then plucked off by the side—an incision, about an inch in length, commencing about an inch from the back-bone and extending obliquely downwards, is made with a knife, the cutting part of which is bevelled to a point, like a dissecting scalpel. This incision is carefully carried through the skin, muscles, and membranes, till the intestines are laid bare, while flat blunt hooks are put into the incision, which is extended and kept open by the elasticity of a bamboo, or whalebone: the intestines are then pushed aside with a pair of forceps, which are used to lay hold of the stone when it is by this means brought into view, while there is passed over it, through a bamboo or elder tube, a horse hair, which is drawn backwards and forwards through the tube till the spermatie cord is cut through, and the stone is then scooped out. The other stone is removed in the same manner. No blood issues from the spermatie cords, nor does the animal seem to feel pain. The hooks are then removed, the wound is closed, the feathers which have been plucked off are stuck upon the wound with the blood, and the wing being put down on it, the animal walks off as if nothing had happened. Young cocks three months old, are made choice of for the operation, which must if possible, be performed before July, as it has been remarked that capons made later than this never prove fine."—*Dickson on Poultry.*

SILK MANUFACTURING.—One reason why we have such an unshaken confidence in the ability of this country to enter successfully into the culture of silk, its manufacture as well as its production, is found in the superior enterprise, industry and ingenuity of our citizens over those of an part of the world. Great Britain thought to prevent the establishment of the cotton manufacture in this and other countries, by prohibiting, under severe penalties, the exportation of machinery or patterns for its construction. New England mahinists went to work, built shops, made their own patterns, and produced specimens of machinery much superior in action and principle to European models, that we at once obtained the preference in their own market, and now annually export large quantities of machinery to order. So it is ready with machinery for the manufacture of silk. In reeling, and now in weaving the narrow kinds of silk, such as laces, ribbons, and other goods of that description, we have already made great advances on the clumsy and ill-arranged implements of the old world.—Such improvements at the outset, leave no room for doubt, but that when the attention of our artisans shall be directed to the manufacture of silk machinery, we shall soon find our improved processes amply to compensate for any supposed difference in the price of labor.—*Genesee Farmer.*

The usual festival of this Society was held at its Hall, 23 Tremont Row, on the 25th, 26th and 27th September. The beauty of our autumn and the absence of frost, conspired to render the offerings of Flora, Pomona and Tellus peculiarly attractive. Young and various palms, new flowers and fine specimens of green house plants were happily introduced on the stands. Great credit is due to the society and to the liberality of contributors, in thus rendering its exhibition so attractive to the public eye.

Plants in Pots.—From Hon. John Lowell; *Araucaria excelsa*, *Crinum amabile*, *Musa sapientum*, *Stapelia reflexa*, *Previana coccinea*, *Musa purpurea*.

From Mrs Bigelow, Medford; *Agave Americana*, var. *Striata*, *Yucca gloriosa*.

From Wm. E. Carter, Botanic Garden, Cambridge; *Eugenia australis*, *Magnolia grandiflora*, *Calostemma saligna*, *Daphne odora variegata*, *Erica baccaea*, *Polygala cordifolia* ? *Melaleuca tenuifolia*, *Viburnum odoratissimum*, *Asclepias nivea*, *Protea grandiflora*, *Protea speciosa nigra*, *Magnolia purpurea*, *Jasminum azoricum*, *Fuschia stricta*, *Pittosporum tobicum*, *Magnolia anontofolia*, *Laurus nobilis plena*, *Ilex*, sp; *Hedychium Gardenium*, *Verberna incisa*, *Melaleuca ericatifolia*, *Pittosporum undulatum*, *Fuschia globosa*, *Laurus nobilis*, *Rhododendron hybridum*, *Ficus australis*, *Pelargonium zonale* var. *variegatum*, *Aspidium exaltatum*, *Azalea phoenicea*, *Ilex cordifolia*, *Myrtus communis*, *Rosmarinus officinalis*, *Viburnum tinus*, *Canna esculenta*, *Laurus excelsa*, *Acacia decipiens*, *Protea* sp., *Phlox argentea*, *Hibiscus* sp., *Oxalis Bowenii*, *Phlox Drummondii*, *Olea fragrans*, *Licium Floridanum*, *Canella Japonica*—two seedling varieties.

From Messrs Hovey & Co.; *Epiphyllum Ackermanii*, *Gardioquia Hookerii*, *Oxalis Bowellii*.

From J. P. Cushing, Watertown; *Cycas revoluta*, *Stapelia variegata*, *Lantana borbonica*, *Calathea zebrina*, *Plumix dactylifera*.

From John Towne, Snow Hill; *Manettia cordifolia*, *Stapelia hirsuta*, *Erica abietina*, (two plants), *Menziesia caerulea*, *Erica mammosa*, *E. reginaeanus*, *E. gracilis*, *Pylicia ericoides*, *Crowea saligna*.

From Public Garden, Boston; *Cassia*, sp., *Plumbago Capensis*, *Pandanus* sp., *Vinca rosea*, *V. alba*.

From Messrs Winship, Brighton; *Vinca rosea*, *Hydrangea hortensis*, *Acacia* sp., *Cistus Laurifolia*, *Agapanthus umbellata*, *Achrostichum alceiorum*, *Eugenia australis*, *Hibiscus Rosasinensis*, *Begonia argyrostigma*, *Aloe upomaria*, *Erica spuria*, *Justicia lutea*, *Acacia suaveolens*, *Ancuba Japonica*, *Salvia splendens*, *Fuschia occinea*, *Lobelia speciosa*, *Lantana carnea* ? *Stapelia variegata*, *Roses*, varieties, *Pelargoniums*, do. *Ponias*.

From William Mejer, Roxbury; *Lantana Camara*, *Acacia armata*, *Ilex variegata*, *Gentiana Japonica*, *Thuya occidentalis*, *Hammantus coccineus*, *Ulex Europaeus*, *Myrtus* sp., (two specimens), *Pittosporum undulatum*, *Eugenia myrtifolia*, *Amaranthus hypochondriacus*, *Pelargonium*, var. *Prince's Perfection*.

From Thomas Mason, East Boston; *Erica blanda*, *E. cruenta*, *E. multiflora*, *E. gracilis*, *E. castra*, *E. arborea*, *Diosma thymifolia*, *D. capitata*, *Melaleuca saligna*, *M. sp.*, *Acacia longifolia*, *Verberna Tweediana*, &c. &c.

From Samuel Sweetser, Cambridgeport; several *Dahlias*, one of which was *D. Striata formosissima*,

albilos, *C. cortex*, *Opuntia aurea*, *Echinocactus multiplex*, *Anuryllis crocea*, &c.

From J. J. Low, Roxbury; *Cycas revoluta*, *Anarullis Belladonna*, (three pots), *Hammantus coccineus*, one superb *Tea tree* rose.

From John P. Priest; *Myrtus communis* (large), From J. L. L. F. Warren, Brighton; *Ilex opaca* and *I. variegata*, *Correa alba*, *Begonia argyrostigma*, *Salvia fulgens*, *Verberna citriodora*, *Fig tree* with second crop of fruit; another specimen; *Melanthus major*, *Portulacca arborea*, *Ancuba Japonica*.

From Parker Barnes, Boston; *Polianthus tuberosa*, fl. pl.

From N. N. Dyer, South Abington; *Begonia Evansiana*.

Cut Flowers and Bouquets.—From Col. Perkins, Brookline; two flowers of *Strelitzia augusta*, of ivory whiteness and delicacy—very rare.

From Messrs Hovey & Co.; a small stand of *Verbenas*, containing the following varieties: *Verberna chamedrifolia*, *V. chamedrifolia major*, *V. Tweediana*, *V. Tweediana superba*, *V. Arriana*, *V. Eyriana*, *V. incisa*, *V. Binneyana*, *V. venosa*, *V. tencuoides*—also, great variety of German *Asters*.

From Messrs Breck & Co.; nine superb *Bouquets*, containing fine *phloxes*; *Zinnia violacea*, of several varieties; *Elichrysium bracteatum*, varieties, and *Celosia cristata*.

From William E. Carter, Botanic Garden, Cambridge; five *Bouquets*; specimens of *Magnolia glauca*, (a second flowering), *Silphium elatum*, from Carolina, &c. &c.

From Mr Leland, Charlestown; fine cockscombs.

From A. H. Waters, Millbury, by his gardener, J. Sheridan; fine cockscombs.

From William Kenrick, Newton; two baskets of flowers, tastefully arranged, &c. &c.

From S. R. Johnson, Charlestown; superb varieties of *Tea*, *Noisette* and other *Roses*, *Asters*, &c.

From D. M. McIntyre, Cambridgeport; *Salpiglossis*—three elegant striped varieties—*Asters*, &c.

From Messrs Winships, Brighton; superb and finely arranged *Bouquets*.

From Thomas Mason, Charlestown; several *Bouquets*.

From J. S. Ellery, Woodland, Brookline—by James Irish; two large bouquets of *Dahlias*, intermingled with other flowers, and a beautiful pyramid—all got up with uncommon good taste and much novelty of style.

Groups of *Dahlias*, of great merit, were offered by Messrs Johnson, Wilder, Carter, Walker, Hovey & Co., Stickney, Breck & others. The *comp d'ord* of these was most striking and vivid. Very many were of the newest style: some most rare, some bizarre in aspect, some lovely, some gorgeous. We hope to give a perfect catalogue of the varieties and of all the contributors in the forthcoming reports of the society, (second series). We do not vouch for entire correctness in the above brief account, but offer it in haste, and according to our best abilities under such circumstances.

We cannot refrain from saying a word on the style of arrangement, which we consider peculiarly fortunate. The grouping of such varieties of plants as would be offered at a promiscuous display, is no easy task. To combine elegance with use, to show off a fine plant to the best advantage, is very requisite to its picturesque effect. This we are happy to say, was well done. The broad foliage of the

Erica, were arranged in much beauty. Wreaths of flowers, of airy lightness relieved the upper surface of the walls and gave a finish to the whole.

The influence of such exhibitions cannot be too highly estimated. To snatch a glimpse of the beautiful and delicate in nature, portrayed in a flower—to behold the magic effect of mind over these objects of matter, in producing the most novel results—to commune with the spirit of excellence, harmony, and of exquisite perfection in the outward world—to breathe the odor of the loveliest forms of organization—to transport one's self to Eden's groves, amid the din of ceaseless worldly toil—this is sufficient to give new zest to life and allay the feverish excitement of too sedulous care. Nor is it merely to gaze on simple beauty, to breathe the perfume of roses and jessamines, to admire and wonder—but in the rearing of the simplest flower, or in the production of the most common vegetable, there is in operation a train of physiological laws, subservient to the human energies alone, most complex in their mode and yet most obedient to the master spirit who dares to control. Studies the most profound and effects the most important and enduring, are involved in the taste for such pursuits as these.

JOHN LEWIS RUSSELL,

Chairman of the Committee on Flowers.

Sept. 28, 1839.

FRUITS.

From J. P. Cushing, by Mr Haggerston; splendid *Grapes*—Muscat of Alexandria, Black Hamburg, Muscat of Larell, Morocco, St. Peters; striped St Germain (Panache), *Pears*—unique as to size, form and general appearance,—altogether superior to others heretofore exhibited under the same name, and much admired by those who noticed them. Also, Burgmansbirne pear, a new variety, of great promise, and St. Michael's, do., very large and beautiful. Neither of these were at maturity. We should decline the name of the last, coming from most other sources, and still think it will prove a brown *Berre*.

From Hon. T. H. Perkins; *Grapes*—Black Hamburg, St. Peters, Frankendale, Muscat of Alexandria, Muscat, Frontignac, Chasselas of Fontainebleau, Reine de Nice, (unripe but very large,) Sweet water, Grizzly Frontignac,—also, three kinds of Peaches and two kinds of Nectarines—all very beautiful.

From Joseph Balch, Jamaica Plains; *Duchess d'Angouleme Pears*; *Pumpkin Sweeting Apples*; *Black Hamburg*, *Blanquette*, *White Muscat*, *Black Prince*, variety from France, name unknown, (great bearer), *Muenier*, and *Chasselas Grapes*—the two latter in open culture.

From Frederic Tudor, Nahant; fruit of the finest kind from trees planted on the exposed situation of that promontory, as follows: *Madame*, *Julienne*, *Buffum*, *Wilkinson* and *Bleeker's Meadow Pears*; fine variety of *Peach*, name unknown.

From J. B. Jones, Dorchester; fine *Freestone Peaches*, and *Old Higginson do.*—Very good.

From S. Downer, Dorchester; *Apples*—*Pumpkin Sweeting*, *Nonsuch*, *Gardner Sweeting*, *Fall Harvey*, *Roxbury Russett*, *Wales apple*, *Golden Russett*, *Seaver Sweeting*, *Rhode Island Greening*, *Ribstone Pippin*, *Esopus Spitzenberg*, *Ramshorn*, *Hawthorndean*, *Lyscom*, *Pearmain*, and one basket of a variety, name unknown. *Pears*—*Andrews*, *Beurre Diel*, *Passé Colmar*, *Seckel*, *Cushing*, *Monsieur Jean*, *Heathcote*, *Urbaniste*, *Fulton*, *Roi de*

Wirttemberg, Black pear of Worcester, Harvard, Catilac—all very excellent.

From R. Manning, Salem; Pears—sixty-five varieties—Bezi Vaet, Henri IV., Doyenne Louis, Beurre Bose, Bergamot d'automne, Farelle, Burgomaster of Lond. Hort. Soc., Stryian, Bullum, Capsheaf, Louis Bonne of Jersey, Alpha, Figue de Naples, Newtown Virgaleuse, Glout Moreau, Bezi de la Motte, Chamontelle, Fourcroy, Angouleme, Passe Colmar, Bartlett, Chelmsford, Belle Lucrative, Beurre P Aremberg, Beurre Van Marum, Winter Orange, Frederic d' Wirttemberg, Beurre Bronze, Haddon's Incomparable, Bon Parent, Pope's Quaker, Naumkeag, Long green, Bleecker's Meadow, Seckel, Verte Longue, Wilkinson, Harvard, Echassarie, Beurre du Val, Beurre Dewez, Unknown Bergamot, Burgomaster (of Boston,) Bartram, Belle et Bonne, Napoleon, Josephine, Jalouise, Ronscheuch, Winter Nels, Endicot, Catilac, Fondante de Bois, (of Loudon Hort. Soc.) Black Worcester, Cumberland, Beurre Diel, Easter beurre, Marie Louise, Prince's St. Germain, Rousselet de Rheims, Surpasse Virgaleuse, Autumn Bergamot, Beurre Scutin, Old Orange pear. Apples—Gravestine, Brabant, Bellflower, Lyscom apple, Dauvers Wintersweet, Fall Harvey, Peanock's Winter, Bellflower (of Cox), fruit of Double-flowering Chinese. A large part of this presentation was excellent; a small portion only at maturity.

From J. M. Ives, Salem; Pears—Bezi Montigny, Brown Beurre, Andrew's Gilegiz? Beurre d' Aremberg, Duchess d'Angouleme, Michaux, Passe Colmar, St. Michael, Capiaumont, Wilkinson, Buffum, Glout Moreau, Striped St. Germain, Raymond, Bleecker's Meadow, Lewis, Josephine, double flowering, Easter Beurre, French pear, (name unknown)—many of these quite handsome. Apples—Michael Henry, Campfield or Newark Sweeting.—Plums—Cruger's Seedling, Blue Imperatrice.

From M. P. Wilder; Pears—Capiaumont, Beurre d' Aremberg, Heathcote, Verte Longue, Belle de Bruxelles, Columbian Virgaleuse, Bergamotte de Paques, Colmar Epineux, Seckel, Easter Beurre, Long Green, Bezi de Montigny, Louis Bon de Jersey, Passe Colmar, Cushing, Duchesse d' Angouleme, Beurre Diel, Glout Moreau, Bleecker's Meadow, Burgomaster (of Boston.) Plums—Blue Imperatrice; Orange Quinces; Rock Melons—all very fine.

From the garden of M. P. Sawyer, Portland; fine peaches.

From James Dodd, Boston; very large and beautiful Seedling Peaches.

From Otis Johnson, Lynn; Pears—Passe Colmar, Burgomaster, (of Boston,) Louise Bonne de Jersey, Catilac, Julienne, Washington, Sucre Vert, Admiral, Buffum, Long Green of Autumn, Doyenne d'Isis, Verte Longue Panaech, Ronsette de Rheims, Kouslette d'Panache—an admirable lot. Grapes: Black Hamburg, White Muscat of Alexandria, Zinndal, White Chasselas—equal to any.

From Mr Sharp, Dorchester; Seedling Peach. From Samuel Pond; Pears—Andrews.

From T. Mason, Charlestown; Grapes—Isabella, Sweet Water.

From J. Fisher, Brookline; Pears—Seckel, Bartlett, Andrews.

From Perrin May, Washington st. Boston; Brown Beurre Pears—the finest, both for size and beauty.

From J. Newhall, Lynnfield; three kinds Seedling Peaches; Isabella and Sweet Water Grapes.

From R. Ward, Roxbury; Bartlett and Seckel Pears; Old Mixon and Franklin Peaches.

From W. Worthington, Dorchester; Seedling Pear—very first rate, melting and like the Bartlett.

From Charles Johnson, Weston; Seckel Pears; Petre apple and Hawthornean apple.

From Robert Milne, Portland; three specimens of splendid Peaches.

From S. Sweetser; Pears—Seckel, Fulton, and two other varieties.

From J. J. Low, Roxbury; Apples—Calville, Minister, Mela Carla. Pears—Johnnot, Long Green, Urbaniste, Napoleon, Marie Louise, Fulton, Yellow Winter, Lewis, Beurre de Roi, Capiaumont, Wilder. Plums—Blue Damson and an unknown variety. Peaches—President, Melacaton and Coolidge.

From S. R. Johnson; Grapes—Black Hamburg.

From H. Van Dine, Cambridgeport; Cox's Gold-endorp Plums.

From C. & A. J. Downing, Newburg N. Y.; Pears—Brown Beurre, St. Michael and Seckel—worthy of the society's best thanks.

From J. Wilson; Peaches—two specimens. From W. Oliver, Dorchester; Pears—Urbaniste, Wilkinson, Ambrette, Echasserie, Seckel, Bartlett. Peaches—President, Grapes—two baskets of Golden Chasselas (open culture.)

From W. Meller, Roxbury; Plums; Peaches: Black Hamburg Grapes; Chasselas Grapes, of outdoor culture.

From Messrs Hills, of West Cambridge; a very large basket of splendid Peaches and a pair of beautiful Water-melons.

From J. S. Ellery, Brookline; Grapes—Black Hamburg, Miller's Burgundy and Chasselas.

From Henry Rice, Boston; Brown Beurre Pears—very fine.

From Dr Z. B. Adams, Boston; Pears—St. Michael, Seckel both very beautiful.

From J. B. Jones, Dorchester; Apples offered to be named.

From E. M. Richards; Apples—White Calville, Fall Sopsavin, Dutch Collin, Wine, Lyscom, Porter, Pomme d'Api, Pie, Cogswell, Shop and Red Greening. Pears—Jalouise, Duchess d'Angouleme, Summer Thorn, Seckel, Capsheaf, and other sorts. Peaches—two varieties of Seedling Clingstone and others. Orange Quinces. All these fruits from Mr R. were of the best kinds.

From E. Vose, President of the society; Pears—Lewis, Seckel, Iron, Heathcote, Bartlett, Napoleon, Urbaniste. Apples—Gravestine and Hawthornean. Peaches—Washington Clingstone, Catherine do. and Welles' Freestone. Melons—Rock, Persian, Minorca, and Cantaloupe. Grapes—Chasselas, of open culture: the lot as beautiful as in former years.

From Harrison Gray, Roxbury; two baskets of Black Hamburg and St. Petre's Grapes.

From Joshua Gardner, Dorchester; Pears—Andrews, Seckel. Apples—Spitzenberg and Fall Pippins.

From General Sumner, Roxbury; Raspberries—Red Antwerp? second crop.

From A. D. Williams, Roxbury; Pears—Andrews, Seckel. Apples—Hubbardston Nonsuch, Yellow do., Horn. Black Hamburg Grapes and Plums.

From Thomas Mason, Charlestown Vineyard; Black Hamburg and Purple Constantia Grapes.

From George Newhall, Dorchester; Bellflower Apples. Moore's Rareripe Peaches, and two varieties of Seedling Peaches. Black Worcester Pears—all excellent.

From John A. Kenrick, Newton; Apples—Roxbury Russets, Baldwin, Blenheim, Pippin, Hubbardston Nonsuch. Pears—Beurre Knox, Buffum, Black Pear of Worcester, or Iron. Peaches—Robinson Crusoe, No. 1, Heathcote.

From R. Dean, Medford; One basket of Peaches. One dozen of Apples.

From Samuel Train, of Medford; Peaches.

From T. Hooper, Marblehead; Bilboa Pears, from the original tree, and very superior.

From garden of Mr Murphy, Philadelphia; by Wm. Kenrick, fruit of *Maclura aurantiaca*. (Osage orange.)

From Jonathan French, of Dorchester; Six baskets of Pears, Apples and Peaches, mostly without names.

From B. P. Chamberlain, of Salem; One basket Epine D'Ete Pears.

B. L. Oliver, Malden, Snow Peaches.

J. L. L. Warren, of Brighton; Apples—Porter, Roxbury and Garden Russets, R. I. Greenings, Monstrous Pippin, James' Greening, Baldwin, River and Lady. Pears—Bartlett or Williams good Christian, Buffum, Seckel, Urbaniste and Napoleon. Peaches—Lemon Clingstone, Malacaton, Pearl, George 4th, and 2 Seedlings. Melons—Netted Cantaloupe. Figs—Mostly superior and all quite good.

Mr Plympton, Boston; St. Michaels—1 basket large, fine and beautiful. Isabella Grapes, well ripened and handsome, open culture.

James Arnold, New Bedford, by Mr Emerson; Black Hamburg Grapes and Peaches—both very superior.

Col. Wilder, of Dorchester, from Jos. Rinz, Jr. a corresponding member of the Society at Frankfurt sur le Maine, (Germany.) Fruits in Wax—This presentation is a wonderful imitation of Fruit well known to most of our members, whose applause with that of numerous beholders, was given with acclamation. We can fancy nothing of the kind more perfect.

The fruits of this exhibition were judged to be very fine and abundant, considering the unfavorable nature of the past season. As a display they certainly appeared to great advantage on the tables of the Hall, and attracted universal notice. We do not venture on any comparisons or critical opinions, regarding this subject, reserving whatever there may be of that nature to another and more fitting opportunity. The diffusion of the best of fruits and the adaptedness to different parts of our state, are encouragement; to the farther efforts of all patrons of pomology.

J. L. R.

Vegetables. From Jona. French, Dorchester; (Rose Monte Estate) 9 Squashes weighing 158 pounds, 1 Valparaiso Squash, 60 do.; 1 Marrow 36 do.; 1 Pumpkin, 31 do.; 8 Rohan Potatoes, 7 do.; eighty pounds of Rohau were produced from 6 lbs. of seed; 5 beets, weighin: 21 pounds; 6 Carrots, 5 1-2 do.

From Charles R. Lowell; Solanum Melongena; (Egg Plant) three varieties, viz. Long purple, Round purple and White.

From John M. Ives; Autumnal Marrow Squash; Rohan Potatoes.

From E. Hersey Derby; 1 Pumpkin, (from seed brought from Indiana,) weighing 109 lbs.

From R. Ward, Roxbury; Lima Beans

From J. J. Low, Roxbury; Three Egg Plants.

From Harrison Gray, Roxbury; Squashes.

From Wm. Meller, Roxbury; Cucumbers.

From A. D. Williams, Roxbury; Brocoli, Beets,

very large.
From Geo. Newhall, Dorchester; Tomatoes.

From B. Lincoln, Jamaica Plains; Marrow Squash.

From Messrs. Hovey & Co.; Fine plant of *Morus Multicaulis*.

From Dr. Briggs, Dedham; Ear of Rice Corn, (curious.)

From Samuel Blake, South Boston; 8 bush weighing 115 lbs. of the Valparaiso family, well shaped and handsome.

From J. L. F. Warren, Brighton; Squashes, 21 varieties, Marrow, Crook-Necked, Winter, &c.; Pumpkins, 7 years; Potatoes, Rohan; Tomatoes, Yellow and Scarlet; Beans, Lima, Horticultural, &c.; Gourds.

From W. H. Raplton, New-York; Great Celery.

From Hon. Mr. Lowell, Roxbury, Rohan Potatoes. Perhaps nothing equal to this specimen has been seen this season; certainly none have met the eye of the Committee of superior quality. It is a subject of regret that they were offered at so late a period.
J. L. R.

HORTICULTURAL EXHIBITION.

The city has presented the last week objects of strong interest in its Horticultural Exhibition and Mechanics' Fair. In speaking of them it is difficult to know where to begin or where to end; what to say, or how to express or how to define the feelings and sentiments which have made our temples throb almost to bursting, and our hearts ache with the intensity of admiring and delightful excitement. Who has not many a time felt that there is no language adequate or fitting to express some emotions of the soul; that the boldest epithets and superlatives are soon exhausted without uttering at all the feelings which swell in the heart, or presenting in any true images the perceptions of transcendent beauty, skill, or achievement, which fill the imagination. Now we are precisely in this predicament; and we know that there are hundreds and thousands who enter into our condition with entire sympathy.

But we must say something, and the Horticultural Exhibition claims our first notice. The Massachusetts Horticultural Society is now about ten years old. It was formed by a combination of a few gentlemen in Boston and its vicinity who were disposed to encourage the cultivation of fine fruits, and the introduction of rare and beautiful plants and flowers for utility and embellishment. It had its origin in a highly cultivated and refined taste; and in the most generous and wisely directed public spirit; and it has effected much more of good than the most sanguine could have anticipated. It has been in the first place the means of establishing the cemetery at Mount Auburn. It connected this at first with its plan of a botanical garden; and though the cemetery has now passed out of its control, yet to the projectors of the Horticultural Society, and especially to its first president, than whom no man among us has ever been more distinguished for his intelligence and public spirit, are the community indebted for this beautiful establishment; an establishment suited to awaken and cherish the best feelings of our nature; which has been and must continue to be a most delightful and improving place of public resort; and a source of inexpressible consolation to those to whom it is peopled by the most endearing and precious objects of recollection; an establishment which has done more to improve and elevate the moral taste of society

ever.
It has been the means in the second place of introducing among us and of bringing into notice and diffusing far and wide, many of the most valuable and delicious fruits and vegetables. In this respect it has come powerfully in aid of the agricultural societies; and from directing its attention to these particular objects, it has acted with more efficiency in this matter than they could ever have done. In order to see what has been accomplished it is only necessary to go to their annual or attend their weekly exhibitions; and observe the variety, the beauty, and the excellence of the productions, which they show.

In the next place it has introduced and encouraged a taste for rural embellishments, which has made the most remarkable progress and produced the most charming and beautiful results in the vicinity of the capital, and is daily extending itself into the interior to every part of the state. A quarter of a century ago and you might have travelled from one end of the state to the other, and have scarcely found at the farm-houses ten good kitchen gardens, well stored with abundance and variety; and much less any particular attention bestowed on the cultivation of fine fruits; and as to flowers, to have found in a garden a princess' feather, a sweet-william, a marigold, and a sunflower, and about the house perhaps a few broken earthen pots or old bottles with the necks knocked off, with here and there a monthly rose, a geranium, or a myrtle stuck in them, would have been to have found a rare instance of aristocratic luxury; and we should at once have been disposed to enquire what person lived there, whose tastes and habits were so different from the rest of the world.

But what a revolution has been effected; and all this we confidently assert has been done mainly by the efforts made and the impulse given by the Massachusetts Horticultural Society. Every where this taste for rural embellishments is extending itself. Green houses and conservatories are becoming not uncommon appendages to the rural residence. The piazzas are trellised with honeysuckles, and trumpet flowers and bignonia; the front yards and gardens are laid out with the refinements of order and taste, and stocked with all the varieties of floral beauty from a pansy to a dahlia; and the windows even in the depth of winter are brilliant and enchanting with their show of splendid exotics; their japonicas, their daphnes, their monthly roses, their geraniums, their lilies, and the other nameless and exquisite beauties, which figure in the floral dance.

But what is the use; or what is the profit of all these flowers. Why pay so much attention to mere embellishment? Why cultivate things which are merely to be looked at and which minister to the gratification of the sense of sight only? We answer at once; why not gratify the sight? Are not the pleasures of the sight among the most innocent and the most delicious that the senses can meet in? Are they not far less likely to corrupt us than the pleasures of the taste? Did not God make the eye to see with; and has he not crowded this world, the whole universe, the sky, the earth, the water, the air, with images and forms of exquisite and imitable beauty? Has not all this been made for the gratification and delight of those who have senses to perceive and enjoy it? It is the duty of man to indulge, to cultivate, to quicken, to exalt and enlarge this taste; to search out and multiply the forms of beauty. These

to make the little spot of earth which God permits him for awhile to appropriate to himself, and to make his dwelling place, as beautiful as nature or art can render it, he not only provides for himself pure, innocent, lasting sources of pleasure, of which he may drink to the fill without satiety, disgust or intoxication; but he becomes in no mean sense a liberal benefactor to the community; and to generations which shall come after him.

But there are higher uses than these; there are the highest moral and religious uses to be found by the reflecting mind in such cultivation and such exhibitions as these. In the cultivation of these varied and beautiful products man acquires a new consciousness of power. As this consciousness is strengthened his self-respect is increased, and the value of his existence and the sense of his moral responsibility are heightened and deepened.

In contemplating the perfection of beauty which these fruits and flowers exhibit, how can he help being impressed with the strongest admiration for the Being whose skill designed and formed them. In considering in how many ways they minister to his pleasure and comfort, in a form so cheap that every one can have access to it, and in a manner so universal that there can be no monopoly or exclusion, how can his heart, if he has a heart, fail to be deeply touched with the goodness of God. The great and divine teacher bade his followers to reflect upon the flowers of the field how they grow, and with what brilliancy and gorgeousness are they apparelled; and if any one can have looked round the room of the Horticultural exhibition, and have found himself moved by no religious consideration, have felt no thoughts of the Creator flitting across his mind, and no sentiments of grateful adoration stirring within his heart, he may well have some doubts of his own humanity.

We have left to ourselves little room to speak of the exhibition itself. This will be done in full and in detail by the Committees themselves. We believe the display of fruits and flowers has never been excelled here. We should like to particularize, but it would be vain to attempt it. The peaches, the pears, the apples, the grapes, the plums, the melons were numerous in variety, beautiful in appearance, and delicious in quality. The show of dahlias was extremely numerous and variegated. But we must stop, and we will finish with a remarkable and encouraging fact, stated to us by one of the principal contributors to this splendid show. Six years ago he purchased his place without any fruit upon it; and now he has nearly two hundred different kinds of pears upon it, and other fruits and flowers without number or measure. The great varieties of pears and fruits which he exhibited are all the work of that time. Who will say he is too old to begin? Who, if he cannot work for himself, is not willing to do something for those who shall come after him, and secure to himself the blessings of a grateful posterity. But in regard to all human plans and enterprises of good, cast your bread upon the waters and remember the great rule, "what thou doest, do quickly."
H. C.

Agricultural Concordium.—Why is a Boston man asking for a debt like a particular breed of English cattle?

Answer.—Because he is a *Suffolk* dun.—[*Com.*]

The wheat crop of Michigan is estimated this year at 6,700,000 bushels.

MR. EDITOR.—During my residence abroad, I spent one summer and a part of the autumn at Merton, in Surrey, domiciled with a Mr Raine, tenant to Mr Middleton, author of the Agricultural Survey of Middlesex, with whom I was acquainted. It was a hay and grass farm, and the management of it was of the best description. It consisted of 160 acres, all improved as meadow, no plough being used on the place except in the garden. The course adopted was as follows.

Early in the spring the fields were all shut up. As soon as the hay was secured, and this was a great labour, the teams commenced carrying it to London for sale, *loading back with manure*. And now commenced that course of judicious conduct which excited my warmest admiration at the time, and has remained my head ideal of good management ever since. The second growth of grass being well shot up, Mr Raine went to the cattle fair, and bought large beeves, in high condition. In his rich and clean meadows, these were soon ready for Smithfield market, to which they were sent, and their place supplied by other beeves, still in high condition, but of much smaller size. On the removal to the stambles of the second herd, still smaller cattle in fair condition, were bought to be initiated into a still higher preparatory degree of fitting. These were sold off, and were succeeded by small lean cattle from the Welsh mountains, to be improved as stores. The fifth set of temporary tenants of the farm were small sheep, to be wintered.

The farm, as I have remarked, consisted of 160 acres. The rent paid was £2 10s per acre, at \$4,80 the pound sterling. Twelve dollars per acre, £1,920 for the farm. Paying this enormous rent,—saddled with heavy taxes, and at a large outlay for manure, and farm servants, Mr Raine was still accumulating large riches upon it. His house was in the style of a gentleman, and his expenditures on a most liberal scale, but he owed nobody a farthing.

We are poor farmers in this country, Mr Colman, very poor farmers, as Alfred Jingle would say, very. Those of us who do best, are very far from doing as English farmers do. They make more profit per acre from the *borders of their fields* than we make from our best interval; realize as much gain in the shifting stock to consume the herbage of a single summer, as we do from growing for three years the same number of head. Every thing there is made to produce profit. As large a capital is invested as we invest in a thrifty commercial business. No man can rent a farm who has not a sufficient capital to stock it, work it, and lay out of the price of a year's harvest. The outlay of capital on a large farm is very great. A fair estimate of the required sum on a farm of a thousand acres, is five thousand pounds sterling. It would astonish the American farmer to see the book of "bills receivable and payable" of an English lessee of a farm.

Yours,
J. A. I.

From the Farmer's Cabinet.

BROOM CORN CULTURE IN SALEM, N. J.

Your letter of the 20th July was received on the following day, asking information respecting the cultivation of broom corn, and the quantity raised

on my land per acre. In answer thereto, I say that my land is a loamy soil, and in good condition, producing generally about sixty bushels of Indian corn per acre—of wheat, from twenty to thirty—and of barley from thirty to fifty.

My usual method is to cart out all my manure from the barn-yard through the winter and early in the spring, so that the greater part thereof is upon the fields by the time the plough can be put into the land. The cultivation of the broom-corn by Mr Brown, (the paper you say heretofore sent to you being lost, giving an account thereof) and by him attended to until the brooms manufactured by him were sent to market, amounted according to his estimate furnished me, to \$96 50. While in conversation with him, he drew from his pocket a paper containing the following words:—“Was raised on eight acres of land, the property of Robert G. Johnson, broom corn that made four hundred dozen of brooms, which weighed one and a quarter pound each. Many of the stalks measured sixteen feet six inches in length, and produced four hundred and thirty bushels of seed.

ISRAEL E. BROWN.”

I would observe that I commonly mature my land at the rate of from thirty to forty loads per acre—such was the dressing the land got previous to the planting of the broom corn. The land being in high tilth, produced, from careful attention, a most luxuriant crop of stalks; I think they must have averaged from fourteen to sixteen feet in height throughout the whole field. I have not been inclined to encourage the rearing of broom corn more than a sufficiency for family use. I consider the broom corn a much more exhausting crop to the soil than any other grain. There appears to be an oleaginous quality peculiar to it, and somewhat analogous to flax seed, which in my judgment has a tendency to produce the impoverishment of the soil. The seed makes excellent food for hogs and cattle.

Its nutritious quality may easily be discovered from the fine colour and taste which it imparts to butter from the cows which are fed on it. The best way to use the grain is to grind it with a portion of oats—say about one third of oats to two thirds of the seed. Indeed it is so hard and flinty, that it should always be ground before feeding it to any kind of stock.

Good broom corn seed weighs about fifty pounds to the bushel. Its value compared to oats may be considered as about half as much again; so that should the market price of oats be, say twentyfive cents per bushel, the broom corn seed would be worth thirtyseven and a half cents.

BROOMS.

I think there is a difference of twentyfive, if not thirty per cent. in the quality of brooms sent to market from such as I generally use in my family. I always endeavor to procure from the manufacturer, and for which I pay him an extra price, such as are made from the stalks before the seed ripens on them. A broom made from such tops will last much longer than one made from the ripe bush. But the peculiar excellency of the broom consists in its fibres being more soft and elastic, and performing the act of brushing or sweeping, similar to the brush made of bristles, without injuring the carpet if used prudently. After the broom shall have been used in sweeping the parlor, and the finer parts worn away, it will then be as good to sweep the other parts of the house, as the best new

broom made from the ripe corn. Ladies who set so deservedly such a high value upon their beautiful Turkey and Brussels carpets, should purchase none other than such as are made from the unripe bush. The broom made from such may be easily known by the colour of the straw, which is that of tea or sage; the fibre or straw is much finer and of a softer feel than that of the broom made from the ripe corn—the colour of which is red, or inclining to red. Yours very respectfully,

ROBERT G. JOHNSON.

From the Franklin Farmer.

SAVING CLOVER SEED.

The difficulties of saving the seed are imaginary; the process is simple and easy. After the clover field has been cut or grazed, let the second come on. When about two-thirds of the heads have turned brown, cut with a cradle, throwing the grass into double swaths, and cure. When cured, rake up in the morning while the dew is on, into convenient parcels for loading with a pitchfork, and, as soon as all danger from heating is obviated, get it under shelter, either in the barn, or protected in the field. Be careful not to put it away while any moisture remains in the plants; and on the other hand, don't handle it rudely when very dry, where you don't want the seeds to fall, for in that condition the heads spend freely. Having sheltered it, you may wait, if you choose, till winter affords leisure for thrashing or trading out. Sow in the chaff, as it is more certain than the cleansed seed. A bushel in the chaff will abundantly seed an acre; but we would advise the mixture of blue grass, timothy and orchard grass with it. We shall say more of sowing, however, at more seasonable date.

The second crop produces more seed than the first, and hence the economy of the first cutting or grazing the field; though from that cut for hay, a prudent, careful husbandman might easily save enough seed for his own use. It is believed that more seed may be saved by mowing when about two thirds of the heads have turned brown than at any other period, because, if cut sooner, too many seeds are unripe, and if later, too many shatter out of the heads in cradling and handling. If the heads break off and fall through the fingers in cradling, cover with cotton or linen cloth. Every farmer may easily save his own seed.

THE FARRIER. *Try before you buy.*—If you meet with a horse you like, and are desirous of buying him, do not fall in love with him before you ride him, for though he may be handsome, he may start or stumble.

To discover a stumblers.—If you go to buy of one that knows you, it is not unreasonable to desire to ride him for an hour. If refused, you may suspect he has some faults; if not, mount him at the door of the stable where he stands; let him neither feel your spurs, nor see your whip; mount him easily, and when seated, go gently off with a loose rein, which will make him careless; and if he is a stumbler, he will discover himself presently, especially if the road in which you ride him be any thing rough.

The best horse indeed may stumble (a young one of spirit, if not properly broken in, will frequently; and yet if he moves nimbly upon the bit, dividing his legs true, he may become a very good saddle horse,) I say, may stumble; but if he springs out, when he stumbles, as if he feared your whip or spur, depend upon it he is an old offender.

THE FARMER.

A farmer's life is the life for me,
I own I love it dearly:
And every season full of glee,
I take its labors cheerily—
To plough or sow
To reap or mow,
Or in the barn to thrash, sir—
All's one to me,
I plainly see
" 'T will bring me health and cash, sir."

The lawyer leads a harass'd life,
Much like (that of) a hunted otter,
And 'tween his own and other's strife,
He's always in hot water—
For a foe or friend,
A cause defend,
However wrong must be, sir—
In reason's spite,
Maintain 't is right—
And dearly earn his fee, sir.

The doctor's styled a gentleman,
But this I hold but homing;
For, like a tavern waiting man,
To every call "he's coming"—
Now here, now there,
Must he repair,
Or starve, sir, by denying;
Like death himself,
Unhappy elf,
He lives by other's dying.

A farmer's life, then, let me live,
Obtaining while I lead it,
Enough for self, and some to give,
To such poor souls as need it.
I'll drain and fence,
Nor grudge expense,
To give my land good dressing—
I'll plough and sow,
Or drill in row,
And hope from Heaven a blessing.

WILLIAM PENN'S WAY

OF GETTING WHAT LAND HE WANTED.

PENN learned in 1683 that there was some very choice land not included in his first purchase; and he sent to enquire of the Indians, if they would sell it. They replied that they did not wish to part with the land where their fathers were resting; but, to please their father Onas,—the name they gave the good man,—they would sell him some of it. Accordingly, they agreed for a certain quantity of English goods, to sell as much land as one of his young men could walk round in a day, "beginning at the great river Cosquanco," now Kensington, "and ending at the great river Kallapigo," now Bristol. This mode of measurement, though their own choice, did not in the end satisfy the Indians; for the young Englishman, chosen to walk off the tract of land, walked so fast and far as greatly to astonish and mortify them. The governor observed this dissatisfaction, and asked the cause. "The walker cheat us."

in this way?"
"True," replied the Indians, "but white brother made too big walk."

Some of Penn's commissioners, waxing warm, said the bargain was a fair one, and insisted that the Indians ought to abide by it, and if not, should be compelled to it.

"Compelled!" exclaimed Penn, "how can you compel them without bloodshed? Don't you see this looks to murder?" Then turning with a benignant smile to the Indians, he said, "Well, brothers, if you have given us too much land for the goods first agreed on, how much more will satisfy you?"

This proposal gratified them; and they mentioned the quantity of cloth, and number of fish hoods, with which they would be satisfied. These were cheerfully given; and the Indians, shaking hands with Penn, went away smiling.

After they were gone, the governor, looking round on his friends, exclaimed, "O how sweet and cheap a thing is charity! Some of you spoke just now, of compelling these poor creatures to stick to their bargain, that is, in plain English to fight and kill them, and all about a little piece of land!"—*Adv. of Peace.*

THE SWEDISH ARMY. Samuel Laing, Esq. has lately published an interesting tour in Sweden. In speaking of a company of soldiers that he met at Westeraus, he says, "Their evening parade upon the street before the door struck me very much. After the roll was called and the reports and orders delivered, the commanding officer called one of the soldiers out of the ranks, it appeared to me without turn or selection, and the whole company taking off their caps at once the man repeated the Lord's Prayer, after which they all sang a hymn very beautifully, and the parade was dismissed. This morning early, about two o'clock, the company mustered before the door again to march to their next halting place before the heat of the day set in. Between sleeping and waking, I heard the same service repeated,—the Lord's Prayer and a morning hymn sung, before they marched off. The service was not hurried over. It lasted from fifteen to twenty minutes, and was gone through as slowly and solemnly as in any religious meeting. This is a remnant of the military practice of the great Gustavus Adolphus."

PURSUIT OF KNOWLEDGE UNDER DIFFICULTIES.

"So his knowledge almost always been cultivated and genius nurtured,—that is to say, amidst difficulties. Where did Franklin first cultivate the knowledge that at length bore him to the heights of fame? In a printing office. Where did Bowditch study the mathematics? In early life, on ship-board, and ever after in hours snatched from the cares of a busy life. How did Ferguson begin to study astronomy? Tending sheep in Scotland; lying on his back upon the bare earth, and gazing upon the heavens,—mapping out the constellations by means of a simple string stretched from hand to hand, with beads upon it, which, sliding back and forth, enabled him to ascertain the relative distances of the stars. Where did young Faraday commence his studies,—still young, and yet the successor in London to the celebrated Davy? He began his chemical studies, a poor boy, in an apothecary's shop. Sir Richard Arkwright, who was knighted

is one of the latest in England, was a blacksmith when he was thirty years old. And at this moment, there is a man in New England who has read fifty languages, who was apprenticed,—who has always worked,—and who still works,—as a blacksmith!" [Christian Examiner.]

"I have some favorite flowers in spring, among which are the mountain-daisy, the hare-bell, the fox-glove, the wild brier-rose, the budding birch, and the hoary hawthorn, that I view and hang over with particular delight. I never hear the loud, solitary whistle of the curlew in a summer noon, or the wild mixing cadence of a troop of grey plover in an autumnal morning, without feeling an elevation of soul like the enthusiasm of devotion or poetry. Tell me, my dear friend, to what can that be owing? Are we a piece of machinery, which, like the Eolian harp, passive, takes the impression of the passing accident? Or do these workings argue something within us above the trodden clod?"

"There is scarcely any earthly object gives me more—I do not know if I should call it pleasure— but something which enraptures me—than to walk in the sheltered side of a wood, or high plantation, in a cloudy winter-day, and hear the stormy wind howling among the trees, and raving over the plain. It is my best season for devotion; my mind is wrapt up in a kind of enthusiasm to Him, who in the pompous language of the Hebrew bard, 'walketh on the wings of the wind.'" [Burns.]

New York Urate and Poudrette Company.

Not incorporated but carried on by individual enterprise.

The manures are not divided among the Stockholders, as are those belonging to another establishment, but sold to applicants for cash on delivery. Orders are supplied in the order of time in which they are received. Urate 50 cents and Poudrette 40 cents per bushel, with contingent charges for bags or barrels, &c.

The company are daily preparing for use, during the warm, dry weather, the manure collected during the past winter, and will have several thousand bushels ready before the first of October next. The material is disinfected and rendered free from offensive smell, by a compound, every part of which is in itself a good manure.

The experience of the past and present years, 1838 and 1839, on Long Island, has satisfied many of the farmers that these manures have the quickest operation upon vegetable matter, producing greater abundance, and the cheapest of any manure they have ever tried.

Amended instructions for their use, the result of practical experience, will be furnished on application. The effect of Poudrette upon Grape Vines and Horus Multicaulis is beyond all comparison.

This company are erecting large and extensive works in the vicinity of the city of New York to prepare the manure, and farmers and gardeners may confidently rely on a supply.

Orders, post-paid, directed to "The New York Urate and Poudrette Company," Box No. 1241 Post Office, New York, or sent to the store of SHELLEWELL & DEY, No. 365 Fulton Street, Brooklyn, will be attended to.

The Company will be very much obliged to gentlemen who have used the manures, to give them a statement in writing what has been the result of their use and experiments in relation to them.

New York, August, 1839.

Hale's Patent Horse Power and Patent Threshing Machine.

JOSEPH BRECK & CO offer for sale this valuable machine with great confidence in recommending it as the best machine now in use. It will thresh from 75 to 100 bushels per day in the best possible manner. The horse power is calculated to propel any kind of machinery, is very simple in its construction, occupies but the small space of one feet by two, and can easily be transported from one place to another, and when combined with the Threshing Machine it forms the most superior article for the purpose ever invented. They can be supplied at short notice at the N. E. Agricultural Warehouse and Seed Store. August 28.

AGRICULTURAL.

From the Yeoman's (Concord) Gazette.

MIDDLESEX CATTLE SHOW.

The Middlesex Agricultural Society held their annual show in this town on Wednesday. The day had the known character of the orator, brought together a great concourse of people from this and other counties. The first business of the day was the ploughing match, which was strongly contested by ten single and nine double teams:—on no former occasion have we seen the work done so well. Mr Tapley from Essex, came as an amateur, to try his hand with the Middlesex farmers, and he acquitted himself handsomely, using one of Moore's ploughs, made in Vermont. We are not sure that his plough will not be considered one of the best uses. After the ploughing match, the society proceeded to Dr Ripley's church, where prayers were offered by Rev Mr Morse, of Marlboro', and the address was delivered by Mr COLMAN, the Agricultural Commissioner, who kept the attention of the audience for about three-quarters of an hour. His sentiments and opinions were correct, and were delivered with great force and eloquence. We were to see this address in print. The music at the church was admirable.

The show of cattle and swine was excellent; even pen was filled.

The exhibition at the court house, consisting of fruit, vegetables, manufactures and inventions, was respectable. Although we see a falling off in the number of entries of household manufacture, we derive none in the excellence of the work or industry of the artists.—Some enormous squashes were presented by Mr Bent, of Sudbury, one of which weighed 162 lbs. for which he asked ten dollars: whether he obtained that sum we did not know.

The dinner at Morse's was well provided and the plate occupied. The toasts, sentiments and speeches at the table were highly amusing. Mr Man gave some very encouraging accounts of agriculture of the county.

In the whole we see no diminution in the interest which has been felt for these festivals. But we see that they have become the *festivals of the people*, and that they must be continued. No other can bring together the community with any thing like the benefit conferred by these shows; we consider the small sum allowed by the society to each society, as so much devoted to the interests of the people.

After the premiums were publicly declared at court house, the following officers were chosen for the year ensuing:

John Nelson, of Lexington, President,
Nathan Brooks, of Concord, 1st Vice President.

Wm. Parker, of Sudbury, 2d Vice President,
Timothy Prescott, of Concord, Recording Secretary.

Josiah Bartlett, of Concord, Corresponding do.
Nehemiah How, of Concord, Treasurer.

PREMIUMS AWARDED.

of territory where the obstinacy of habit and blind adoration of ancient customs are still to be combated and overcome. How this is most readily to be effected, is yet a matter of question: in the great work of reformation and improvement, our agricultural papers are certainly, so far, entitled to the largest share of merit; but their influence has been mostly confined to the upper class of farmers—men of intelligence and property, who expect to realize a certain per centage for their investments, which, failing to obtain in the ordinary methods of cultivation, they seize with avidity upon any thing which promises better; and partial success prompts to further experiment. With these, prudence and a just economy are all that is necessary. Once excite the energies of an intelligent mind—let it be interested in the occupation before it, and its course must be onward. The field of agriculture is the field of science, and the further we advance in it, the brighter and more interesting are the charms unfolded to our view.

It is the poorer, and by far the larger class of farmers, for whom the sympathies of the more enlightened should be enlisted. Their improvement offers a wide field to the philanthropic and patriot also; for as they excel in numbers, so also must their efforts affect the general prosperity of our common country. But their numbers exclude the possibility of individual exertions in their behalf, furnishing them with cheap publications, or giving them access to works of science which they can comprehend, we may certainly benefit a few, but the great mass must be operated upon in a different manner; with them, the value of any instruction cannot be appreciated, unless its connection with material improvement be distinctly shown.—It must be spoken to in the language of dollars and cents, and this can only be afforded by legislation, in the shape of premiums, for excelling in the different branches of their business. Tell a man who has been accustomed to get his stock rough the winter by feeding them the refuse and marketable forage from his hay or grain crops, that it would be better to devote time and labor to the cultivation of roots for the same purpose, and he cannot comprehend you; nor will he, so long as he does not clearly see the advantage; but urge him to the attempt by offering a sufficient inducement, in the shape of a premium for any particular crop, and when it is once grown, it must be either sold. In either case it acts beneficially; it must be obviated to the dullest mind, that at will remunerate the purchaser, certainly must produce, if consumed in the like manner. The same argument holds good with stock, and the various products of the farm. Offer sufficient inducement to raise none but the best, and poor will speedily disappear. And why should it be so? Can our legislators who have frowned down every effort to extract but a pittance for a noble purpose, offer one plausible reason for withholding it? Can they be so wilfully blind as refuse to see its benefits, or so wanting in patriotism as to deny but a small amount for a public good, when they unhesitatingly lavish thousands for the enrichment of the few, who openly speculate in the property of that public? If so, then upon them should be cast the reproach which now afflicts itself to the low state of agriculture in our country. And let those who now feel the reproach, direct their indignation in the proper place, and when the proper time arrives.

of our country. It is high time for them to show the strength of the material they are made of. Let their voices speak from the ballot box—let them discard all party distinctions, and look only to the integrity and honesty of their candidate, and let him be one who has shown, by his exertions in their behalf, that he has his country's good at heart.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Oct. 5, 1839.

E. M. Richards exhibited a seedling Clingstone Peach, large, handsome, and of fine flavour; it is a very near approach to Kennedy's Carolina Clingstone.

Mr Nathan Barrett, of Concord, exhibited a basket of native Grapes; they appeared to be the common black Fox Grape, improved by cultivation.

Mr Warren exhibited the Urbaniste, Buffum, Easter Beurre and Duchess Angouleme Pears, very beautiful specimens.

Mr Downer exhibited Gansel's Bergamot Pear and one unnamed sort, also baskets of Isabella and Catawba Grapes.

Jona. French, Esq; of Dorchester, exhibited six sorts of Apples unnamed, among them we recognized Gardner's Sweeting and the Fall Harvey. Also the Chaumontel, Capsheaf, and Green Sugar Pears, and a basket of Peaches unnamed.

Mr J. G. Cooledge, of Cambridge, exhibited Yellow Rareripe and Lemon Clingstone Peaches, and Seckel Pears.

Mrs Bigelow, of Medford, exhibited the monstrous Pippin Apple, and Kenrick's Heath Peaches. William Oliver, of Dorchester, exhibited a basket of Melacot Peaches, very superior.

Amos Holbrook, Esq. of Brookline, exhibited a basket of Hubbardston Nonesuch Apples; these large and beautiful specimens were well calculated to increase the high reputation this apple has already obtained.

E. Vose, (President) exhibited the Lemon Clingstone, Orange Clingstone, Welles Freestone, Morris' White Rareripe, Alberge, and done unnamed Peach. Also the White Chasselas and Gross Frankenthal Grapes, very handsome specimens of cultivation in the open ground.

The Lemon Clingstone, it will be seen, is the Large Yellow Pine Apple of Cox, the description of which we have copied from his "View of Fruits."

"No. 24, Large Yellow Pine Apple, sometimes called Kennedy's Carolina Clingstone, is a very large rich Peach, of an oblong form, pointed at the blossom end—the skin a dark yellow, with a brownish red cheek—the flesh very yellow and rich, of a very sprightly taste, the part next the stone lightly tinged with red; it ripens in September."

Mr Carter, of the Cambridge Botanic Garden, exhibited fruit of the Rose Apple (common name) grown under glass, with the following note:

"Eugenia Malaccensis. This fruit is very agreeable to the taste, and esteemed wholesome. It is very common in most of the islands of the South Sea, and is cultivated almost every where between the tropics."

Mr Samuel Phipps presented for exhibition a plan in wood for preparing a leaden trough for the prevention of the ravages of the Canker-worm, invented by Mr Herreshoff, of Bristol, R. I. This mode is found to be entirely effectual for the purpose, and at comparatively small expense, and sev-

eral gentlemen are about making trial of it in the vicinity.

In addition to the weekly contributions of members and others, the Society still further to increase the facilities for acquiring Pomological knowledge, have provided a large collection of fruits, which may be seen at the Weekly Exhibitions; the sorts which had arrived at maturity and were examined by the Committee were the following Pears: Autumn Bergamot of the English and Americans, (Coxe, No. 22) Begnagotte d'Autonne of Duhamel, Beurre Diel, Huguonot, Surpass Vergoulose, Cumberland, Belle Lucrative, Hacon's Incomparable, Jalousie, Endicot, Seckle, Buffum, Louise Bonne d'Jersey, Long Green, (Coxe No. 30) Henri Quatre, Belle et Bonne, and Bartram's.

The Committee make the following remarks—The Belle Lucrative was pronounced most superior, being sweet, juicy, and melting. Henry 4th, although of the most unpossessing appearance, was of a very rich, high, and unusual flavor, and would in its improved size and color, amply repay for its cultivation in rich earth, either trained to an Espalier or Wall. The Huguonot is another good Pear, obtained from seed by that eminent Horticulturist, the late George S. Johnson, of Salem. The tree was longer in producing fruit than the Johnson or Namkeag; the specimen examined was rather over-ripe; in future years we expect to see it placed in the first class of Pears.

For the Committee,
ROBERT MANNING.

Management of Sandy Loams.—Mr Duckett, of Surry, England, a most accomplished and successful farmer, ascribed the luxuriance of his crops to three principles, which he laid down for his guidance, and strictly adhered to. He relied upon, 1st, deep ploughing, by means of which the roots of his plants were permitted to penetrate the earth to a depth where they found a uniform moisture, by which they were preserved in a healthful and flourishing condition, while those of his neighbors, who were shallow ploughers, in seasons of drought were measurably destroyed.

In Flanders, in the Peys de Waes, where the soil was originally a barren white sand by a sure process has been brought to a state of fertility which entitles it to be called a fruitful loam. At first it was barely scratched, being ploughed not more than ten inches deep; it was subsequently gradually deepened as it was enriched,—and it is now stated that this barren sand has been so fertilised that it bears to be entrenched to the depth of fifteen or eighteen inches. This operation is performed every seven years.

Clay Soils.—All clay soils intended for spring culture should be turned up in the fall, to receive the benefit of the action of the winter's frost, which mellow and reduces it infinitely better than any treatment which man is susceptible of giving it. If very tenacious, its condition may be greatly improved by simply adding sand to it, after the ploughing, and so harrowing it as thoroughly to mix the two together. Instances of the success of this practice are numerous in Europe, and are said to have been so decidedly striking as to excite surprise. In numerous cases the advantages have been equally great as if the clay had been heavily manured.

Milch Cows.—These animals should always, if possible, be kept where they can have free access to good water, whether ranging in the pasture or

hesitate not to say that having water always at hand will make a difference of 25 per cent. in favor of their yield. In winter no man should pretend to keep a cow to the pail who does not provide her twice a day with either good rich slops, pumpkins or roots. How in the name of St George can it be expected that a cow fed upon dry hay, fodder or tops, from November till April, can secrete any considerable quantity of milk: we know that there is a large quantity of nutritive matter in each of these kinds of provender; but to replenish the udder, it is necessary that some such liquids or succulent pabulum named, be daily given. No one should keep a cow to the pail who does not keep her well; humanity as well as true economy are both consulted in so doing.

Marl.—The meliorating effect of marl has been known in Europe for a long time, and clay, stone and shell marl have been severally used with decided advantage, and as our tide water regions are well supplied with each of those varieties of calcareous matter, we trust, as a beginning has been made, that wherever obtainable, our farmers will freely use it. Of this they may be certain, that nothing like permanent improvement can be effected without the use of calcareous nature of some kind. With the aid of lime, or marl in some one of its forms, with the addition of grass leys or green crops of some kind turned in, almost any soil may be pushed beyond even its primitive state of fertility.

Accumulation of Manures.—The scrapings of the road, the lanes, leaves collected from the woods, weeds from fence corners and any where else, marsh mud, fresh or salt, and indeed all vegetable or animal offal, if spread on the surface of your cow yard, becomes in a few months as good manure as stable or cow dung, for in addition to their own specific virtues, they sponge up and retain great portions of rich liquids which would otherwise be lost. All cow yards should be basin-like in form so as to prevent the escape of such liquids.
—*Farmer & Gardener.*

AGRICULTURE AMONG THE ROMANS.

Agriculture, among the Romans, was the great business. The first men studied its principles, directed its operations, and wrote treatises for the instruction of the unlearned. Some of the writings of Cato, Varro, Virgil, Columella, Pliny and Palladius have reached the present age. They show a familiar acquaintance with all the details of farming. The wealthy citizens who spent their winters in the city and their summers at their villas in the country, personally superintended every department of their business. "Though the operations of agriculture," says the author of Ancient Husbandry, "were generally performed by servants, yet the great men among the Romans continued to give particular attention to it, studied its improvement, and were very careful and exact in the management of all their country affairs." "After the landlord," says Cato, "has come to the villa and performed his devotions, he ought that very day, if possible, to go through his farm; if not that day, at least the next. When he has considered in what manner his fields should be cultivated, what work should be done and what not; next day he ought to call the bailiff, and inquire what of the work is done and what remains; whether the laboring is far enough advanced for the season, and

all other things. When he made himself acquainted with all of these, he ought to take an account of the workmen and working days. On holidays, old ditches may have been scoured, a highway repaired, briers cut, the garden digged, the meadows cleaned from weeds, twigs bound up, thorns pulled, far (bread-corn, maize,) pounded, all things made clean. When he is fully satisfied in all these things, and has given orders for the work that is to be finished, he should inspect the bailiff's accounts; his accounts of money, corn, fodder, wine and oil; what has been sold, what exacted, what remains, what of this has been sold, whether there is good security for what is owing. He should inspect the things that remain, buy what is wanting for the year, and let out what is necessary to be employed in this manner. He should give orders concerning the works he would have executed, and leave his orders in writing. He should inspect his flocks, make a sale, sell the superfluous wine, oil and corn; if they are giving a proper price, sell the old oxen, the refuse of the cattle and sheep, wool, hides, the old carts, old iron tools, &c. Whatever is superfluous he ought to sell. A farmer should be a seller, not a buyer."

And Columella directs the proprietor, on returning to his farm in the spring, "to view his marshes, inspect every part of his farm, and observe whether in his absence, any part of discipline or watchfulness has been dispensed with; and whether any vine, any tree, or any fruits are missing. Then, likewise, he ought to revisit the cattle and servants, all the instruments of husbandry and household furniture. If he continues to do all these things for some years, he will find a habit of discipline established when he is old; and at no age will he be so much impaired with years as to be despised by his servants."

These directions are valuable, even in our day, to landed proprietors, particularly in the south, whose farms or plantations are managed by overseers or agents. There is great truth in the saying of Poor Richard, that a man who would thrive by the plough, must himself either hold or drive.—*Cultivator.*

GRAIN CROP OF 1839.

Having lately traversed the great grain growing district of New York in various directions, from Onondaga to Buffalo, and having availed ourselves of all accessible sources of information in regard to the grain crops, which have now been secured, we shall here give our impression of the actual state of the harvest, particularly wheat, respecting which such conflicting statements have been circulated.

That there was an unusual quantity of land sown to wheat in the western district, both in the autumn of 1838 and in the spring of 1839, is evident to every one acquainted with the region. While the autumn sown wheat, there was some little failure from the extreme drouth about the time of sowing, but the injury from this source was not serious or extensive. The wheat plant stood the winter remarkably well, and the low temperature of June and July with the frequent recurrence of rains, contributed to give an unusual growth of straw, heavier it is believed, than was ever before produced in New York. The only thing that has caused much loss, was the blight, rust, or mildew, which in some districts struck the wheat while in its milky or

say that had been left without an attempt to harvest them; but they were rare, and we have no doubt that the whole damage sustained from this cause has been much overrated by many. Low, moist locations, a rich soil, and a rank growth of straw, were the places and the grain that suffered most. From multiplied observations and enquiries, we are convinced that the average loss on the wheat crop cannot exceed from five to seven per cent., while some have estimated it at from fifteen to twenty, and even higher. Where the blight did not operate, the wheat is unusually fine, and the berry plump and heavy, yielding flour of the best quality. The wheat crop of 1839 then, if not extravagantly large, as some have supposed, is a good one, more than a medium one, and far greater than those of '36 and '37. As the country had been almost drained of wheat, the surplus of the present year cannot be excessive; and under such circumstances the notion that wheat must sink to ruinously low prices to the farmer, is absurd and groundless. Fair remunerating prices are already realized and will doubtless continue; while the extravagant ones of 1838 cannot be expected, and are hardly to be desired.

In those counties where the growing of barley is a prominent object, as it is in the eastern part of the district, the crop is unusually fine, the berry of an excellent quality, and the yield large. Barley is the crop that is usually first sold by the farmer, and is generally threshed and marketed within 60 days after harvesting. It may be considered a fortunate circumstance that this crop is good this year, as it furnishes one of the very best materials for making pork, and the partial failure of the corn crop will cause it to be extensively used for this purpose. Improved cultivation and experience in growing barley, has gradually increased the quantity raised per acre, and given grain of a much superior quality to that first produced in the district. As it is a good grain to sow when lands are to be seeded, and sells quickly, and at fair prices, independent of its farm value, it is likely to remain rather a favorite crop, particularly in those parts where wheat is at times liable to be injured by the severity of the winters.

New York has never produced a better crop of oats than has been grown the present year. Not an instance of failure has come to our knowledge from any quarter. In the wheat growing sections few cattle are kept, very little hay is cut, horses are almost wholly relied on for farm labor, and the oat crop is devoted to their subsistence. Hence on many farms scarcely any crop is grown other than wheat and oats; while on those where the husbandry takes a wider range, and the growing of cattle and sheep come in for a share of attention, the making of hay forms a prominent object of cultivation. For several years past, oats have been one of the most profitable crops grown for sale by the farmer, and the present is not likely to prove an exception.

The quantity of spring wheat sown this year was large, and as a whole, the crop is excellent. In some instances it suffered from the blight, and the heaviest, latest growths, were, as in the case of winter wheat, the most injured. For making the finest flour, spring wheat can never compete with autumn sown grain; but it makes a bread preferred by many to any other, and the greater certainty of its growth in many places will cause it to increase

Corn has not of course been harvested, but at this time, (the middle of September), there can be no question as to the crop. It is on the whole a partial failure. We saw a few pieces that might be called very good, some that were pretty fair, but the greater part had a miserable appearance. In ripening, the crop is from fifteen to twenty days later than it was last year, and the growth is very inferior. This result may be attributed to the low temperature of the summer months, which while it was favorable to wheat, was destructive to corn. It is clear that in the main, farmers must rely on something besides corn for the making of their pork; and as in many places, apples which have been greatly relied on, have also failed, peas, barley and potatoes must become substitutes.

The quality or quantity of the roots grown the present season, cannot be ascertained at present with much accuracy. As the season has been such as usually produces the best crops of potatoes, it is reasonable to suppose, considering the quantity planted, that the yield will be a large one. We observed considerable quantities of ruta baga, and some very fine pieces; but as a whole the appearance was not promising. The complaint was common that the fly had injured the young plants essentially; and the wet, cold weather about the time of sowing, by rendering the growth slow and the plants feeble, rendered them subject to depredations for a longer period than usual. The experience of this year with us, has rendered apparent here what has long been considered certain in England, that in growing turnips, the great effort should be to place the manures in such a way as to force the young plants through the first stages of their growth with as much rapidity as possible, and thus shorten the period of greatest danger. The carrot culture is extending, and on grounds suitable to its growth, his root exhibits a good appearance. The carrot, without question, one of the most valuable of cultivated roots, and we are pleased to see that it is, in common with the turnip, gaining ground in public estimation. The sugar beet has been extensively distributed the present year, and its generally fine appearance proves there is no difficulty in producing it in any desirable quantity. We hope practicability of converting it into sugar will be roughly tested in this country this fall; since, should the manufacture succeed, one great source of foreign dependence and one of the greatest drains on our national resources, would be cut off.

Looking at the crops as they are, all classes have the most abundant reasons for gratitude. The feasibility of abundant crops with fair prices has been proved, and while this is the case, neither producer or consumer have any cause of complaint.—Slight and temporary fluctuations in the regular and proper order of things must be expected to take place; but the immutable laws that regulate all such matters, will, if left to themselves, unfettered by monopolies or combinations, soon restore the interfering elements to their proper place, and give harmony and equality to the whole system. Both producer and consumer have by the events of the last or three years, been taught lessons of political as well as domestic economy, which they should soon forget, and by which they will do well to profit.—*Genesee Farmer.*

A medal is offered by the American Institute, New York, for the best silk reel.

last two summers and falls, my duty called me into the apple regions of the North. The following facts were obtained in reference to this subject.

Good eating apples are worth on an average 25 cents a bushel. Eight bushels of apples make a barrel of cider, and twelve barrels of cider make a barrel of brandy. Brandy, at 50 cents per gallon, would give but fifteen cents per bushel! This on an orchard of 100 trees in ten years, would be over \$1000! No allowance is made for capital and labor connected with distilling. Take these into consideration and the loss is much greater.

It costs no more to raise good apples than those only suitable for distilling. Very often apples are worth one dollar per bushel, and the loss is immense by turning them into brandy. I am told that at Mobile apples are worth \$10 a barrel.

Engrafting and budding will change the character of an orchard, and more than compensate for the time and amount lost, in producing the change in ten years.

Apples make most excellent food for horses. Several physicians of extensive practice in Connecticut and Massachusetts, feed their horses on apples and hay. I have never seen fatter horses or more lively; they require less grooming than horses fed on grain. Mr Norton, of Farmington, Conn., has about the finest pair of horses I have ever seen. They are fed mainly on apples and hay. They travel very fast, and seem to have both wind and bottom. It is proper, however, to say, that so much grain is not given to the horses of the north, as is customary at the south. One fact is worth noticing: horses fed on apples do not eat as much hay as when they are fed on grain. Very sour apples injure the teeth of horses; but when boiled they do not. The rule of feeding is to commence with a small quantity and gradually increase the amount per day for one year.

Apples are most excellent food for bees. The fattest beef I have ever seen, was made so by sweet apples.

Nothing will fatten mutton quicker than apples. It is necessary or best, to cut up apples when fed to sheep.

Hogs care nothing for corn, if they can get apples. If sweet, the apples may be given without boiling—if sour, they must be boiled. Mixed with corn meal the flesh is firmer.

Apples increase the quantity and quality of milk. At first there was a prejudice against giving apples to milk cows, because it was thought they diminish or dry up the milk; but given in proper quantities, the effect is quite different.

Cattle and hogs are bought and fed on apples, and sold at a fine profit, when to fatten them on corn would ensure a loss.

Sweet apples and good eating apples are to be preferred as food for horses, sheep and cows; also for hogs, though some recommend a mixture of sour and sweet apples for hogs.

If these remarks should induce any to test their correctness by making a fair experiment, the object of my writing will be fully answered.

THOS. P. HUNT.

The Maine Farmer says that the following will cure broken wind in a horse, if timely applied: Beat well together 1-4 lb. of common tar and as much honey; then dissolve them in a quart of new milk; let the horse fast two hours before the drench is given: give it every second day with warm food.

ROHAN POTATOES.

Beverly, 24th Sept., 1839.

MESSRS J. BRECK & Co.—Gentlemen—On the first of May last I planted thirteen hills of Rohan potatoes in my garden (or nursery,) some two, some three eyes in a hill, in all thirtythree eyes, two of which did not come up; the thirtythree eyes weighed less than eight ounces; the ground is a rich loam inclining to clay, with a stiff clay subsoil, moist through the year. I manured with a good shovelfull of strong compost in each hill.

I have this day dug the potatoes from these thirteen hills, and find they weigh one hundred fifty-eight and a half pounds. The eight largest weighed thirteen, and the twenty largest, thirty pounds; and the whole filled a flour barrel rounding full.

I planted some on high land, soil loose—also some on high, stiff clay soil: they did well—the poorest averaging less than twelve hills to the bushel, although in both soils they were injured by the dry weather. I am satisfied they require a moist, rich soil, and in such soil they will yield double or treble as much as any other potato I am acquainted with.

Very respectfully, your ob't serv't,
JOSIAH LOVETT, 2d.

For the New England Farmer.

Dracut, 3d Oct., 1839.

MESSRS J. BRECK & Co.—As there has been so much said about the yield of the Rohan potatoes, I will send you the result of my crop from ten ounces which I bought about the first of May, and gave sixteen cents. I cut out of two small potatoes the eyes and put them into a tea cup of new milk and soaked them three days and then planted them in fifteen hills; but one of the hills was broken down, so that I had fourteen hills only, and I dug them to-day. On account of the mice getting in one of the hills, I think, I lost about two pounds, the remainder I weighed which amounted to eightytwo pounds, some of them weighing 20, 25, 28, and 32 ounces. The bearer of this saw the above. Yours, &c.

HUMPHREY WEBSTER.

Planting garden seeds in the Fall.—Two years ago, after taking the vegetables from our garden, we immediately prepared the beds and sowed onions, parsnips, carrots, lettuce, beets, cabbage, &c. on the fourteenth of October. They were covered with rye straw, and litter, and manure from the barn yard thrown over them to the depth of four or five inches. In the spring, as soon as the frost was out, this was removed, and we found that in consequence of the straw not being well threshed, much rye had dropped upon the ground and had taken root, in extricating which we rooted and destroyed a large portion of our young plants, which had already started and were doing well. What did grow, however, did well, and were large enough to use a number of days sooner than those planted as early as the weather would permit. Plants from the cabbage seed sown in the fall were much more thrifty and produced larger heads than those of the same variety sown in spring. We name this as the result of a single experiment, and as we are in no situation to repeat it this year, we should like to have some of our friends try it and let us know the result.—*Maine Farmer.*

BOSTON, WEDNESDAY, OCTOBER 16, 1879.

CATTLE SHOW AT WORCESTER.

The annual Cattle Show of the Worcester Agricultural Society was held at Worcester on Wednesday, 9th inst. The weather was as fine as could be desired and the attendance was never more numerous. Indeed, the roads were crowded with vehicles of one description and another; and the side walks were so thronged with men and cattle, that it required considerable skill in navigation, a good deal of "luffing and bearing away," and occasionally rounding to," to make any headway at all.

The show of animals in the pens of the society, we may say, we think without extravagance, was magnificent; for really we hardly know how otherwise to characterize it. There were no less than four hundred and seventy-three entries; and the pens of the society were not only full but overflowing, so that several animals brought for exhibition from the immediate vicinity, were sent home to make room for competitors from a distance; and several were tied at different posts for want of other accommodations. It would be an idle attempt to undertake to particularise in this case, and the full and elaborate reports of the several committees, which we shall have the pleasure to lay before our readers, will do perfect justice in this respect.

The fat oxen took the precedence in the pens. The great ox Columbus weighed 2601 lbs.; he was from Princeton, and seems to have been made after the pattern of the little Wechusett bull in his neighborhood—Having now descended, how the fellow (we were going to say *poor* fellow, but that will not do,) is ever to get back again to the top of his native hills is not so easy to divine. An ox belonging to L. & E. Barnard, weighed 2252 lbs.; another from J. Adams, Rutland, 2115 lbs. and another to J. Estabrook, of Princeton, 1920 lbs. A pair of oxen belonging to John Reile, of Sutton, weighed 3758 lbs.; a pair from J. Estabrook, 3580; a pair of oxen from Northboro', 3905 lbs.; and a pair belonging to L. & E. Barnard, 3914 lbs. In this matter of grass-fed oxen, and most of them native stock, we will challenge in the same number, even Southfield to beat us.

The show of bulls was excellent, and in this case the improved stock made up of the Durham Short Horn and crosses between the Ayrshire and our native breeds, distanced very far our native breeds. One bull calf, represented as partly Durham, 15 months old, weighed 872 lbs.; a yearling leifer in the same pen weighed 845 lbs. A bull calf belonging to B. Miller, and less than seven months old, weighed 604 lbs. A bull from Sutton, of great excellence in all points, weighed 1495 lbs. A bull from Needham, owned by Jabez Smith, was a very fine animal, though not "sticked up" for the occasion.

The milch cows were numerous and fine. A cow sent by Thomas W. Word, of Shrewsbury, was remarkable for her size and excellence of form. She was a descendant from Deaton, who was of great service in the improvement of the stock of the county. The milch stock from the hospital was of the most beautiful description, showing the best of keep and care. We do not believe for the number, there is better stock in the State; and certainly none in better condition. They are any thing but insane. One of these cows gave in the best of the season, twenty measured quarts per day, but whether beer or wine measure we were not able to ascertain. A native cow from Sutton had made thirteen and half pounds of butter per week.

The stock of John Welles, Esq., of Dorchester, which there were numerous specimens, attracted a continued crowd around their pens. No gentleman has done more or succeeded better in the improvement of his stock than Mr Welles. His young animals were singularly beautiful; so was a cow exhibited by him.

The exhibition of sheep was small; but the animals both of the Dishley cross and the Merino and Saxony stock were good. Worcester county is not a large sheep district. The amount of this description of stock is comparatively small. We believe they would derive a great advantage from the introduction of the South Down among them, crossed with the native or Merino; and that some proportion of this stock would pay better than their dairies.

The show of swine was admirable. There is not much humor in a hog, though young pigs are not wholly without it; but there is some merit in being the cause of wit in others; and to them, therefore, however unconscious they may be of having conferred the obligation, we are indebted for a report, which did them ample justice; and sparkling and bubbling with humor, gave equal pleasure to the assembly who heard it. The hogs from the hospital, a stock bred and improved there and fair rivals of any breed in the country, were capital. The Berkshire breed was fully represented in the pens. A Berkshire boar two years old, excellent in every respect, owned by Jas. H. Clapp, weighed 443 lbs.; a boar owned by Samuel A. Knox, seven-eighths Berkshire, in every respect fine, weighed 270 lbs. and received the highest honors of the occasion. A Harvard boar was exhibited by the Shaker family from Harvard.

We have omitted to state in its proper place, that there were some very fine animals of improved neat stock exhibited by Mr Ormsum Willard, which were deservedly honored with the premiums of the society.

The working cattle shown on the occasion and the noble team of seventy-five yoke of oxen from Sutton, a town which stands first in the commonwealth for its admirably trained teams, was a beautiful sight.

The drawing match was well contested, but called away by other engagements, we had not the pleasure of witnessing it.

In the ploughing match there were eighteen competitors, ten double and eight single teams. The ploughs used were all, excepting one and that of a Hartford pattern, of the pattern and make of Ruggles, Nourse & Mason, of Worcester. They are good and approved instruments.

The lots consisted of one-eighth of an acre each, and the work was finished in times varying from one hour and five, to one hour and fifteen minutes. The ground was hard, dry, and stony; the required depth was reached with much difficulty, and the plough even in skilful hands, continually thrown out. The teams in general were very young, but in fine condition and admirably trained. The ploughing was good; but we should do injustice to our opinions if we pronounced it more than that. In saying this, however, we utter only our own private judgment, and with no want of respect for the competent committee, who pronounced a different verdict. In almost every case the ploughing failed to reach the required depth; it was very difficult to do this, but there were two other, as we deemed them, errors, to which there was scarcely an exception. The plough was not held vertically, but went too much to land. This very much increased the difficulty of draught and made the land side of the furrow ragged. In the next place, the furrow slice was almost always too wide and the outside of it at the bottom was not cut by the

furrow slice should never be drawn, than the heel of the plough, or the width of the share; in this case the attempt was to make it even wider than the plough at the top of the mould board; or indeed as wide as the wing of the plough could be made to force over. It is impossible in this mode of ploughing to do justice to the land or to make good work. Candid minds will certainly ascribe these remarks to no disposition to find fault. We have no such feeling; but our only desire is to advance, as far as our humble ability will permit us, to contribute to it, the cause of good ploughing and good husbandry. We know very well the sensitiveness to criticism, which prevails in our community. But in practical matters every thing should yield to the great objects of public improvement; and we know no way by which these objects can be so well advanced as by the free but respectful utterance and interchange of opinion.

The hall of the society was filled with articles of produce, and mechanical and manufacturing ingenuity. The report of Gov. Davis on mechanical inventions and tools was a capital paper, full of instructive remarks, which we shall have great pleasure in giving to the public; and the report of Mr Thomas on all other inventions and articles, was highly entertaining and piquant.

Squashes, Rohan potatoes, beets, &c. &c., samples of corn, Dutton and Tree corn, showed good soil and excellent cultivation, and displayed the unlimited bounties of Divine Providence. The dairy produce, and especially the butter, was excellent, and left little room for improvement in the manufacture or style of preparation for market.

The address at the church by Mr Foster, of Worcester, was unassuming, sensible and interesting, and gave universal satisfaction. It was preceeded by some interesting remarks of the president of the society, referring to its history, condition and prospects, which we shall give in another place.

The Massachusetts Society for promoting agriculture were represented on this occasion by a committee of two gentlemen, John Welles and Henry Codman, Esqrs.—The Massachusetts Society this year gave two hundred dollars at Worcester, to be bestowed in premiums in conjunction with the premiums of the Worcester county society. On the part of the Massachusetts Society this was a highly liberal appropriation, and brought numerous competitors from different parts of the State.

The people assembled on this occasion were not the least interesting and agreeable part of the exhibition. We were repeatedly asked if we thought any other part of the State could present such an assembly. Our simple answer is, that we believe an assembly more respectable for good appearance, good manners, sobriety, intelligence, could no where be found; but then let us thank God that every part of our State is full of such people.

TRANSPLANTING—This is a fine season for transplanting trees, shrubs, and herbaceous perennials. Almost any kind of trees, forest or fruit trees, (pears, perhaps, excepted,) and for fruit-bearing shrubs, cuttings, raspberries, and the like, we are satisfied that the sun is the best time for transplanting; the labor can be performed with more ease, for the earth is in a better condition to settle about the fibrous parts of the root and if the tree or shrub can be so firmly protected that the wind as not to be blown over or disturbed, the process of rooting, if not going on during the winter, commences with the first opening of the spring, and many weeks before the ground will be so late

...nsuring orders from those who are wise enough to
 take advantage of the present favorable season. Their
 stock is immense, and comprises all the most desirable
 varieties, from the cedar of Lebanon to the hyssop
 that springeth on the wall."—*Cour.*

ERRATUM—On page 131, in the communication of
 I. A. J., for £1920 read \$1920.

BRIGHTON MARKET—MONDAY, Oct. 14, 1899.
Reported for the New England Farmer.

The storm has prevented us from making up our re-
 port as usual. A large quantity of stock of every de-
 scription remains unsold, much of which will be dis-
 posed of tomorrow.

About, 800 Beef Cattle, 1500 Stores, 2,500 Sheep and
 1200 Swine are at Market.

Prices.—Beef Cattle.—Former prices were not sus-
 tained on the second and third quality. We quote First
 quality, \$7 25 a \$7 75. Second quality, \$6 25 a \$6 75.
 Third quality, \$5 00 a \$5 75.

Stores.—Sales were made at prices very unequal and
 lower than last week. We quote Yearlings \$11 a \$15.
 Two Year Old \$17 a \$27.

Cows and Calves.—Sales \$25, \$32, \$45, and \$65.
Sheep.—The price of pelts has since last week very
 materially declined, and the few lots sold were at re-
 duced prices. Lots were sold at \$1 62, \$1 92, \$2 25,
 \$2 50, and \$3 00.

Swine.—A very few sales only were effected. A few
 tons to peddle were sold at 4 1-8 for sows, and 5 1-8 for
 barrows. At retail 5 1-2 a 6 for sows, and 6 1-2 a 7 for
 barrows.

N.B. A few Berkshire sows warranted full blooded,
 —the pedigree can be furnished if required—will be at
 market next week.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors
 of the New England Farmer, Brighton, Mass. in a shaded
 northerly exposure, week ending October 13.

Oct., 1899.	6 A.M.	12 M.	6 P.M.	Wind.

Sunday,	13 54	70	56	S.

PEAR TREES.

For sale at the garden of the subscriber a large collection
 of Standard and Dwarf Pear Trees comprising most of the
 choice varieties of European and American origin.
 Orders by mail will be immediately answered.
 ROBERT MANNING.
 October 16.

DUTCH BULBS.

Daily expected from Holland a very extensive assortment
 of Bulbous Roots comprising numerous varieties of Tulips,
 Yacynth, Narcissus, Crocus, Crown Imperials, Lilies,
 Jonquilles, &c Those who wish to avail themselves of
 this opportunity to enrich their collections, are requested
 to send their orders, which will be promptly attended to,
 and forwarded, as soon as they come to hand.
 JOSEPH BRECK & CO.
 October 16.

ROHAN POTATOES.

For sale at the New England Agricultural Warehouse and
 Seed Store, No. 52 North Market Street, at 65¢ per barrel.
 JOSEPH BRECK & CO.

...now offered, are of the most celebrated and surprising kinds.
 The Pears are unusually fine—the Peach and the Cherry
 Trees are also fine, and in very extraordinary numbers. The
 Catalogue of Fruit and Ornamental Trees and Shrubs,
 Roses, and Herbaceous Flowering Plants, for 1899, is ready
 and will be sent to all who apply. In that catalogue the very
 best kinds of fruits, so far as proved, are particularly designat-
 ed by a star.
 100,000 Mosses Multicaulis Trees or any other reason-
 able quantity, or cuttings of the same, are now offered. The
 trees are genuine; all being raised by the subscriber, either
 at his Nursery here, or at his Southern Establishment at
 Portsmouth in Lower Virginia. Also the E'ata, Cockspur
 and Buckthorn for Hedges, &c &c Canton, Broussa, Moret-
 ti or Alpine, and some other Mulberries.
 All orders will be promptly attended to and trees when so
 ordered will be securely packed for safe transportation to
 distant places. WILLIAM KENRICK,
 Nonantum Hill, Newton, Mass. Oct. 9.

**Fruit and Ornamental Trees, Flowering Shrubs,
 Plants, &c.**

The present being the most favorable season for trans-
 planting all hardy trees and shrubs, we would remind those
 who are in want of Fruit or Ornamental Trees, Shrubs,
 Herbaceous Plants, &c that we can furnish them at short
 notice at nursery prices, well packed for transportation to
 any part of the country. JOSEPH BRECK & CO.,
 October 16.

PEAR, PLUM, GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds;
 1000 Plum Trees of the most approved kinds and extra
 size—many of them have borne the past season;
 500 Quince Trees;
 3000 Isabella and Catawba Grape Vines, from 6 to 15 feet
 long, most of them have borne fruit—Black Hamburg,
 Sweetwater, Pond's Seedling;
 30,000 Giant Asparagus Roots;
 5000 Wilmot's Early Rhubarb or Fie Plant, lately intro-
 duced.
 Also—a good assortment of Gooseberries, Roses, &c. of
 different kinds;
 All orders left at this office, or with the subscriber at Cam-
 bridge-port, or in Mr Lynch's baggage wagon box, at Gould
 & Howe's, No. 8 Faneuil Hall, will meet with immediat
 attention. SAMUEL POND,
 October 9. Cambridge port, Mass.

GARDEN SEEDS.

The subscribers are now receiving their full supply of Gar-
 den, Field and Grass Seeds, and would respectfully recom-
 mend to their customers to send in their orders as early as
 possible to secure a supply from their choicest lots. Their
 stock of seeds for this season will be very full and complete,
 and most of the varieties being raised under their own in-
 spection they can confidently recommend them as being fresh
 and genuine. Among them are Long Blood, Early Turnip
 and Sugar Beets; Beta Laca, Mangel Wurtzel, Orange Car-
 rot, Radish, Cucumber and Cabbage of sorts. Also, Peas,
 Beans and Squashes, which together with a large supply of
 most kinds of seed desirable for the field or garden, comprise
 the most complete and extensive assortment of seeds to be
 found at any similar establishment in the country.
 JOSEPH BRECK & CO.
 Oct. 9. N. E. Agri Warehouse and Seed Store.

HOUSE IN DORCHESTER.

To let a large and convenient house, pleasantly situated in
 Dorchester, one third of a mile beyond Dr Codman's meeting
 house, and between five and six miles from Boston; together
 with 1-2 acres of fine land, well stocked with fruit trees.
 There are good wells of water—a fine barn, cheese house,
 and corn barn, and convenient out buildings. The above
 affords a rare chance to some practical person wishing to
 carry on a farm; possession given immediately. Apply at this
 office.
 October 9.

BONE MANURE.

The subscriber informs his friends and the public, that
 after ten years experience, he is fully convinced that ground
 bones form the most powerful stimulant that can be applied
 to the earth as a manure.
 He keeps constantly on hand a supply of Ground Bone,
 and solicits the patronage of the agricultural community.
 Price at the Mill 35 cents per bushel; put up in casks and de-
 livered at any part of the city at 40 cents per bushel, and no
 charge for casks or carting.
 Also, ground Oyster Shells.
 Orders left at the Bone Mill, near Tremont road, in Rox-
 bury, at the New England Agricultural Warehouse and
 Seed Store, No. 52 North Market Street, or through the Post
 Office will meet with prompt attention.

BERKSHIRE BOAR.

For sale, a fine Berkshire Boar, 9 months old, and large
 of his age, bred in Albany, from imported stock. The pedi-
 gree will be furnished at the time of sale. Price \$50. Ap-
 ply to Messrs. J. BRECK & CO.,
 September 18.

THE SILK BUSINESS.—Much good, we think, will result to the country from the preparations for the raising of silk. Our climate is peculiarly congenial to the insect that produces it. The women, children, and infirm persons scattered among our population, from whose labors little or nothing is realized, are competent to supply twenty millions of dollars value in silk per annum, instead of which we have imported in a single year more than that amount—a sum double the value of the whole exported products of the United States for the same period, from all our boasted fisheries, with all the exports from our forests, of skins and furs, lumber, masts, and all our manufactures of wood, our naval stores, tar, pitch, turpentine, pot and pearl ashes, &c., and also from our almost innumerable farms; all our exported beef, tallow, hides and cattle, butter, cheese, pork, bacon, horses, mules, sheep, &c. with our entire exports of wheat, corn, and flour superadded. The whole catalogue of this formidable portion of a nation's hard earnings for foreign exportation, did not in 1836 equal twelve millions of dollars, while the imports of silks the same year, exceeded twenty millions of dollars; and by including silk and worsted goods, of which silk constituted an important part, they amounted to over twenty-three millions five hundred thousand dollars. This alarming statement, the report from the treasury department will fully verify. Is it not high time that silk should command our attention?—*Albany Cultivator.*

BITE OF A CAT.—It is stated in a Boston Medical Journal that the bite of an enraged cat will produce a violent species of hydrophobia, in illustration of which the following instance is given.

A milkman having remarked a cat often coming to steal the milk in his dairy, lay in wait for it, and attacked it with a hatchet. There was a considerable contest, until at last, the cat, unable to avoid a blow, leaped at the man and seized him by the chin, whence there was no possibility of detaching it, save by cutting off his head. The patient was carried to the hospital, and the preventatives of hydrophobia applied. On the twenty-second day the fatal symptoms made their appearance; he experienced much difficulty in swallowing water, but this he overcame with great fortitude; the difficulty increased; the wound became bad; the patient became furious, endeavored to bite every one that came near him, was bound in chains and immediately broke them in pieces, leaped from bed, ran up and down the hospital, attempting to bite all he met, till, reaching the outer door, in order to escape, he was seized with a shivering, and fell dead. On dissection, the appearance of this case was precisely the same as that of hydrophobia."

COMMON SENSE.—Notwithstanding its appellation, this quality is one of the most uncommon attributes of our nature. It is seldom found in men of high literary attainments, in artists or divines; and although self-educated men not unfrequently possess it, it is rarely the property of those who are educated by others. There are also some who possess the characteristic to a certain degree, but in whom it is by no means active. Those persons for instance, who give very excellent advice to others, but who never follow it themselves; resembling in that particular poor Goldsmith, who "never said a foolish thing, yet never did a wise one." Nor is

result of great powers of observation, combined with a wide field for their exercise. For how should the monk, whose sphere of action is limited by the walls of his cloister—the poet, who deals principally with the fanciful creations of his own imagination, or the divine bewildered in the mazes of doctrinal theology, acquire that which is almost exclusively the property of the man of the world—of men of action rather than of speculation—of practice rather than of theory. From the absence of this essential requisite is it, that we find so many crude imaginings, so many feeble conceits, so much puling sentimentality among our magazine poets and tale writers; so many insults to the understanding from the pulpit; so many blind leaders of the blind among the editors of newspapers; so much quackery and pretension and so little reality.

Without common sense, no poet can ever reach the hearts of his readers, no divine can ever benefit the souls of his hearers. Shakspeare, Dante and Moliere possessed it to an uncommon degree, and their works yet retain all the freshness of originality, unimitated and unimitable. It was common sense and its inseparable concomitant, sound judgment, rather than splendid abilities, which rendered Washington the saviour of his country; and it was the same high attribute of humanity which conferred an imperishable fame upon the lives of William Penn, Roger Williams and Dr Franklin.—*N.Y. Sun.*

PURSUIT OF KNOWLEDGE.—Every rational creature is fit for something, but not fit for every thing. It is the part of wisdom to ascertain for what we are best adapted, and to employ our energies accordingly. Knowledge is valuable for all stations in life; and that is best which is best adapted to fit us for the station we have to fill and the duties we have to perform. Parents sometimes make a great mistake in the education of their children, bestowing a great deal of time, property and labor on the attainment of knowledge which, in all probability, will be of little or no use to them in future life: while such knowledge as is really essential to their respectability, success and usefulness, is comparatively, if not altogether, neglected. Is not this the case when the farmer's or tradesman's daughter, who will, in all probability, one day be a farmer's or tradesman's wife, spends years in learning French, music and embroidery, while she grows up ignorant of arithmetic, and domestic business? A thorough acquaintance with their own language, with practical arithmetic, with men and things, would have been ten times more valuable than all the Greek and Latin, and heathen mythology, to which the attention of boys is often exclusively directed.

THE WAY TO BE HAPPY.—Cut your coat according to your cloth, is an old maxim and a wise one; and if people will only square their ideas according to their circumstances, how much happier might we all be! If we would come down a peg or two in our notions, in accordance with our waning fortunes, happiness would be always within our reach. It is not what we have or what we have not, which adds to or subtracts from our felicity. It is the longing for more than we have, the envying of those who possess that more, and the wish to appear in the world of more consequence than we really are, which destroys our peace of mind and eventually leads to ruin.

Farm and Garden. —Fruit and Ornamental Trees, Shrubs, Creepers, Herbage, &c., Perennials, Green House Plants, &c. Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed, and forwarded to any part of this or other countries. September 25. 1841

A Young Man Wanted on a Farm.

The advertiser is in want of a smart young man that is well acquainted with the cultivation of vegetables, and one that is also capable of taking charge of horses, cows and swine, (one that understands it, he must be energetic, active and fond of neatness and order; he must produce evidences of a good moral character. Such a person may find a permanent situation by calling on Messrs BRECK & CO. None need apply but such as answer to the above. September 25. 1841

WINSHIP'S BRIGHTON NURSERIES, AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbage, &c., Perennials, Green House Plants, &c. Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed, and forwarded to any part of this or other countries. April 10.

Morus Multicaulis Trees from Seed.

The subscriber offers for sale 10,000 trees produced from seed of the genuine Morus Multicaulis. The seed was raised on his premises in 1838, the trees have been multiplied for the two last years by layers, their growth is more rapid than the original tree, and appear to be sufficiently acclimated to endure the winter, some of them having been left standing in the open field unprotected during the two last winters without any essential injury. The leaves are very large and equal in quality to any other kind for feeding the silk worm. Those who are wishing to purchase a superior kind of Mulberry are requested to call and examine for themselves, before the foliage is destroyed by frost.

CALVIN HASKELL.

Harvard, September 11.

MULBERRY TREES.

The subscriber has on hand a quantity of Mulberry Trees of a quality which is probably superior to any kind ever introduced into this country. They were imported four years since and though they have sustained the rigorous cold of the last three winters entirely unprotected, yet it is believed a Southern or Western climate would be more admirably adapted to their growth and propagation. Their foliage is most luxuriant, and affords more nourishment than any other variety. Silk produced by worms fed with the leaves, has been pronounced by judges to be the best ever manufactured by them, and decidedly superior to the best Italian. A few thousand will be sold for sale if immediate application is made to the subscriber, where specimens may be seen.

Also—a few hundred Morus Multicaulis and Asiatic. JOHN N. BARBOUR, September 11. No. 30 Commercial Street, Boston.

GREEN'S PATENT STRAW CUTTER

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent features of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been achieved by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

THE NEW ENGLAND FARMER

is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

AGRICULTURAL.

From the Providence Journal.

CATTLE SHOW.

The annual Fair and Cattle Show of the Rhode Island Society for the Encouragement of Domestic Industry, was held at Pawtuxet, on Wednesday, the 9th inst. The attendance was very large, and the exhibition was, upon the whole, although deficient in some particulars, the most interesting held in a number of years.

The Stock was uncommonly fine, and a larger number than usual was upon the ground. There were several noble looking bulls, though there was no competition for the premium of \$100, for the best full blooded bull. A number of them were seven-eighths blooded, and several fine animals full blooded, but they did not come within the condition of the show bill, and were offered not for premiums but merely for exhibition. The Committee spoke with great pleasure of the evidently increased attention devoted to the raising of stock in this state, and the consequent improvement which had taken place.

The Working Cattle were also better than usual. In awarding the premiums the committee observed a disadvantage under which they labored, inasmuch as they had no opportunity to test the strength of the cattle by actual experiment, and were therefore guided only by the appearance. With regard to cows, also, it might be observed that they are frequently offered for premiums with claims founded on some particular excellence which cannot be understood by the committee, unless explained and properly authenticated.

The Exhibition of Butter and Cheese was not quite so large or quite so good as usual, and the committee complained that one very important item was uniformly omitted by the competitors, viz: a statement of the process of making, as required by the show bill. This should be more generally attended to. If a man makes remarkably good butter, it is of course highly desirable that the community should know how he makes it.

The Shop Manufactures made but little show.—There were a few specimens of female ingenuity, and some other deserving objects, but very few of the premiums offered in this department were contested for. Numerous gratuities were given.

To the Household Manufactures, pretty much the same remarks will apply. The exhibition was small and few of the premiums competed for, and nearly all of them awarded were gratuitous.

The Swine were of excellent quality and in good numbers. At no previous exhibition have there been present so many fine hogs. The improvements which have taken place in the breeds of swine, were highly spoken of by the committee.

The Ploughing Match went off finely. Only a few ploughs were entered, but the oxen were all noble looking, and it was very gratifying to observe that the competition was less than usual for speed, and far more than usual for the quality of the work. The whole field was well ploughed, and the oxen

were not over driven. The ground given to each plough was one-sixteenth of an acre, and the time occupied in ploughing it was from twentyfive minutes and twentyfive seconds, to thirtyone minutes.

For Agricultural Experiments and Vegetable Products, there was no legitimate competition. The show bill required a full and minute account of the manner of raising the crops, of preparing the soil, and the expense of cultivation. This was not presented in a single instance, and consequently the committee declared no premiums, but recommended gratuities for numerous specimens of agricultural products, remarkable, generally, for their size. The pumpkins, squashes, beets, &c. were of enormous dimensions.

The following is a list of the premiums awarded:

Agricultural Experiments, Vegetable Crops, Grain, &c. &c.

- To David Phillips, 3d, Clayville, R. I. for specimens of cocoons 81
- " Samuel Slocum, Pawtuxet, for one cabbage 1
- " Mr Barnes, Providence, for cellery 1
- " Reuben Mathewson, Johnston, for 4 squashes and 1 beet 2
- " Wm. Ballou, Smithfield, for 1 squash 1
- " Robert H. Niles, Pawtuxet, for margel wurtzel beets 2
- " Samuel Webster, Johnston, for 1 pumpkin 1
- " John S. Aborn, Cranston, for 33 lbs. potatoes from 6 oz. seed 2
- " Benj. Hopkins, Scituate, for 3 pumpkins weighing 160 lbs. 2
- " Samuel W. Greene, North Providence, for 3 crook-neck'd squashes 1
- " Geo. W. Gardiner, Warwick, for 2 crook-neck'd squashes 1
- " Caleb Greene, Warwick, for 3 Cuba squashes 2
- " Augustus G. Millard, Warwick, for 3 lots morus multicaulis—sample ruta bagas, do do 3
- " I. G. Chadsey, Wickford, for box of seed peppers 1
- " Rowland Evans, Providence, for 1 squash 1
- " Daniel Brown, Johnston, 1 squash weighing 86 pounds 1

On Neat Stock excepting Working Cattle.

- For the full blooded bull, no competition.
- For the 2d best bull 7-8 Durham, Benoni Waterman, Cranston \$20
- For the 3d best bull, Samuel Webster, Johnston 10
- For the best full blooded bull calf, Emanuel Rice, Warwick 25
- For the best native bull calf, John Smith, N. Providence 8
- For the next best, Byron Sprague, Warwick 6
- For the next best, Joseph Butler, Pawtuxet 4
- For the best full blooded cow, Benoni Waterman, Cranston 20
- For the next best cows, three in number, same do 20
- For the next best cows, two in number, W. Rhodes, Warwick 10

- For the next best cow, John Giles, Providence 5
- For the best heifer yearling, Benoni Waterman, Cranston 4
- For the next best do do, Amasa Sprague, do 2
- For a pair of twin heifer calves, Stephen Farnum, Cumberland 4
- For a 7-8 blooded short horned Durham bull calf, brought up by hand, Daniel C. Bowen, Cranston 2
- For a bull calf 4 months old, Charles Knight, Johnston 2
- For a full blooded cow, Emanuel Rice, Warwick 5
- For two heifers 1-2 blooded Durham, John Giles, Providence 2

On Working Cattle.

- First premium to John Burlingame, Gloucester 6
- 2d do to Smith Phillips, Johnston 4
- 3d do to Eul Baker, Warwick 2
- To the owners of each yoke of working cattle which were entered but failed to obtain a premium 1

On Butter.

- 1st premium, John A. Gardner, Cranston 15
- 2d do Benjamin Griffin, do 12
- 3d do Samuel Webster, Johnston 10
- 4th do Benoni Waterman, Cranston. 7
- 5th do Arnold Spink, do 6
- 6th do Leicester Arnold, Johnston 5
- 7th do Benjamin Hopkins, Scituate 2

On Cheese.

- 1st premium, Earl Baker, Warwick 6

On Shop Manufactures.

- To John Fenner, Cranston, for one dozen hay rakes 3
- To Alpheus Burges, Providence, for one doz. cotton pickers 3
- To James F. Slocum, Providence, for one pair calf skin boots 1
- To Cranston Furnace Co., Cranston, for one purifying coal grate made from cast iron, for household use, ornamental and apparently very economical, and of superior workmanship 8
- To Nathaniel G. Helme, Providence, for an improved iron safe, substituting cement for wood lining 3
- To Benjamin Waterman, Chepachet, for one bedstead and washstand, made from maple of native growth 5
- To Augustus Winsor, for one carryall, a very neat made article for children 1
- To E. W. Walker, Providence, for calf and lamb roller skins 3
- To J. Metcalf & Co., Providence, for one side belt leather 3
- To Liscomb & Thurber, Providence, for one piano forte, of fine tone and superior workmanship 10
- To David Benedict, Pawtucket, for sewing silk, well manufactured and of brilliant colors 15

To William Garlin, Providence, for miniature high pressure engine
 To Joseph Greene, Providence, for coconut dippers

On Household Manufactures.

To Mary L. Green, Warwick, 1st premium for carpeting 6
 Freelove Baker, Warwick, 2d do for do 4
 Andelisa Updike, East Greenwich, 3d do do 3
 Alice Gordon, Warwick, 1st premium on woollen hose 2
 Frances W. Smith, North Providence, 1 do linen do 2
 Ahmira Baker, Warwick, 1 do cotton do 2
 Mary Ann Arnold, Warwick, do worsted do 2
 Waity Gardner, do do flannel do 5
 Charlotte A. Sherburne, Providence, lamp mat 1
 Eliza Jane R. Wesson, do do 1
 R. Chase, Pawtuxet, 2 do 1
 Elizabeth Low, Warwick, 1 pair crickets 1
 Sarah Joslin, North Providence, 1 shell case and box 1
 Harriet Fisher, Warwick, 2 fancy boxes 2
 Caroline E. Jones, Woonsocket, 1 table cover 2
 Emily L. Angell, Providence, 1 shawl 1
 Warwick Circle Industry, cotton and yarn hose 1
 Mary L. Green, Warwick, 3 pr woollen do 1
 Rosanna Green, do 3 do do do 1
 C. Webster, Providence, 1 lamp mat 1
 A. E. Spalding, do 1 pr crickets 1
 Phebe Ann L. Hammett, Coventry, 1 lace veil 1
 Susan H. Greene, Warwick, 1 piece blanket- ing 2
 Harriet R. Ewer do yarn and worsted stockings 1
 Mary E. Abron, Pawtuxet, cotton stockings 1
 Eliza D. Gardner, Warwick, blanketing 2
 Mrs Carpenter, Coventry, fur gloves 1
 Miss Bowler, Providence, box flowers 1
 C. S. Edward, do grate aprons 1
 Eliza Thurber, Cranston, card boxes, &c 1
 Maria Bowen, Warwick, 1 straw carpet, &c 2
 Nancy E. Arnold, do hearth rug 1
 Mrs A., Pawtuxet, do do 1
 Elizabeth N. Gardner, Warwick, do do 2
 Mary Harris, Pawtuxet, woollen hose 1
 Maria Horton, Johnston, bed quilt 1
 Diana W. Waterman, Warwick, coverhd 1
 Julia A. B. Smith, Providence, fire board 1
 Eliza Jane R. Wesson, Providence, shawl 1
 Emily L. Angel, do rocking chair 2
 Mary Jastram, North Providence, worsted bonnets 1
 Eliza A. Richmond, Scituate, hearth rug 1
 Betsy Ellis, Providence, embroidered apron 1
 C. Vaughn, do 2 vases, &c. shell work 1
 E. Cowing, do work bag 1
 F. Cowing, do do 1
 Susan B. Kinnicut, Warren, rug 2
 Caroline E. Jones, Woonsocket, embroidered shawl 1

On Swine.

1st premium for boars, John Giles, Providence, 10
 2d do for boars, Amasa Sprague, Cranston 8
 3d do " Robinson Perry, Warwick 8
 To 6 other fine boars each 4
 1st premium for pigs, 4 in number, B. Lewis, Providence 8
 2d do do do, Wm. Ballou, Smithfield 6

3 " " Nehemiah Thurber, do 2
 4 " " Rowland Evans, Providence 2
 1 " " Ezekiel Smith, Johnston 2
 " " Wilkes Gardner, Warwick 2
 " " Simeon L. Colburn, Providence 2

Ploughing Match.

1st plough, Waterman B. Angell, Johnston 9
 2d " South Philips " 8
 3d " Earl Baker, Warwick " 7
 4th " Benoni Waterman, Cranston " 6
 5th " Samuel Webster, Johnston 5

The Annual Meeting was held at the Society's Hall, at 8 o'clock in the morning. Previous to the election, Dr Jackson, geologist of the State, delivered an address upon the nature of soils and of manures. He spoke particularly of the soils of this state, and gave several analyses, the results of his own experiments. He spoke of the necessity of some vegetable manure for the land in this state—said that we possessed inexhaustible, but hitherto almost unnoticed agricultural treasures in our peat beds. When properly decomposed and prepared, peat makes a manure equal to any thing which can be procured. Dr Jackson also produced a new specimen of corn grown upon peat bogs hitherto uncultivated and considered barren. The ears are large and full, and contain eighteen rows. The stalk is much smaller than that of the common kind, and thus renders it less exhausting to the soil. Samples were taken by different members of the society, who we trust will give a good account of them. The lecture was listened to with great attention, and we have no doubt, will prove productive of good.

The society then proceeded to the election of officers, when the following were chosen:

President—James Rhodes.
Vice { 1st, Stephen T. Northam,
 2d, John Pitman,
Presidents, { 3d, Nathan F. Dixon.

Standing Committee—Dutce Arnold, Christopher Rhodes, Wilbur Kelly, Stephen H. Smith, Wm. E. Richmond, Moses B. Ives, Bates Harris, John Foster, Thomas Holden, Sion A. Rhodes, Joel Aldrich, Jeremiah Whipple, Wm. Anthony, John Brown Francis, Stephen B. Cornell, Lewis Dexter, Charles Collins, Nicholas S. Fry, Elisha Olney, jr., George Burton, Tully Dorrance, Richard W. Greene, Nathl Mowrey, jr., Joseph Mauran, John Jenckes, Sterrey Jenckes, James P. Simmons, Owen Mason, Joseph Harris, Christopher Smith, Daniel J. Tourtellot.

Treasurer—William Rhodes.
Secretary—William W. Hoppin.
Audit.—Christopher S. Rhodes, James G. Anthony, Elisha Dyer, jr.

Quite a number of new members joined the society.

At one o'clock the members of the society sat down to an excellent and substantial dinner prepared by Mr Humphrey. The dinners of the society should be conducted differently. There should be speeches, and songs, and toasts, and not a mere contest who can put the greatest quantity of food down his throat in the shortest given time.—Flowers should ornament the table, and there should be more to indicate the character of the society.

The auction for stock and premium articles was omitted.

ESTEEMED FRIEND, J. BUEL—“Walker on intermarriage,” is the title of a work just republished in this country. Its object is to point out the rules to be observed in the selection of wives, with a view to the production of a beautiful, healthy and intellectual offspring. Although the primary object of the author is to ameliorate the form and intellect of the human species, by means of judicious intermarriages, yet he treats largely on the means of improving inferior animals by means of breeding, and asserts that all his newly discovered laws relative to the human species, are equally applicable to domestic animals. It is to the views which he takes of this latter subject, that I wish to call the attention of my agricultural brethren. Although I do not think he has demonstrated the laws, yet he has certainly brought forward a very respectable body of proof for their support, sufficient at least to induce those who are interested in obtaining good animals, to give their serious and careful attention to his views.

It is necessary to observe, in order to render the sequel intelligible, that by the “locomotive system,” we mean the organs of support, of motion, and of connexion, or bones, ligaments and muscles; and by the “vital system,” we mean the organs of absorption, circulation, and secretion. The organs of absorption are sometimes denominated lacteals or lymphatics; their use is to absorb the nutritious portions of the food from the intestines, and to convey it to the heart, where it is mingled with the blood. The organs of circulation are the blood vessels, which circulate the blood from the heart to the extremities, and from the extremities back to the heart. The organs of secretion are the glands, where the various fluids of the body are secreted. The foundation of Walker's system of breeding is, that “like produces like.” This has been stated before, but never satisfactorily shown to be the case, or in other words, while other authors have stated this to be the rule, they have at the same time stated such a numerous list of exceptions, that we are left in doubt whether it is any rule after all. These exceptions are shown by Walker to be only apparent and not real.

The second law is extremely important if true, (and in order to ascertain whether it is so or not, nothing more is necessary than for one farmer in every county in the state, should observe it for two or three years, and send the result to the Cultivator office.) “Organization is propagated by halves,” that is, one parent communicates to the offspring the fore part of the head, the long part of the face, the forms of the organs of sense, and the whole of the internal nutritive system. The resemblance to the parent who thus communicates “the vital system,” will therefore be found in the forehead and long parts of the face, as the orbits, cheek bones, jaws, chin and teeth, as well as the shape of the organs of sense and the tone of the voice. The other parent communicates the posterior part of the head, the bones, ligaments and muscles, or the whole of the fleshy parts. The resemblance to the parent who thus communicates the “locomotive system,” must be found in the back head, the few more moveable parts of the face, as the external ear, under lip, lower part of the nose, eyebrows, and the external forms of the body, in so far as they depend on the muscles, as well as the form of the limbs, even to

the fingers and toes, &c. If this law be correct, viz. that "organization is propagated in halves," or that one parent gives the *whole* of the "vital or nutritive system," and the other the whole of the "locomotive system," it will be perceived that many of our commonly received opinions and practices are erroneous. In crossing, we are commonly directed in the selection of a male to choose one most perfect in the points where the female is most deficient. But from this law we learn that we shall not in all cases, accomplish our object. If a part of the "vital system" in the female is deficient, and we seek to improve the progeny by crossing with a male, perfect in these particulars, yet defective in some other portion of the vital system, we shall fail, because one parent must necessarily communicate the *whole* of the vital system, as the other must necessarily communicate the *whole* locomotive system.

But I shall trespass too much on the columns of the Cultivator, by tracing out the practical inferences. I shall therefore confine myself to a bare statement of the laws themselves. If we inquire now we are to ascertain in what cases the male will give the locomotive system, and in what cases he will give the vital system, we are told by Walker, that where both parents are of the *same variety*, it is impossible to predict which series of organs will be communicated by the male, as between a bull and cow, both of the Short-Horns, or both of the Herefords. But in cases where the parents are of different breeds, as a Berkshire sow and China bar, both parents being of equal age and vigor, the male gives the back head with the locomotive organs, and the female the face and nutritive or vital organs. In individuals of the same *family*, that is, breeding in and in, as between mother and son, brother and sister, precisely the reverse takes place; the male then gives the face and vital organs, and the female the back head with the locomotive organs.

I have thus briefly stated some of the more important laws of breeding, discovered by Walker.—Of course, in the narrow limits of a communication it is impossible either to give the facts from which the laws were deduced, or the important practical consequences resulting from them. These latter, however will readily suggest themselves to intelligent breeders. What I have written is offered with a view to guide them in observing the laws of creation, and in the hope that if these laws are found to correspond with their experience, they may be induced to communicate their observations to the columns of the Cultivator. N. N. D.

HINTS FOR THE SEASON.

"Like produces like," is an accredited maxim among farmers. Hence he who wishes to rear fine males should take care to secure good breeders, and he that would raise fine grain and roots, should take care to save or procure good seed in time.—This is the season to attend to these matters, particularly in regard to seed corn. If it has not already been done, no time should be lost in selecting the earliest and finest ears of corn, twin ears, if possible, of stripping off most of the husks, of drying or wringing them, and hanging them in an airy loft to dry. Seed corn should never be suffered to go into a pile with the main crop, as it may rot, or mould, and lose its germinating principle. The corn has been cut up and stooked, the early and fine ears may be readily distinguished, when the crop is gathered, by the color of the husks and the tightness of the grain.

The admonition which we give extends alike to other farm and to garden seeds; and in regard to the latter, it may be remarked, that they keep better in their capsules or seed vessels, than otherwise, provided they are kept dry.

Steeping seed wheat and other small grains, in pickle, serves two if not three good purposes. 1.—The light and imperfect grains will float, and may be skimmed off. 2.—It will prevent the crop being smutty; and 3.—it will insure a more prompt and even germination. And if the seed is afterwards lined before it is sown, as it should be, it will tend to preserve it from the attacks of insects. As a covering of one inch is thought sufficient for seeds that have been acclimated, covering with the harrow is deemed better than covering with the plough. "The wheat produced after the land has been lined, is believed to be thinner skinned, and to yield more good meal than other wheat, and to make better bread."

To secure the best kinds of seed, of garden products, the most healthy plants must be chosen, and those which are most early in respect to the season; these should be so insulated, as to have no weak plants of the same species or even genus, in their vicinity, lest the fecundating dust of weaker plants should be blown by the winds upon the stigma of the stronger, and thus produce a less vigorous progeny.

To collect good seeds, consists not in procuring new seeds from distant places, as is generally supposed, but in selecting the best seeds and roots of your own. This rule was practised successfully by the late Joseph Cooper, of New Jersey, who thus continued to propagate from his own seed for many years, with manifest advantage. We, however think there are exceptions to the rule, in the potato and other crops where it is difficult, if not impossible, to make the required selection. In saving his radish seed, Mr Cooper took ten or twelve that he most approved of, and planted them at least one hundred yards from others that blossomed at the same time. In the same manner he treated all his other plants, varying the circumstances according to their nature.

Seeds retain their vegetating principle for a greater or less length of time, according to the manner of their being kept, and according to their structure and properties. Thin seeds, as the carrot, parsnip, lettuce, &c. cannot be depended on after they are a year old. Peas and English beans will germinate well, it is said, at seven years old, while our common garden bean will seldom do well after the first year. Cucumbers, melons, squashes and pumpkins, are said to improve to the fifth, sixth and seventh year—the older the seeds are, the less the plants run to vine, and the more to fruit. Seeds have been made to vegetate and grow which have been one hundred years old, by the use of oxygenated muriatic acid and water.

To preserve seeds they should be kept dry, and kept alike from great heat and great cold. To transport them with safety a great distance, and especially to or from a tropical climate, the practice has been successful of mixing them with brown sugar, or with charcoal dust, or with raisins, in a close vessel.

All seeds should be sown when the soil is just ploughed or dug, as by these operations much atmospheric air is buried, which is essential to the germinating process; and the ground is without moist, another requisite to quick growth.—*Cultivator*.

CATTLE SHOW.—The Cattle Show for the counties of Franklin, Hampshire and Hampden, was held at West Springfield, Wednesday, October 9. The number of animals on exhibition was unusually large, and very excellent in quality. The working oxen were very superior. Two 'strings' of them were arranged, each containing, we should judge, fifty yoke. They were fine looking, and some were really beautiful; and they all bespoke the kind treatment of their masters. One yoke, we were informed, had lately been sold for over \$300.

The fat cattle, cows, and young cattle, were not numerous but good. Mr Heenan Day, of West Springfield, presented a superb fat ox. It is said to be the largest ox in the State. He is a noble fellow, and his sleek appearance is enough to make the mouth of an epicure water for a 'cut' from the 'tender loin.'

The exhibition of swine was also very excellent. A large number of the Berkshire breed, 'black as minks,' were exhibited. They appeared 'as easy as old Tilly'—their equanimity being not in the least disturbed by their numerous visitors, nor their pride puffed up by the high distinction shown them. One old lady swine attracted considerable notice, not on account of her breed, but for other distinguished qualities. She had been the mother, within the period of about five months, of thirty little porklings! If the committee did not give her a large premium, they were very deficient in the performance of their duty. But an old gentleman of the swine family bore away the palm. This was a porker from Chicopee Falls, weighing only 1,000 pounds. He was two years and eight months old. He was not very fat, but of course, of enormous frame. The old fellow reclined his ponderous frame upon a bed of straw in a cart, (for he didn't walk to the show, no, not he,) and maintained a very quiescent state.

The exhibition of *Domestic Manufactures* was very meagre. There were some fine rag carpets, and a lady's cape, made of the tips of Peacock's tail feathers, a beautiful article, the handiwork of some 'fairy fingers.'

The specimens of butter and cheese were very few, and those of vegetables were not numerous. We noticed one squash which weighed 153 pounds. Mr D. L. Child, of this town, presented a very fine specimen of brown sugar, manufactured by him from the beet, which was undoubtedly very acceptable to the public, for they eat it all up.

The address was delivered at the Town Hall, by Wm. G. Bates, Esq., of Westfield. It is said to have been a very chaste and sensible production.—*Hampshire Gazette*.

[Communicated.]

Friday, Oct. 19th.

MR BRECK—Dear Sir—] I would like through your columns to inquire if there is any effectual remedy against fleas in dogs. Various mixtures have been tried without success, such as solutions of tobacco, snuff, &c.—If any one of your correspondents can suggest something whereby to increase the comforts of this friend to man, he will much oblige
A SUBSCRIBER.

[Remarks.—It is said Scotch snuff will kill the fleas, and good keeping will prevent them. We do not know of any other remedy, excepting cutting off the tail, as practised by J. Lapean.]

Nearly \$150,000 worth of apples are exported to England from this country annually.

It is well known, that these sections of our country which are the most productive of wheat, are either soils based on limestone rocks or such as contain considerable quantities of carbonate of lime in their composition. These facts seem to have induced many to suppose, that no matter what may be the nature of the soil in other respects, if it only contains lime, it will certainly produce wheat.—There can be no doubt that this earth performs a most important part in the production of grain; but the almost unqualified manner in which it is sometimes spoken of, as the chief agent in the growth of wheat, has led us to suppose there was some danger that those farmers in whose soils this earth was abundant, might overlook the necessity of other manures, and suppose their lands of inexhaustible fertility, simply because they contain lime; or that those who properly use lime as a manure, should forget that in time, this application would cease of its desired effect, unless the animal and vegetable matters upon which the lime acts in furnishing food to plants, were also present at the same time. Some of the Geological Reports, particularly those of the eastern States, have a tendency, unintentionally, doubtless, to create or perpetuate the error of which we are speaking. Thus, for instance, Dr Jackson, in his valuable report on Maine, says—

“An imperfect or blighted produce is sure to follow the planting of this grain (wheat) upon soils destitute of lime, while it is well known, that certain districts where the soil contains this mineral, are always favored with luxuriant and heavy crops. This is one of the settled points in agriculture, and one which every farmer should duly appreciate, if he would prosper in his art. Indian corn requires but little lime, and hence we see excellent crops of that grain raised upon sandy plains, unsuited to wheat.”—*Report*, p. 123.

That lime, to a certain extent, is necessary to the growth of wheat, appears clear, but lime alone is not a sufficient application. In some parts of England, lime has been repeated on some lands till it produces no beneficial effect. The vegetable and animal matter being exhausted, lime has nothing upon which to act, and is therefore as inert as so much sand. To some extent, similar results have been found to ensue in this country. In a letter of Col. Springer, of Delaware State, to a friend at the West, he says, in substance, that the continual use of lime on their lands, has much exhausted them; that wheat is not now grown with as much certainty as formerly; that it blows, or does not fill, more frequently than it used to; and that lime can be no longer relied on to ensure fertility or produce wheat. The truth is, the farmers of that section have, in all probability, relied on lime too much and too long, and have not aided its action by animal or vegetable manures, as they ought. In some of the arguments for the use of lime, the fact that lime itself furnishes no nutriment to the plant, seems to be overlooked, and renewed applications of lime are expected to produce wheat or other plants, when the material from which alone they can be formed, is not to be found in the soil so treated.

We imagine it may be considered as a settled point in vegetable and agricultural chemistry, that lime, gypsum, or any of the phosphates, or salts, used as manures, furnish nothing to the food of the plant; they only stimulate the organs of the plant

of the proper food found already prepared in the earth. When the relation which the wonderful force called electro-magnetism has to the circulation of the fluids in plants, is better understood, it will probably be found, that the earths, of which the principal are sand, clay and lime, when properly combined, constitute a complete battery, in which the various salts dissolved in water, excite a current, active or inert, as the battery is more complete or defective. In the water taken into the circulation of plants by the agency of this electric current, is conveyed the materials that go to their formation or perfection; and however powerful the battery, however active the electric current, the plant can be benefited no further than the materials suited to the purposes or wants of the plant, is provided.

That a very small quantity of lime in soils otherwise properly constituted, is sufficient for all the purposes of vegetation, or the production of the best of wheat, no one can question, who has paid attention to the analysis of soils or perused the agricultural sections of the Geological Reports that have been made to the public. Of these, we consider Professor Hitchcock's the most full and valuable; the parts of Dr Jackson's report, and those of the Survey of this State, being thus far nothing more than incidental notices relating to this topic. Examination, chemically, of some of the most fertile virgin soils of the western States, shows but a small portion of carbonate of lime; only from 2 to 4 per cent. The quantity of vegetable or soluble matter suitable for the food of plants, was, however, great; and with this small quantity of lime, gave exuberant crops.

Some of the soils analysed both by Professor Hitchcock and Dr Jackson, contained not a trace, or but the merest trace, of carbonate of lime. But where it did not exist as a carbonate, it was found as a phosphate, or in some other of its many combinations. Thus, among the numerous instances of analysis given by Dr J., we may mention the farm at Wilton, of which the analysis gives of lime 1.5th; and of soluble vegetable matter 12.0; and this land produced 48 bushels of wheat to the acre.

Some writers seem to suppose that a soil cannot be exhausted of its calcareous matter by cultivation. As vegetables contain considerable quantities of phosphate and sulphate of lime, it appears reasonable to us to suppose, unless all the vegetable matter taken from the soil is returned to it again, that exhaustion will eventually ensue; and we think experience proves that such is the case with lime as well as with the vegetable matters of the soil. Soils based on limestone do not always contain the greatest quantity of lime in their composition; but such are rarely exhausted of their lime, the gradual decomposition furnishing the adequate supply; while soils not so based, though containing at first more of the carbonate, become more speedily exhausted, and require applications of this manure much earlier. In several instances we have found soils formed from the decomposition of the shale lying immediately above the great limestone formations of western New York, to contain as much lime as those based on the limestone itself. The experience of every farmer in that district, however, is conclusive of the fact, that the first is the soil that soonest requires the application of lime to render it fertile.

We are convinced that a soil that is called dry,

wheat, with much less lime, provided other manures are equally present, than soils with an impermeable substratum, and, consequently, wet and cold. Limestone soils are dry, because the fissures of the rock allow all superfluous water to pass off; they are warm, because the heat is not carried off by evaporation; and they are fertile, because lime is always present to originate and keep up the active powers of vegetable life. We have come to the conclusion that no soil can be good for farming in which lime in some one of its forms, does not exist. We consider it indispensable; as, without it, we have no proof that those electric currents on which vegetable growth and nutrition so much depend, would exist without it. To suppose that the application of lime alone will keep up or ensure fertility, is as absurd as to suppose that sand or clay alone could do it. Even pure vegetable manure cannot support a plant; the proper mixture and combination of the earths and the food of plants, is necessary; and the great end of agricultural chemistry, and the aim of the scientific and practical farmer is, to ascertain the nature of these combinations, and the power of adapting them with certainty.—*Geologic Farmer*.

APPLE MOLASSES.

There is many a good housewife who has more faith in her own experience, than in the science of chemistry, that knows not the value of apple molasses; but still believes it to be the same kind of tart, snoky, worthless stuff that has from time immemorial been made by boiling down cider. It is not within my province at this time, to attempt to convince such that there is a chemical difference, though it might easily be shown, that they are almost as different as sugar and vinegar. I would, however, invite them to lay aside their cider this year, and try the plan of boiling down the juice of the apple that has not been exposed to the air by grinding and pressing.

Last autumn I placed a number of bushels of Vetterill's sweetening apples in two large brass kettles, with water just sufficient to steam them; when they boiled soft, I turned them into a new splinter basket, containing some straw, and placed on them a barrel head and a heavy weight. The juice was caught in a tub. This was repeated until I had juice enough to fill the kettles, when I commenced boiling it down, and attended to it strictly, frequently skimming it, till it became of the consistency of cane molasses. The native acids of the fruit imparted a peculiar flavor, otherwise it could hardly be distinguished from the syrup of the cane. It was used in my family for making sweetmeats, for sweetening pies, for dressing on puddings and griddle cakes, and a variety of other purposes. The cost of making it is very trifling, and the means are within the reach of every farmer.—*Ohio Farmer*.

Weeds cannot grow near our common cultivated plants without materially injuring them. This is doubtless in part owing to their consuming the nutritive matter contained by the soil, and in part, also to their overshadowing the cultivated plant, and thus depriving it of the direct action of the sun;—but it is also in part owing to the nature of the matter which they deposit in the soil. The common opinion that weeds poison the plants near which they grow, is not mere imagination—it is founded in fact.—*Farmer's Reg.*

BERKSHIRE PIGS.

MR EDITOR—Sir—In a letter recently received from a gentleman in the vicinity of Boston, I find the following advertisement, with a copy of a pictorial representation of one of my breeding sows, which requires some notice from me, to guard the public against deception:—

“BERKSHIRE HOGS.—W. S. Turner has just received 14 pigs from Albany, male and female, of the Berkshire breed. These pigs were procured of Bement & Glanson.

Framingham, June 29th, 1839.”

Now, sir, as regards myself, I deny in toto, of having ever sold any Berkshire pigs to W. S. Turner, or any other person in that town. If Mr Turner purchased them from me, he has some written evidence of the fact, either in a bill, certificate, or letter.

I called on Mr Lossing, (not Glanson,) who emptorily denies ever having sold any pigs to a person by that name.

Mr Lossing also informed me that late in the spring or early in the summer, a person from the east called on him for Berkshire pigs; but having one except those that were engaged, enquired of him if he knew where he could find them, or some that “resembled the Berkshires”!!! And he “was at very particular—the runt would answer, if he could obtain them at a low price.” “Dunder unlixum” a Dutchman would exclaim, “dese tam rants peats de very tuyaal.”

Not long after this, Mr L. was informed that a person going east with a lot of pigs and offering them for sale, exhibited a certificate with his name attached, as an inducement to purchase. This Mr L. declares a forgery.

In another letter lately received from a gentleman near you, I am informed that “most of the drovers who pass through *****, where I keep my wine, have pigs which they call ‘pure Berkshires,’ at least a few in each drove, and the *invariable* story is, that the pigs were got by your boar, out of one sow in your vicinity, by which means they incur the true breed.”

New I am not at all surprised at this, for a man living near me does not hesitate to sell half breeds or the pure blood Berkshire; and, I am sorry to say it, there are others in this vicinity, who would do the same, should an opportunity offer.

Mr L., for aught I know, may have the pure Berkshire pigs; and had he not published that he procured them of me, I should have let it pass unnoticed; but having used my name without my authority, I deem it a duty I owe the public as well as those who have purchased of me, to make the above exposition.

Respectfully, Yours,

CALEB N. BEMENT.

Three Hills Farm, Albany, Oct. 12th, 1839.

For the New England Farmer.

MR BRECK—I noticed in the Farmer a few weeks since, an article upon “Cows holding up their Milk,” and having met with difficulty in one of my cows, I wish information upon the subject, if any of the readers of the Farmer will give it me.

I have a fine, large and stately cow, very gentle, no fault but this. I let the calf suck till seven weeks old, expecting to kill it; but at that time

raise her. She is now 13 weeks old, feeds well, eats grass, and at night stands in a stall near the door. Very frequently the cow refuses to give down her milk without much labor, and often at night she will not give more than half the milk in her bag. She does not curl up her back, as is generally the case, but appears to suck in or draw up her whole bag, leaving the teats dry—and she appears to know what she is about while she does it. Now, Mr Breck, if any of your readers can recommend a cure, I should like it.—or perhaps you, sir, have a remedy; if so, do let me have it, for I value the cow too well to be obliged to sell her.

October 15.

From the Albany Argus of October .

DEATH OF JUDGE BUEL.

We discharge a melancholy office in announcing the death of another of our most respected and valuable citizens. Judge JESSE BUEL expired at Danbury, Ct., at 3 o'clock on Sunday afternoon, in the 63d year of his age. In consonance with the general sorrow, and as a tribute to the character of the first proprietor of this journal, our columns appear in the habiliments of mourning.

Having accepted invitations to deliver anniversary addresses before the Horticultural and Agricultural Societies of Norwich and New Haven, Conn., on the 25th and 27th ult., he left home about a fortnight since, with that view. At Danbury, he was seized on Sunday sen'night with bilious colic, of which he was relieved in the course of the twentyfour hours; but bilious fever supervened, and he sank under it after an illness of more than a week—receiving, during the time, every attention, and unremitting medical attendance from the hands of strangers. It was not until Friday last, however, soon after his son had left him on his return to Albany to request the attendance of his family physician, that the disorder assumed an alarming aspect. He was accompanied on his journey by his only daughter, of whom he took an affecting and final leave, in the full possession of his mental faculties, a few moments before he calmly breathed his last.

Intelligence was brought yesterday morning by express, announcing the expected fatal termination of his illness. It was a melancholy surprise to his anxious family on reaching the steam boat wharf in the afternoon, on their route to his place of illness, to be among the first to learn that his remains had been brought by the Co'umbus, the day boat from New York, which arrived before the departure of the afternoon boat. The body had been brought from Danbury to Poughkeepsie, and thence to this city.

For the last thirty years, Judge Buel has occupied a wide space in the political and agricultural world. In 1813, he removed to this city from Ulster county, and established the Albany Argus. In the following year he was appointed printer to the State, and discharged the duties of that station and of the editorship of the paper, until 1821, when he retired to the farm in the suburbs of the city, since so widely and favorably known as the “Albany Nursery.” After his retirement from his editorial labors, he represented the city for successive years in the popular branch of the legislature, and at the period of his death was a Regent of the University. His last appearance in political life was as the gubernatorial candidate of the opponents of the national administration in 1836.

broad sense of the word, practically and scientifically, that he has built his fame of a public benefactor. As such, he was known throughout this continent and in the old world; and no man has contributed more, as a writer and in practical life, to elevate, inform and improve the agriculturist of his age. Nearly six years ago, as an auxiliary in his plan for the diffusion of knowledge on this subject, Judge B. established “The Cultivator,” a monthly publication of the highest value, and of great and varied information, and which has attained a vast circulation throughout the American continent. His labors, however, were not confined to his monthly publication, ample as were its pages. His pen was in constant requisition upon nearly every subject connected with the cultivation of the soil, and his correspondence throughout the Union and abroad was extensive. In example, not less than in precept he may be said to have conferred blessings that will continue to fructify and ripen into fruit, long after his body shall have mingled with his favorite earth.

As a neighbor and a citizen—and in all the relations of domestic life—he was without reproach. He was esteemed not less for his integrity than his intelligence and worth—for the unaffected affability and simplicity of manner in his intercourse with his fellow men. He may be said to have lived for utility, and to have died in the prosecution of his favorite employment. His death is a public bereavement, which all will mourn as irreparable.

PRESERVING POTATOES.

Wherever practicable, potatoes should be dug during dry weather, as the earth is then less liable to adhere to them, and they soon become dry.—They should be exposed as short a time as possible to the light, as it always injures their quality for whatever use they are intended. Hence a coarse blanket or boards should be employed to cover them in the heap or wagon, during the time that they necessarily remain in the field. Exposure to the light for any length of time, even in a cellar, greatly injures potatoes; the bins therefore, in which they are kept, should be so constructed as to exclude it entirely; in short, they should be kept in a state similar to that before they are dug, that is, secure from air and light, with a slight degree of moisture to prevent withering, and a temperature so low as to keep them from vegetating. The difference in the quality caused by good and bad keeping, is very rarely appreciated.

When they are buried in the field, a dry piece of ground should be selected, which shall be at all times entirely free from surface water. They are to be covered, first, thickly with straw, and afterwards with several inches of compact earth. A second thick coat of straw and another of earth is then to be applied. The straw for the other or second coat, should be long and straight, such as has been thrashed with a flail, and placed in a position so as to throw the moisture and wet from the peak down the side, like the thatching of a roof. This keeps the inner coat of earth dry, and effectually prevents the water from penetrating the heap. The earth for the outer coat should be fine and compact, so as to throw off the rain. If these directions are carefully attended to, there will be no danger of losing potatoes by freezing and rotting, and they will keep in the best condition till spring.—*Gene-see Farmer.*

NEW ENGLAND FARMER,
AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, OCTOBER 23, 1839.

HARDWICK CATTLE SHOW.

The farmers of Hardwick, Worcester county, held a town show on Friday, the 11th inst. Their principal object was to bring out the oxen of the town and compare them with each other. They had an agreeable public dinner on the occasion, and an address from the Agricultural Commissioner, in the meeting house.

The number of oxen presented were not so great as sometimes; but there were one hundred and thirty-five yoke on the common. They were in general very good cattle and in excellent condition. Several yoke which had been grass fed only, exhibited as beef cattle, did much credit to their owners. Twelve teams contested in a drawing match. One of the loads drawn up hill weighed 4000 lbs, and one 3500 lbs. besides the cart. Only one yoke was employed at a time. They in general took the load up hill without difficulty, and showed in drawing and backing, excellent training.—One thing delighted us, which was, the fixed purpose and evident habit of the drivers to get along without scolding, goading or blows. This was done almost entirely. This is a great gain to humanity; and we hope the day is gone by when every thing was to be done with children as well as cattle by whipping and reproaches.

These annual municipal shows cannot be too much encouraged. They excite a spirited and generous emulation; they promote good neighborhood and kind feelings; they show what has been and can be done; and they strengthen the bonds of friendship and good neighborhood.

We think a ploughing match should have made a part of the show, and that the farmers' wives and daughters should have been induced to send some of their dairy produce for exhibition, and specimens of their needle work, knitting or weaving. No great improvements can be made in any of the valuable arts of life unless the public attention by such occasions as these, is frequently and strongly drawn to them. The premiums (merely nominal) were announced after the address; and some of the reports abounded in humor. Hardwick is a hill town, and the farms almost exclusively devoted to the dairy husbandry. In the quality and quantity of its dairy produce, it has long held a high character in the commonwealth. H. C.

WORCESTER AGRICULTURAL SOCIETY.

Ex-Governor Lincoln, the President of the Worcester County Agricultural Society, gave at the meeting house before the address, some interesting facts in regard to the history of this society. It was formed twentyone years ago, and the zeal with which its affairs have always been managed, is unremitted. At the formation of the Society six individuals gave their notes of hand for five hundred dollars each, making a sum of \$3000, which it was necessary should be raised in order to their drawing the bounty of the State, amounting to six hundred dollars. They gave these notes without knowing how they should be remunerated for them; but the subscriptions of individuals in order to become members of the society at five dollars each, discharged these notes in one year, and have put the society upon a firm and liberal foundation.

The funds of the Society now amount to 7500 dollars, exclusive of three hundred dollars in bad debts, and fifteen hundred dollars in buildings and furniture, or

frames for the pens. The entries at the show of the 9th inst were 173; and there were one hundred more than had been made on any former occasion. The arrangements with the State Society brought out several competitors. The entries for the State premiums amounted to thirtytwo; and upon these two hundred dollars were awarded. It was left to the County society previously to determine to what objects these premiums should be applied; and they were wholly given to stock.

The arrangement with the State Society was a very judicious one. It was to be regretted that the Society was not more fully represented on the occasion. The President of the Worcester Society expressed his hope that some combined arrangement between the Worcester and State society might become permanent; and pledged the ready co-operation of the Worcester Society in such arrangement. This deserves much consideration; but its practicability with the full consent of the different sections of the State, is questionable. The farmers in Berkshire, in the three river counties, in Plymouth, in Essex, would not find it easy to reach Worcester with their stock, notwithstanding the increased facilities of intercommunication; and an occasional arrangement and co-operation with the different county societies in succession, would probably be more satisfactory and quite as useful. Where the Trustees of the Massachusetts Society find it inconvenient to attend, they should appoint a deputization of persons not belonging to the county, who would attend.

There is another change which we think should be made. To every society raising a permanent fund of three thousand dollars or reaching that amount by annual subscriptions, the State grant six hundred dollars annually, to be bestowed in premiums. This is a standing law. Now for this money, as well as for that of the Massachusetts Society, the competition should be open to citizens from any part of the State. The county has, of course, a right to dispose of its moneys as it may choose; but the State bounty should be free. No evil could result from this. It would increase the competition; and as excellence and improvement are the only objects, this would greatly conduce to these ends. It would diffuse the knowledge of the different improvements made in different counties. It would in the next place be a great advantage to those farmers who, from their particular location, find it difficult to attend the cattle show of their own, but could conveniently attend that of a neighboring county.

Another arrangement seems very desirable; which is that the Cattle Shows in the several counties should be so arranged by mutual consent as not to interfere with each other. This might easily be done by taking an earlier week in the season or a different day of the week. This year the Middlesex and the Berkshire Cattle Shows fell on the same day; and the Worcester and the Hampshire Cattle Shows on the same days.

It is a very bad arrangement, likewise, to crowd the whole business into one day. Two days are as little time as can be properly given to such a celebration.—Let the first day be for the show of live stock, manufactures and machinery; and after the exhibition they can be removed. Let the second day be given to the ploughing match, the address, and the reports. Let there be two public frugal dinners, which, without wine, need not cost more than fifty cents, so that no farmer need be kept from the table on account of the expense. This is all that is charged at any of the hotels, for as good a dinner as is given at the public table. Wine need not be prohibited to those who choose to call and pay for it. Do away with formal processions, and let the farmers bring their wives and daughters to the table, if they choose to share in the innocent festivities of the

occasion, instead of being left in solitude and neglect, to remain wherever they are put down. Let the hours after dinner and the intermediate evening be passed in agricultural conversation and discussion among the farmers. In this way we think great advantages would accrue and much pleasure be obtained. Or, if it be inconvenient for the ladies to come to the dinner table, then let a levee be held in some hall, where at a reasonable expense, coffee and cakes may be provided, and the evening devoted to pleasant and free intercourse.

Next, let the premiums be declared after the address, on the second day, in full assembly; and delivered publicly in some permanent form to the successful competitors, so that the farmer or farmer's wife and daughter, may have a pride in showing it to their friends and children, and transmit it as an heir loom in the family to those who shall come after them.

This would be doing things as they should be done, and give the highest interest to such shows. Nothing could be more favorable to agricultural improvement and the general improvement of our rural population, than two days thus spent in the course of the year. The farmers in the neighborhood could easily go home at night and carry some distant friends with them; and as to those who come from afar, they are now obliged to pass one or two nights in the town. Nothing can be worse than the present arrangement of crowding every thing into one day; and how the committees get through their duties as well as they do, it is difficult to conceive. They are debarred all the pleasures of the occasion, and their attention must be exclusively and almost painfully confined to the particular objects of their appointment.

H. C.

DEATH OF JUDGE BUEL.

Intelligence of the decease of this valuable man and distinguished friend of the agricultural interest of the country, reached Worcester on the morning of the Cattle Show, and produced profound and sincere regret.—At the dinner an appropriate notice was taken of the event by the President, and resolutions of respectful remembrance of the deceased and condolence with his bereaved family, were offered by the Agricultural Commissioner, and will hereafter be published.

Judge BUEL has effected an amount of good in the country which few other men can lay claim to having done, and few are able to accomplish. To strong powers of mind he added great accuracy of observation and much acquired knowledge and experience: an extensive acquaintance with men and things; much practical skill; a deep sense of the importance of agriculture and rural economy to the country, and a most active and hearty interest in the elevation of the character and the improvement of the condition of our agricultural population. His manners were urbane and hospitable; and his loss must be deeply felt by a most attached family, to whom we can offer only our most respectful and sincere condolence. We hope hereafter to be able to give a more extended notice of the life and character of this valuable man. H. C.

[Communicated.]

MR. BRACK—Please to publish the following contributions of exceedingly fine fruits, at the Exhibition of the Horticultural Society on the 25th ult., an account of which was omitted in the list sent for publication in your last, through the neglect of Messrs Knowlton & Towsant.

From E. Bartlett, Roxbury, one of the vice presidents; Pears—Napoleon, Roi de Wurtemberg, Calotte de Suisse, Andrews, Bartlett or William's Bon Chretien, Fulton, and Seckle.

from John A. Kenrick, Newton; Pears—Washington Andrews, Peacha—Belle de Vitry; and H. Johnson, Charlestown; Grapes—Chasselas T. Wheelwright, Newton; Apples—Washington Fruit Co., Lowell; Peaches—Dr. Holbrook; Plant—superior VOLUNTEER.

The Horticultural Report was received to late insertion this week.

RIGHTON MARKET.—MONDAY, Oct. 21, 1890. Reported for the New England Farmer.

Market 950 Beef Cattle, 1200 Stores, 4200 Sheep, 1630 Swine.

RICES.—Best Cattle.—We quote to correspond with week, about the same prices were obtained for a like quantity, viz. First quality, \$7 25 a \$7 75. Second quality, \$6 25 a \$6 75. Third quality, \$5 00 a \$5 75.

Wool.—Former prices were not sustained and sales made at prices rather lower than last week. We quote Yearlings \$11 a \$14. Two Year Old \$16 a \$27. One and a Half Years \$18 a \$20. Three Year Old \$20 a \$25. Four Year Old \$25 a \$30. Five Year Old \$30 a \$35. Six Year Old \$35 a \$40. Seven Year Old \$40 a \$45. Eight Year Old \$45 a \$50. Nine Year Old \$50 a \$55. Ten Year Old \$55 a \$60. Eleven Year Old \$60 a \$65. Twelve Year Old \$65 a \$70. Thirteen Year Old \$70 a \$75. Fourteen Year Old \$75 a \$80. Fifteen Year Old \$80 a \$85. Sixteen Year Old \$85 a \$90. Seventeen Year Old \$90 a \$95. Eighteen Year Old \$95 a \$100. Nineteen Year Old \$100 a \$105. Twenty Year Old \$105 a \$110.

Wool.—Former prices were not sustained and sales made at prices rather lower than last week. We quote Yearlings \$11 a \$14. Two Year Old \$16 a \$27. One and a Half Years \$18 a \$20. Three Year Old \$20 a \$25. Four Year Old \$25 a \$30. Five Year Old \$30 a \$35. Six Year Old \$35 a \$40. Seven Year Old \$40 a \$45. Eight Year Old \$45 a \$50. Nine Year Old \$50 a \$55. Ten Year Old \$55 a \$60. Eleven Year Old \$60 a \$65. Twelve Year Old \$65 a \$70. Thirteen Year Old \$70 a \$75. Fourteen Year Old \$75 a \$80. Fifteen Year Old \$80 a \$85. Sixteen Year Old \$85 a \$90. Seventeen Year Old \$90 a \$95. Eighteen Year Old \$95 a \$100. Nineteen Year Old \$100 a \$105. Twenty Year Old \$105 a \$110.

Wool.—Former prices were not sustained and sales made at prices rather lower than last week. We quote Yearlings \$11 a \$14. Two Year Old \$16 a \$27. One and a Half Years \$18 a \$20. Three Year Old \$20 a \$25. Four Year Old \$25 a \$30. Five Year Old \$30 a \$35. Six Year Old \$35 a \$40. Seven Year Old \$40 a \$45. Eight Year Old \$45 a \$50. Nine Year Old \$50 a \$55. SPLENDID BULBOS FLOWER ROOTS.

Just received by JOSEPH BRECK & CO., from Holland, a very large and well selected assortment of Dutch Bulbos Roots, among which are the following:—

HYACINTHS.—Double white, double white with red and purple eyes, double red, double red, dark blue, light blue and yellow, single white, white with red and purple eyes, rosy, pink, red, light and dark blue, yellow and variegated, comprising 150 varieties of choice named sorts.

TULIPS.—Fine late named sorts, fine double do., mixed single, mixed double, single and double Van Throff for forcing, Parrots, &c. &c.

CROUS IMPERIALES.—Double red and yellow, single red and yellow, striped leaves, &c.

POLYANTHUS NANCIES.—White, yellow, white with yellow and cotton cups, and cotton with yellow cups.

NARCISSES.—Orange Phoenix, Sulphur Phoenix, Incorporal Van Son, and Tetras cactus, with double flowers; Trumpet major, Sulphur and Poeticus, with single.

JOSQUILLUES.—Double and single.

RANUNCULUS.—Large double red and yellow Turkey, and other varieties.

ANEMONES.—Many fine mixed and named varieties.

IRIS.—English, Persian, Spanish and Sustaina.

CECROYS.—White, blue, purple, yellow, cloth of gold, striped, &c. 25 sorts.

GLADIOLUS.—Biantrum communis, with purple, red and white flowers; Cardinalis.

LILIES.—Double and single white, striped leaved, and spotted; Caledonic, Buliferum, Martigon, Kampschatkian, Aurantiaca, &c.

PEONIES.—Double white Chinese, double red do., double red and double white, double purple fringed, fennel-leaved, &c.

Also—Snow Drops, Amaryllis, Tuberoses, Ornithogolus of all sorts, Arum dracunculoides, Geranium tuberosum, Allium flavum, Hyacinthus monstrosus, plamosus, biotroides and Belgicus of sorts; Fritillarias, Cyclamens, &c.

The above choice collection of bulbs have been selected with much care, from one of the best houses in Holland, and are offered to purchasers with great confidence, believing they will give universal satisfaction to all who will give them a fair trial. Orders should be forwarded soon, to the subscriber, No. 52 North Market Street, office of the New England Farmer. A liberal discount will be made to dealers. October 23. JOSEPH BRECK & CO.

Fruit and Ornamental Trees, Flowering Shrubs, Plants, &c.

The present being the most favorable season for transplanting all hardy trees and shrubs, we would remind those who are in want of Fruit or Ornamental Trees, Shrubs, Herbaceous Plants, &c. that we can furnish them at short notice at nursery prices, well packed for transportation to any part of the country. JOSEPH BRECK & CO. October 15.

PEAR, PLUM, GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds; 1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;

500 Quince Trees; 3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pond's Seedling;

30,000 Giant Asparagus Roots; 5000 Wilmot's Early Rhubarb or Fie Plant, lately introduced;

Also—a good assortment of Gooseberries, Roses, &c. of different kinds;

All orders left at this office, or with the subscriber at Cambridgeport, or in Mr. Lynch's baggage wagon box, at Gould & Howe's, No. 8 Faneuil Hall, will meet with immediate attention. SAMUEL POND, Cambridgeport, Mass. October 9.

HOUSE IN DORCHESTER.

To let a large and convenient house, pleasantly situated in Dorchester, one third of a mile beyond Dr. Coolman's meeting house, and between five and six miles from Boston; together with 14½ acres of fine land, well stocked with fruit trees. There are good wells of water—a fine barn, chaise house, and corn barn, and convenient out buildings. The above affords a rare chance to some practical person wishing to carry on a farm; possession given immediately. Apply at this office. October 9.

ROHAN POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, at 45¢ per barrel. October 15. JOSEPH BRECK & CO.

WHOLESALE PRICES CURRENT.

Table listing various commodities and their prices. Columns include item name, unit, and price. Items listed include ASHES, BEANS, BEEF, BEEFWAX, BUTTER, CHEESE, CIDER, ROSE MASTURE, FEATHERS, FLOUR, GRAIN, HAM, HOPS, LEAD, LEATHER, LIME, MOLASSES, OIL, PLASTER, PORK, SEEDS, SOAP, TALLOW, and WOOL.

PEAR TREES.

For sale at the garden of the subscriber a large collection of Standard and Dwarf Pear Trees comprising most of the choice varieties of European and American origin. Orders by mail will be immediately answered. October 16. ROBERT MANNING.

MISCELLANEOUS.

"He live and learn," is a saying which every day verifies. Who has not seen and been pained at the cruel punishment inflicted on a horse, who taking what is called the 'studs,' refuses to move an inch forward, albeit he will 'back' more readily than is desired? Some time since a horse took the studs in one of our principal streets. He was, as the bystanders all agreed, remarkably stubborn. He was beaten, cruelly, unmercifully, and yet he would not go. He was coaxed and patted, but without effect—there was no 'go-along' in him. It was distressing to see how he was whipped—now over the head, now on the back, again on the knees; and every one was pleased, when a stranger, with a benevolent face and an intelligent eye, interfered.

"That is all wrong," he said, "you must not beat that horse any more." He has already been punished so severely.

"What are we to do then?" asked the drayman. "I have been here for two hours trying to get him along. Must I let the horse stand here all day?"

"No," replied the gentleman, "the horse must go along, but without any more punishment."

"But he won't," expostulated the drayman. "O yes, he will—he must. The horse, I say, must go. He has but a reasonable load, looks as if he is fed well, and he must go along."

"That is what I think," said the drayman.

"Very well, I have seen how they make jackasses move in South America, and they are reputed more stubborn than even horses. I shall, therefore, make this horse go. Now get me a rope about twice as long as the horse."

The rope was brought, and every body stood gaping, expecting, of course, that some locus-pocus was about to be performed. The gentleman directed the rope to be tied to the horse's tail, and passed between his legs out in front. He then took hold of it, and gave it a pull. The horse looked wild for an instant as if taken by surprise, and at the same time gave indications, by kicking behind, that he disliked the new mode of driving.—The rope was pulled strongly, and the horse with a very quick motion, started off. The triumph was complete; one square's driving in this way enabled him to return to the old mode, and the drayman drove off "amidst the shouts of the multitude."

"We live and learn," may well be said. Here, by a very plain and simple expedient, a horse was cured of the studs, but for the timely arrival of the strange gentleman, might have been the subject of cruel and continued punishment for hours longer. The cause of humanity gained by it, and there was also a positive gain of time, which is money.—*Baltimore Pat.*

Extraordinary Scene at an Execution at Athens.
—A scene which appears to have excited an extraordinary sensation, occurred in Athens at the commencement of August. The public executioner, of Lonia, had been sent for expressly to execute two brigades, who had been condemned to death, and so great is the horror of that officer in Athens that, although the government had taken the precaution to surround him with gen'darmes for his security, he fell a victim to assassination, previously to the intended execution. The government was much embarrassed for want of an executioner, when another criminal, on the promise of a free pardon for his offences, undertook the hateful office.

The guillotine could not, however, be found until after a lapse of many days. It was, however, set up at last, with the red flag waving over it, and early on the morning of the 5th of August, the two criminals were brought out to undergo their sentence: but the Procureur du Roi was not forthcoming to read it to them, which is legally necessary. A boy was, however, sent with the document after much delay, and got through it with tearful eyes. When the criminals were taken from the carriage in which they had been conveyed to the spot, no locksmith or tool had been provided for releasing them from their chains, and a considerable time elapsed in breaking the padlocks with stones, an immense crowd testifying its indignation at the torture of delay which was thus inflicted upon them.

The first victim having ascended the scaffold, it was found that the executioner was not only ignorant of the mode of using the guillotine, but that he was in a state of high nervous excitement. Mustering courage, at length he commenced his operations, but without success. The knife fell before the head was introduced. The criminal then entreated the troops to fire upon him, and the executioner, finding himself unable to perform the duty which he had undertaken, gave it up in despair.—No magistrate or other law officer being present to decide the course which was to be adopted, an adjutant set off at full gallop to Athens for orders.—He represented that the men had suffered more than the pangs of death. An hour and a half of cruel suspense occurred, when at length a detachment of horse, preceded by a white flag, arrived, and a shout was raised that the king had pardoned the offenders. This being found true, the criminals kissed the crucifix, the women who were present wept with joy, and the multitude rent the air with cries of "Glory to God and the king!" Every one praised this termination of a scene of such painful negligence, and the crowds returned home blessing their sovereign.

Travelling in the last Century.—The Boston Evening Post of April 6, 1761, publishes with great glee the following paragraph, giving notice of the great improvements which had been made, by a spirit of enterprise which always distinguished our ancestors, in the mode of travelling between Portsmouth and Boston:

"We learn from Portsmouth, New Hampshire, that for the encouragement of trade from that place to this town, a large stage chaise, with two good horses, well equipped, will be ready by Monday week next, to set out from thence to this place, to perform once a week; to lodge at Ipswich the first night; from thence through Salem and Medford to Charlestown ferry; to tarry at Charlestown till Thursday morning, so as to return to Portsmouth the next day, and set out again the Monday following,—that it will be contrived to carry four persons, the price to be 13—6 sterling."

It thus appears that a week was consumed by going in this fast vehicle, drawn by "two good horses," in going to Boston and returning. When the railroad is finished, a man will be able to visit this city from Portsmouth before breakfast, transact his business, and return to dinner.—*Merc. Jour.*

The population of Paris amounts to 1,200,000 souls, and that of London to 1,700,000—in both 2,900,000.

A FARMER WANTED.

A man and wife or a single man are wanted to carry on a Farm about 14 miles from Boston, for which reasonable wages will be paid. None need apply but Americans and those that are acquainted with Farming and Gardening. First rate recommendations will be required for honesty and sobriety. Please apply at this office.
September 25.

A Young Man Wanted on a Farm.

The advertiser is in want of a smart young man that is well acquainted with the cultivation of vegetables, and one that is also capable of taking charge of horses, cows, and sheep; one that understands it, he must be energetic, active and fond of neatness and order; he must produce evidence of a good moral character. Such a person may find a permanent situation by calling on Messrs BRECK & CO. No one need apply but such as answer to the above.
September 25. 181

WINSHIP'S BRIGHTON NURSERIES,
AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbage, Perennials, Green House Plants, &c.
Orders addressed to Messrs WINSHIP, Brighton, Mass. will be promptly executed, and forwarded to any part of this or other countries.
April 10.

Morus Multicaulis Trees from Seed.

The subscriber offers for sale 10,000 trees produced from seed of the genuine Morus Multicaulis. The seed was obtained on his premises in 1826. The trees so multiplied for the two last years by layers, their growth is more rapid than the original tree, and appear to be sufficiently acclimated to endure the winter, some of them having been left standing in the open field unprotected during the two last winters without any essential injury. The leaves are very large and equal in quality to any other kind for feeding the silk worm. Those who are wishing to purchase a superior kind of Mulberry are requested to call and examine for themselves, before the foliage is destroyed by frost.
CALVIN HASKELL.

Harvard, September 11.

MULBERRY TREES.

The subscriber has on hand a quantity of Mulberry Trees of a quality which is probably superior to any kind ever introduced into this country. They were imported four years since and though they have sustained the rigorous cold of the last three winters entirely unprotected, yet it is believed a Southern or Western climate would be more admirably adapted to their growth and propagation. Their foliage is most luxuriant and affords more nourishment than any other variety. Silk produced by worms fed with the leaves, has been pronounced superior to the best ever manufactured by them, and decidedly superior to the best Italian. A few thousand will be credited superior for sale. Immediate application is made to the subscriber, where specimens may be seen.

Also—A few hundred Morus Multicaulis and Asiatic.
JOHN N. BARBOUR,
September 11. No. 30 Commercial Street, Boston.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even his moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine, even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing are entitled to a deduction of 50 cents.

AGRICULTURAL.

WORCESTER CATTLE SHOW.

The annual festival of the Worcester Agricultural Society was held on Wednesday, Oct. 9. The exhibition of the people of the county was magnificent. It is estimated that more than 8000 persons assembled on the husbandman's holiday, principally our citizens. Many guests from abroad were present. The earliest train of cars on the Boston Road brought five hundred passengers; the cars of the Great Western Railway added many to the number of strangers.

The Massachusetts Society for Promoting Agriculture, was well represented by the Hon. John Ellis and Mr. Codman; Mr. Joseph Breck was the legate of the New England Farmer; Gov. Isaac Hill, a native of Worcester county, was present on New Hampshire; John G. Deane, Esq. attended for the associations of Maine; the societies of Connecticut were absent, and Rhode Island and Vermont omitted to report themselves in the meeting of the friends of agriculture.

The ploughing match on the field of Capt. Lewis Galloway, was first of the exercises, and is said to have been conducted in fine style. The teams were handsome and well trained, the ploughmen skillful, the implements made by Ruggles, Nourse & Mason, which is all that need be said of their quality, and the work done well and quick.

The religious exercises in the church were performed in an appropriate manner by the Rev. Mr. Sweetser, of Worcester, chaplain of the day.

Previous engagements with the most interesting all animals, prevented the editor from listening to the address delivered by Alfred D. Foster, Esq. It is said to have been distinguished for beauty of expression and sound and correct sentiment. The topics discussed, as we are informed, were of the merits of labor, the condition of the American farmer, the progress and improvement of agriculture, and the motives which should induce the young husbandman of New England to remain in his native land, where industry receives its just reward, and the moral, religious, and social institutions, afford means of happiness, instead of emigrating to a distant west.

At half past two, the members of the Society with their guests and many strangers, sat down to an excellent dinner, provided by Mr. Putnam, of the Central Hotel. The Hon. Levi Lincoln presided, assisted by the Hon. Edmund Cushing, of Lunenburg, and the Hon. Joseph Bowman, of New Braintree, Vice Presidents of the Society. The religious services at the table were appropriately and impressively performed by the Rev. Mr. Sweetser, of the Calvinist church. After thanks had been returned, the president rose and said, "that under the abundant causes for gratulation and enjoyment in the occasion, an event had reached his knowledge, the tidings of which could not but be received by an assembly of farmers and persons especially engaged in cultivating the products of the earth, with the deepest emotions of interest and mournful re-

gret. The papers of the morning bring intelligence of the decease of the Hon. JESSE BUEL, the distinguished, scientific, and eminently successful practical farmer of a neighboring state; and I have been advised," added the president, "that this time and place may be deemed the most appropriate to make to you the melancholy communication, and to invite from you an expression of the sentiments of grateful esteem with which you have regarded his labors in the cause of agriculture, and of the cherished respect in which you will hold the remembrance of his private and social virtues.

To Judge Buel, of Albany, more perhaps than to any other single individual, is the country indebted for an illustration of the influence of high intellectual powers upon the common and humble occupations of life. He afforded, in his own person, a bright example of the agency of learning and literary accomplishments to direct the hand and ameliorate the condition of labor. He was above nothing that was useful, and whether engaged in the investigation of the laws of nature, or in the application of discovered principles to practical results, he was alike the servant and the benefactor of the farmer. As a skillful *horticulturist*, he was no less eminent than as a successful *husbandman*; and the improved fruits of our gardens and orchards will annually hereafter bear witness in this department to the liberality and extensive influence of his exertions. He died in the midst of a life of the most active usefulness. Indeed, the inexorable messenger arrested him in the very pathway of his labors. He was on a journey from the place of his residence in the city of New Haven, on an occasion like that which we are now assembled to celebrate, there to instruct from the treasures of his reading, reflection, and experience, an agricultural association, and to participate in the festivities of the harvest home of the farmer, when he was himself suddenly gathered to the great harvest of mortality. It is not for me," continued the president, "to attempt his biography, or in this place, to speak of the many interesting relations which he had sustained, both as a public and private man, to society. The State of which he was a citizen, and the country to which his life was a blessing, will long and deeply deplore his loss. It is my purpose only, in simple and brief terms to announce his death, to give opportunity to a distinguished individual now present, who was personally and intimately acquainted with his worth, to offer in happier language, appropriate expressions of respect for his character and grief for his loss."

The Rev. Henry Colman, Agricultural Commissioner of the State, rose and remarked in substance, that in the tribute of respect and gratitude just paid by the president of the Society, to the character and distinguished merits of the late Judge Buel, he cordially sympathized. An eminently useful man had indeed fallen; one who ought justly to be regarded as an instructor and guide in the great work of agricultural improvement. To him the community is largely indebted for the teachings of an enlightened mind, operating upon the results of a broad experience in the application of human labor. Mr. Colman proceeded to pronounce a brief but beautiful eulogium upon

the beneficial influences of a life like that of Judge Buel, devoted to the original employment of man, in the culture of the earth. His writings, he said, were among the best practical treatises upon the subjects of husbandry and the raising and management of plants and trees, and now that his instructive labors were unexpectedly terminated, there could be in such an assembly as he was addressing, but one pervading sentiment of regret in the melancholy event. As expressive of this sentiment, he would beg leave to introduce the following resolutions:—

Resolved, That this meeting of Worcester and Massachusetts farmers have learnt this day with deep regret, the decease of Jesse Buel, Esq., of Albany.

Resolved, That the memory of Judge Buel should be cherished with the highest respect by the agricultural community through out the whole country, for the eminent zeal and intelligence with which he has devoted his distinguished talents to the cause of agricultural improvement, and contributed so largely to its advancement.

Resolved, That the Corresponding Secretary of the Worcester Agricultural Society, be requested to transmit these resolutions to his bereaved family, in testimony of their respectful condolence in this private and public calamity.

The resolutions having been read, were thereupon immediately and unanimously adopted.

The following sentiments, among others, prepared for the occasion, were successively announced from the chair:

Tilling the Earth.—An employment of man in paradise—it brings with it still, the cheerfulness of health and the happiness of content, and raises him to the dignity of true independence.

Education of the Young.—The culture of a virgin soil—if sowed with good seed, the harvest richly repays the labor; if left fallow, noxious weeds alone spring up in baleful profusion.

Agriculture, Commerce and Manufactures.—An honest old trading firm; always successful when true to each other. May there be no dissolution of copartnership by mutual consent.

The National Team of twenty-six strong.—Whoever drives or whoever holds—may there be no shoving or goading; no getting over the traces and no breaking the chain.

Cure for hard times.—Cheat the doctor by being temperate; cheat the lawyer by keeping out of debt; and cheat the demagogue, of whatever party, by voting for honest men.

Morus Multicaulis.—A tough name for a tender tree. Though it has worm'd itself into the affections of so many, may they never find themselves bit by a caterpillar, nor see their hopes fly away on the wings of a butterfly.

The Plough.—The great instrument of human subsistence; the pioneer of civilization; the true foundation of national wealth. Speed the plough.

The president remarked, that in announcing the last sentiment, which referred to the "instrument" by which we subdued the earth, his eye was arrested

ed by one whose person reminded him of another sort of *instrumtality*, by which conquests scarcely less important had been achieved upon a different element. In the sentiment he would now announce, he should have the pleasure of presenting to the attention of the company an honored guest, the gallant Captain Babbitt, of the Navy. He then gave

The Navy of the United States.—In celebrating this rural festival, may we not be unamfidal, that if *seeds of wealth* may successfully be sown on the *furrows of the earth*, *harvests of glory* have been garnered up from the *billows of the ocean*.

This sentiment was received with hearty and prolonged cheers, and was acknowledged by Capt. Babbitt, but we regret, in so low a tone of voice as to have been too imperfectly heard to be reported.

In allusion to the liberality of the Massachusetts Society for the Promotion of Agriculture, which had united with the County Society in the offer of premiums on this occasion, and to the Hon. John Welles, one of the Trustees of the State Society, who had greatly enriched the Show by the gratuitous exhibition of several beautiful animals from his fine herd, the following sentiment was announced from the chair:

The Massachusetts Society for the Promotion of Agriculture.—They not only send here their funds, as *premiums* to encourage the raising of *good stock*, but their officers bring with them the *best specimens* to show us what it is they mean to encourage.

Mr Welles responded in a few remarks upon the excellency of the Show, and gave the following sentiment:

The Agriculturists of Worcester.—Their splendid Fair, and their Show, this day exhibited *here*—with a due homage to the *Fair* elsewhere, and the *Show* which beautifies the whole face of the country.

Mr Codman, also one of the Board of Trustees of the Massachusetts Society, gave an apt sentiment highly complimentary to the County Society.

Mr John Lane Boylston, gave—

The City of Boston.—May the iron links which unite us in friendship, never be broken by discord.

Mr Colman, the Agricultural Commissioner, and Mr Foster, the orator of the day, were happy in their responses to personal complimentary allusions, which called them out, but the haste in leaving the table, occasioned by the announcement of the exhibition of the great Sutton team, prevented obtaining copies of their sentiments. Several other gentlemen offered toasts, which we have not been able to collect.

His Excellency Governor Everett, who had been invited to attend, accompanied his expression of regret that previous engagements denied him the gratification, with the following sentiment:

The County of Worcester.—Rich in the fertility of her soil—richer in the character of her citizens: her prosperity is essential to that of the Commonwealth.

The company retired from the table to inspect the long train of seventy-four yokes of fine oxen, exhibited by the good farmers of the town of Sutton. The interesting character of this, as indeed of every other part of the Show, will be best seen, by the reports of the appropriate committees.

The committees have always been formed of practical men, skilled and experienced in the manufactures and stock assigned for their examination. The chairman has been selected with reference to the convenience and facility of presenting to the Society, in the few hours allowed for the discharge

of the duty, a report of the decisions. By the regulations of the trustees, he is not permitted to vote in awarding premiums or gratuities, except when members stand equally divided. The reporting officers, this year, were prevented, by the unanimity of the committees, from exercising the right of suffrage.

The following abstract of the premiums awarded, excepting those mentioned in the printed reports, will furnish acceptable information to successful competitors.—*National Egis*.

Ploughing with Double Teams.

Leonard Wheelock, Grafton, first premium	\$10
Reuben Wheelock, Sutton, second	7
Artemas Ward, 2d, Worcester, third	5
Stephen Marsh, Sutton, fourth	3

Milch Cows and Fat Cattle.

L. & E. Barnard, Worcester, fat ox, 2252 lbs.	\$20
Jedediah Estabrook, Rutland, second premium	15
Gardner Wilson, Leicester, third	10
Jacob Stevens, Charlton, best milch cow	10
Elijah Darling, Princeton, second	8
Reuben Barton, Milbury, third	8
Wm. Eames, Worcester, fourth	5

Working Oxen.

Daniel Tenney, Sutton, first premium	\$12
Stephen Marsh, Sutton, second	10
David W. Carpenter, Charlton, third	8
Elbridge G. Wheelock, Milbury, fourth	5
74 yokes of oxen, Sutton, team	75
David Carpenter, Charlton, team	5
Simon Carpenter, Charlton, team	5

Steers.

Abel Flagg and sons, Worcester, best 3 yrs old	\$8
Harvey Dodge, Sutton, second	6
Reuben Wheelock, Sutton, third	4
Elijah L. Case, Grafton, best 2 yrs old	6
John McLallen, Sutton, second	4
Lewis Abbott, Brookfield, third	3
Alpheus Davis, Charlton, best yearling	5
Horatio Gates, Worcester, second	3

Other Veal Stock.

Nathan Brooks, Bolton, best bull	\$12
Orsenus Willard, Harvard, second	8
Thomas W. Ward, Shrewsbury, third	6
Joseph Sawyer, Bolton, best bull calf	6
Timothy P. Moore, Worcester, second	2
Reuben Wilder, Westboro', third	2
Orsenus Willard, Westboro', best yearling heifer	5
Adam Harrington, Shrewsbury, second	4
Elijah L. Case, Grafton, third	2
Jonas H. Allen, Shrewsbury, best 2 yr. old heifer	6
Ephraim Drury, Worcester, second	3
Moses Gill, Princeton, third	3
Asa Rice, West Boylston, best 3 yrs old heifer	6
Bentley Stockwell, Sutton, second	4
Peter Stockwell, Sutton, 2 yrs old	5
Solomon Hathaway, Grafton, best heifer calf	5
Henry Snow, Shrewsbury, second	4
John Whitney, Princeton, third	2

State Society's Premiums.

Nathan Brooks, Princeton, best bull	\$50
Orsenus Willard, Harvard, next best	30

Sheep.

Thomas W. Ward, Shrewsbury, best Merino ram	\$7
F. Strong and C. Hadwin, Worcester, best Merino ewes	8
William Thomson, Oakham, second	4

Thomas W. Ward, Shrewsbury, mixed Merino ewes

Hollon Maynard, Northboro', best native ram
Daniel Tenney, Sutton, best native ewes
John Whitney, Princeton, best native wethers

Swine.

Samuel A. Knox, Grafton, best Berkshire boar
Peter Fay, Southboro', next best
Shaker Society, Harvard, Berkshire boar
Eden Davis, Webster, " "
Marvin Wesson, Templeton, Miller's breed
Harvey Dodge, Sutton, best weaned pigs
William Eaton, Worcester, next best
Eliazer Porter, " best sow
Harvey Dodge, Sutton, next best

State Society's Premiums.

James T. Clapp, Belchertown, Berkshire boar \$1
Samuel A. Knox, Grafton " " 1

Butter and Cheese.

Job Rainger, New Braintree, best Cheese less than one year old \$1
Welcome Newhall, New Braintree, second
Lorenzo Converse, New Braintree, third
Alexander G. Rich, Warren, fourth
John Matthews, New Braintree, best old cheese
Job Rainger, New Braintree, second
Isaac Stone, Shrewsbury, best butter
Ous Longley, Boylston, second
Luther Chamberlain, Westboro', third
George N. Sibley, Grafton, fourth

Flowers, Fruits and Vegetables.

Flowers, Edmund F. Dixie, Worcester.
Mrs A. D. Foster, " "
Apples, Leonard Harrington, Shrewsbury,
Jonathan Nye, New Braintree.
Blood beets, Edmund F. Dixie, Worcester.
Sugar beets, Charles Warren, "
Onions, Samuel A. Knox, Grafton.
Potatoes, Eden Davis, Webster.
Summer squashes, Bezaleel Taft, Uxbridge.
Citron pumpkin, Miss Everett, Worcester.
Winter squashes, J. Puffer, Leominster.
Hiram Brown, Worcester.
Robert Rogerson, Uxbridge.

N. E. pumpkin, John D. Sargent, Leicester.
French pumpkin, Francis T. Merrick, Worcester
The premiums awarded to each are equal: the want of funds unfortunately rendered them trifling in amount.

CATTLE SHOW.

The Bristol County Agricultural Society held their annual Fair and Show in this town on Wednesday last. It was a great falling off from previous years, and on the whole, rather a meagre affair. Few animals only were exhibited, or anything else, to give interest to the occasion. There were a great many people in town to witness the exhibition, who expressed much disappointment. We give below a list of all the premiums awarded which are copied from the Reports of the various committees.—*Taunton Dem.*

Ploughing Match.

The whole number of teams entered for this purpose was twelve—eight of these were entered within the time prescribed by the Society—four only the eight ploughed; to these premiums were awarded as follows:

To Luther L. Short	\$7
Oliver Dean	6

Samuel A. Dean,	5 00
Peyton R. Leonard	4 00
<i>Domestic Animals.</i>	
Amos W. Dean, for the best fat ox	\$8 00
Bernard Alger, for the 2d best do	6 00
Amos W. Dean, for the 3d best do	4 00
Jacob Dean, for the best bull	8 00
" " for the 3d best do	3 00
Peyton R. Leonard, for the 3 best milch cows, 2d premium	3 00
George B. Atwood, for best milch cow	4 00
George A. Crocker, for 2d best do	2 00
Daniel Brewer, for best yearling heifer	4 00
Bernard Alger, for 2d best do	3 00
Elbridge Dean, for 3d best do	2 00
Peyton R. Leonard, for 6 best Merino ewes	3 00
Simcoe Leonard, for best boar	3 00
Samuel A. Dean, for 2d best do	2 00
Simcoe Leonard, for best sow	3 00

The sum of two dollars was awarded to Jacob Shepard, for a boar.
 Many animals were presented for premiums which had not been entered agreeably to the rules and regulations of the Society, which require that "all stock offered for premium shall be entered on or before the Saturday previous to the day of exhibition." The committee did not consider themselves authorized to award premiums to any stock entered on Saturday last.

<i>Butter, Cheese and Honey.</i>	
Alvarus Caswell, best tub of butter	\$8 00
Peyton R. Leonard, second best	6 00
John Arnold, Jr., best lot of cheese	8 00
Paddock Dean, second best	6 00
David Arnold, third do	4 00
Jacob Bayley, best and only lot of honey	4 00

<i>Fruit and Vegetables.</i>	
Jacob Dean, for the best apples for family use	\$4 00
G. G. Cobb, for squashes	2 00
Cassander Williams, do	1 00
Abel Bliss, for a basket of fine corn	2 00
Abigail Bliss, jr., lot of Rohan potatoes	2 00
Stanley S. Garge, do do	1 00
S. B. Braman, for a lot of fine citrons	1 00

Reproduction of Fruit.—It is said that apples, pears, peaches, and various other fruits will not produce their like from the seed. May not this arise from the fact of various kinds of each sort being grafted together, the farina of the one is carried by the industrious bee to the other, and a hybrid produced? Would it not be worthy of a trial, to take or instance the stone of a peach remotely situated from any other of the species, and see whether it would not produce its like? We believe it would, and if so, many diseases which proceed from grafting and budding might be avoided. This will, we are sure, be an unpopular doctrine with many, but believing it correct, we hesitate not to advance it.—*Farm. & Gardener.*

One of the best plans for keeping potatoes in cellars, is to construct a bin, put sand in the bottom, line the sides and ends with smooth and handsomely cut sods, and when the potatoes are put in, cover them with sods and beat them down closely. In this way, all the above requisites may be obtained. Potatoes intended for constant family use, may be kept temporarily in barrels, and covered with sand.
Genesee Fur.

MASSACHUSETTS HORTICULTURAL SOCIETY.

At a meeting of the Society, October 5th, 1839, it was

Resolved, That the thanks of the Society be presented to the Committee of Arrangements, for their acceptable services in arranging and fitting up the Hall of the Society for its late annual exhibition.

Resolved, That the thanks of the Society be also presented to all those persons who so liberally contributed flowers, fruits and vegetables to the late annual exhibition.

Mr Josiah Lovett, 21, of Beverly, was elected an immediate member of the Society.

The Society then proceeded to ballot for officers for the ensuing year, and the following persons were elected—(Messrs Vice Presidents Bartlett and Prince having declined a re-election.)

President—ELIJAH VOSE, of Dorchester.

Vice Presidents—Jonathan Winship, of Brighton, Marshal P. Wilder, of Dorchester, Benj. V. French, of Braintree, William Oliver, of Dorchester.

Treasurer—Samuel Walker, of Roxbury.

Recording Secretary—Edward M. Richards, of Dedham.

Corresponding Secretary—Robert T. Paine, of Boston.

Counsellors—Samuel Downer, Augustus Aspinwall, Thomas Brewer, Henry A. Breed, Joseph S. Cabot, E. Hersey Derby, N. Morton Davis, David Haggerston, Joseph G. Joy, William Kenrick, John Lemist, William Lincoln, Thomas Lee, Charles Lawrence, Benj. Rodman, M. P. Sawyer, Charles Tappan, Aaron D. Williams, Jonathan Winship, William Worthington, Thomas Whitmarsh.

Professor of Botany and Vegetable Physiology—John Lewis Russell, of Salem.

Professor of Entomology—T. W. Harris, of Cambridge.

Professor of Horticultural Chemistry—Samuel L. Dana, of Lowell.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Oct. 12, 1839.

Mr Wilder exhibited the monstrous Pomme Peach, this is the "Pavie de Pomponc" of the London Horticultural Society's Catalogue. Mr Thompson remarks, that it will not ripen except in a warm season and good situation.

Mr Oliver exhibited large and beautiful specimens of the Urbanite Pear: they fully sustain their former high character.

Mrs Jones exhibited a basket of fine Peaches from her garden, No. 14 Friend street, Boston.

Mr Emerton, of Salem, exhibited the Surpass Vergoulose and Capsheaf Pear: these were most superior specimens, and produced a very favorable opinion of their value.

Mr Walker exhibited a basket of Plums, unnamed: as this variety appears to be valuable from its size, beauty, and late ripening, it is intended further to investigate its name and origin.

Mr Lowell exhibited the following Pears, viz. Grande Bretagne, Glout Moreau, (from Mr Parmenter) Reine Caroline, Delices Hardenpont, Delices Charles, and Beurre Bronze: the Reine Caroline was the only one at maturity, and was judged to be a very fine fruit.

Mr Guild exhibited the following Grapes, viz. Laabella, Black Hamburg and Sweetwater, the two last were the produce of vines cultivated in the open ground—they were pronounced equal if not superior to any grapes of the same sort and same cultivation exhibited this season.

Mr Manning exhibited the following apples, viz. Boxford, Killam Hill, Lyscom, and Ribstone Pippin—for a particular description of these apples we refer to Mr Kenrick's New American Orchardist.

The following Pears from the collection provided by the Society, were examined to-day, viz: Wilkinson, Beurre Bronze and Duchess de Angouleme. We do not find the Beurre Bronze described by any Pomological author: it is not even named in the second edition of the London Horticultural Society's Catalogue; its color however, is a sure indication that the name is correct: it is a large and good fruit, and well deserves to be extensively disseminated.

For the Committee,
 ROBERT MANNING.

Deciduous trees, that is, trees which shed their leaves in autumn, may be transplanted with safety, when they are not in a growing state, that is, at any time after the functions of the leaves have been arrested by frost in autumn, and before they come into leaf in the spring. If planted in autumn, in a high northern latitude, it is well to throw around the tree a shovelfull of dung, to protect the roots from the cold of winter.—*Cultivator.*

Great Field.—Dr Fuller, of the Connecticut Retreat, raised this season, from one Rohan potato weighing 4 oz., ninety-six pounds five ounces!

From the Farmer's Cabinet.

DIALOGUE BETWEEN FATHER AND SON.

PART I.

Supposed conversation between a provident and improvident farmer, and their respective crops and stocks &c.

Father.—Father, which is the most profitable breed of sheep for the farmer? I should suppose the largest, as a sheep is a sheep you know, and a large one is of more value than a small one.

Father.—A prudent man will advise with his land on that subject.

Father.—But can his land advise with him?

Father.—Yes, and the lessons which a farmer is taught by his land, are not soon forgotten, as, according to the old adage, "bought wit is best." I sometimes fancy that my crops converse with me, when I visit them of an evening, and if I could do justice to those fancied dialogues which I seem to hear, and could commit them to paper, they would, I think, make a pleasant addition to your book.

Father.—O, do try—"nothing is impossible to a willing mind," you know.

Father.—Most opportunely quoted the text—for the SERMON.

We will suppose then, that a slovenly *procrastinator* is visiting his fields on just such a glorious evening as the present, in just such a fruitful season as we are now blest with. He goes up to the field, No. 1, which is wheat, and begins—

Grabb.—Good evening; fine weather this; but I don't think you look quite so well as you did the last time I visited you.

Wheat.—I wonder how I should—do you not see how I am choked with weeds? how the thistles are *gouging* me with their spikes, and the rag weeds are taking the food out of my mouth, while the bind weeds are dragging me down to the earth; and how that I am smothered with evils innumerable?

Grabb.—But I allowed you a fallow and plenty of manure; you ought at least to have been able to cope with the weeds.

Wheat.—You forget that "the earth is own mother to the weeds, while she is only mother-in-law to the crops that are planted in her bosom;" besides, you talk of a fallow—why this great thistle on my right, and which has one of its spikes fixed in my side, has just informed me that he is one of the progeny which was reared in this same fellow of yours,—his parent being the identical thistle under which the farmer sat on horseback and escaped a drenching, while his neighbors were wet to the skin! You seem to have forgotten that "one year's seeding is seven years' weeding."

Grabb.—Ah well! I'll get these weeds pulled.

Wheat.—As you said a month ago, and will say again, and never do it.

Father.—Excellent! But you never fallow or dung for wheat.

Father.—Nor have I ever such fine thistles. I always dung for green crops, and insure two things at the same time—more food for the cattle, and of course, larger dunghills. My object is, to retard the growth of the wheat, that it might be strong in the stalk, and I therefore do not encourage its lavish growth by manure and fallow. Now for No. 2.

Grabb.—Why you look very sickly; I thought you would do better, judging from the appearance you put on at first coming up—how's this?

Corn.—Ask yourself! You thought you were cheating me, when you sowed without manure—a favor you always promised me; I relied upon that promise and came up, with the expectation that I should find it when I needed it; but after sending my roots below in search for it, I find your promises are false—you complain of my sickly look! I can only say, if you had no more to feed upon than I have, you would not have shelled the three lower buttons on your waistcoat! Grabb tucked the slacks into the holes, and walked on.

Father.—I now find that crops can advise and admonish too; but could not the farmer still do something in the way of top dressing, to remedy a part of the evil?

Father.—Yes; but he had no manure.

Barley.—Ah! you'll come to nothing.

Barley.—I thank you, and return the compliment. But what did you expect when you sowed me after once ploughing, on a stiff and wet soil? "Nothing venture, nothing have." I only wish that you had to work so hard as I have for a living. You would then feel for me.

Oats.—Well, I think you might do a little better than you do, if you would try; why, I shall not get the value of the seed back—that's too bad!

Oats.—Now that's thrice bad of you! You know that you have had six grain crops in succession from the land on which I am sown, with not a spadeful of manure of any kind for the last six years! Why, even the weeds have been starved out, and you have put in practice the lazy farmer's recipe for ridding his land of weeds—"make it so poor that they will not grow." Now that's practical farming without theory.

Grabb.—But what shall I do for want of the straw which I depended upon as fodder for the cattle during next winter?

Oats.—Is that all your dependence for the next winter? Why your cattle will be ready to eat you! and you will have to practise the other part of the recipe, "to prevent cattle from dying of starvation—kill them." But I give you warning; neither they nor you must expect any thing from me; if I can hold my own, 'twill be as much as I shall do.

No. 5. Clover.—Why you look healthy and well, but how is it that you have made so little progress in height? There's Farmer Sykes' clover as high as my knees, and will be soon fit for the scythe; but I am unfortunate in every thing.

Clover.—That's a true word, although it is not spoken in jest. Why you seem to forget that as soon as I had made a little progress in growth, you turned in all your starving cattle, horses and sheep, which not only eat up the branch, but also the root.

Grabb.—Ah! that I was compelled to do to keep them from starving; but you had all the benefit of their manure while they were feeding you.

Clover.—You call that manure? why it was, the greatest part, nothing but worms and bots—and the little good that remained was soon carried off by the grasshoppers and bugs, which were about as much in want of it as I! My fear is, that the hot weather which seems now to be setting in, will scorch the land, so unprotected by foliage, and dry up the scanty crop which is left, before it is high enough for the scythe—and then, what do you think your horses will say to you? If you had done as Farmer Sykes did, you would have deserved his success; you must remember that instead of feeding off his young crop, he top-dressed it with

a compost of lime, earth and dung, which had been carefully prepared in the winter, and well pulverized; by which, not only his present crop is doubly benefited, but it is also preparatory to an autumn sowing of wheat on the lay. Now put this all that together, and calculate the result. First, try tons of hay per acre, the first cutting; one ton per acre the second, with a capital aftermath for the dairy; and if wheat is sown by the 20th of September, a yield of forty bushels per acre might be expected at next year's harvest; and this is not all, for after the wheat is carried, the land will be tilled, and the clover stubbed perfectly rotted, will form an excellent seed bed for buckwheat, with an expectation of a heavy crop. Now I will leave you to calculate the value of my second crop, (remember you have already had the first cutting, and a severe cutting it was,) and of course you do not expect much at the third; while seventeen bushels wheat per acre next harvest, will be quite as much as you have any right to expect; and common justice will not allow you to sow buckwheat after.

Grabb.—Why, you are one of Job's comforters. *Clover.*—But I cannot see that you have a claim to the character of Job—for "In all this Job sinned not," remember.

No. 6. Potatoes.—Well, I don't know how it is, but while others are digging new potatoes, it does not appear that I shall ever have a one to dig! I think I may as well leave you to your fate, for you'll certainly never be worth the labor of cleaning.

Potatoes.—Now you cannot be ignorant of the fact, that for two months after the crops of other were up, you were only *talking* of planting yours; and all the while the weeds were growing on, and you called your fallow, until some of them were high as your head and full of seed; we were then tumbled in all together, and have ever since been striving for the mastery; but you have now sealed our fate, and must take the consequences. 'Twas fortunate for you, was it not? that your father lived before you, for he would find it difficult to live after you!

No. 7. The Cows in pasture.—Well, you have more grass than you can eat—however you can't grumble—that's one comfort.

Cows.—Grass, do you call it?

Grabb.—Yes, I do—and what do you call it?

Cows.—Why, we were just saying it would puzzle a Philadelphia lawyer to say what it is; but judging by the smell as well as the taste, it might be called garlic, without offending against the statute of truth.

Grabb.—Well, you are all alike! Didn't I see you feed off the crop of clover, almost before it was out of the ground?

Cows.—That's fact! Indeed we were at it, obliged to dig for it, and you will feel the effect next winter, or we are no conjurers.

Grabb.—Ah, I had need be a conjurer to know how to satisfy you all: but what have you done with the sheep?

Cows.—What, these large bodied, long wool animals, for which you gave in exchange your small breed, which, *even they*, could only just keep body and soul together, by picking the short herbbage of the pasture? Oh! we have done nothing with them, but they have at last been able to *something for themselves*, for finding it impossible to subsist on such short commons, and that they were growing less every day, they sought for a hole in the fence, and by waiting until they were reduced

much in size as to be able to creep through, or at length passed into your wheat, with the intention of returning after they had filled themselves, at this they could not do then, and it is not probable that they have attempted it since, so you had better look for them, for ere this, they have cost you as much as they are worth, in the damage they have done to the wheat crop.

Grabb.—Well, 'tis no use to try to do any thing else, and so I'll go straight home—no, not straight, for if I do, I shall get amongst the porkers, and they are grumblers by profession.

9. Pigs.—Porkers, did you call us? "Twill be long before we have any pork about us, with our present mode of living—call us *grunters*, for so we are, and with reason; we wonder you are not afraid to meet us after dark, for we are but the ghosts of things that have been. There is this consolation in it, however—our lives will be spared, for we shall never be worth the trouble of killing; indeed, at last in a little time would be no murder, as it could be like one of your neighbors, who killed his pigs to save their lives!

10. Grabb.—Ah! well, here come the horses; they are the only generous animals upon a farm; at where are ye all going in such a hurry?

Horses.—We have come at last to the resolution no longer starving quietly, so we are going in a body to break over the fence into Farmer Clement's lover; we know where the weak place is, for we have heard you promise for the last three months to let it mended, and of course it is not done yet. We do not intend to break into your own clover, as that would be punishing ourselves the next winter, for we calculate there will not be more food than enough for us all, if we eat stock and block of the whole farm.

By this time the farmer had reached his house, and going in, said to himself, there is no comfort out of doors, let us see if we can get a little within. Wife, bring the rum bottle and a pipe. Talk of the independence of a farmer's life, indeed! 'tis all hum—here am I, with the best intentions in the world—

Wife.—Not the value of a cent! all your intentions never grow into actions! Now just sit down and I'll sum up the thousand and one promises that you have made me to do the necessary repairs about the house—and to begin with the roof of the dairy, which was stripped off by that storm last autumn, and there it remains in the same state to this day.

Grabb.—Take care, let me get to bed, out of the way.

Frank.—Oh! thank you; but now, to make a perfect picture, we should visit his fields with a good farmer and husbandman.

Father.—I had indeed would be much more agreeable, and some day we may do so; but it is now late—let us get to bed, as Grabb said, but not for the same reason, blessed be God!

[Part II. next week.]

CRUELTY TO ANIMALS.

MR EDITOR—It is gratifying to observe that you have improved the advantageous position you occupy as the conductor of a public paper, extensively read among the moral people of New England, in administering reasonable advice regarding the wanton destruction of useful birds; and the same feeling will doubtless prompt you, in good time, to add remarks against cruelty to animals in general. This sin, so utterly revolting to the feel-

ings of the benevolent mind, and, moreover, so completely calculated to make men ashamed of some of their species, will doubtless be practised so long as our race cover the face of the earth; and hence the necessity that all whose conspicuous stations in life give importance to their advice and personal example, should constantly strive to inculcate the humane usage of all those creatures which a beneficent Providence has placed in the keeping of man, for his convenience and support.

I did not, however, take my pen for the purpose of writing an essay upon this subject; for kindness to animals is a duty which needs no argument to commend itself to every rational being. The mass of mankind, sensible that for wise purposes, the "beasts of the field and the fowls of the air" are committed to their guardianship, feel no other than kindly emotions in all their usage of them. Most descriptions of cruelty, too, wherever it comes under observation, is the result of sheer barbarity—the evidence of unmerciful feelings on the part of those who inflict it: but we have reached a season of the year when a kind of cruelty is practised, which, although very common, is rather the result of custom than of a wish improperly to use the lesser order of created things; and therefore can more easily be brought into disuse. I allude to the practice of exposing the various feathered tribes to the ball of the "sportsman," and permitting them to be fired at for given sums per shot: a practice involving the sin of gambling, and evincing cowardly and barbarous conduct too on the part of those who engage in it. It is as old, perhaps, as New England thanksgivings; but old as it is, it would be infinitely "more honored in the breach than in the observance;" and it is to be devoutly hoped will soon be laid aside, and considered as disreputable as racing, gambling and cock-fighting.

I imagine, Mr Editor, that the way to overcome all kinds of unnecessary destruction of innoxious birds, as well as a propensity to inflict cruelty upon domestic animals, is to enact no laws upon the subject, but to spread abroad a salutary influence in the community by persuasive means. Parents should inculcate upon their children principles of benevolence, and visit with the severest displeasure, any breach of their known wishes upon this subject. They should teach their offspring that an Almighty Power, without whose knowledge "not a sparrow falleth to the ground," for wise purposes, filled the earth with animals to minister to their convenience; and that to give them unnecessary pain, and for no useful purpose, is exerting a power which will mar their happiness, and which they have no right to exert.

The writer has reason to believe that the following anecdote, read to one of his children, will not soon be effaced from the mind of the child, or cease to exert thereon a correct influence.

"An idle youth, living upon the banks of the Loire, rowed his boat to the centre of the river, and then, for the purpose of drowning him, plunged therein his Newfoundland dog. The animal, upon every attempt to regain the boat, had his head borne beneath the waves by a paddle in the hands of his destroyer; but by reason of the strength for which that species of the canine race are so celebrated, was enabled successfully to maintain himself above the surface of the water. Finding his efforts to regain the boat unavailing, he turned for the shore, when his brutal companion, in making a renewed attempt upon him, lost his balance, and was precip-

itated within the waters. In this dilemma, when human aid was beyond reach, and when his bullettings would soon have been succeeded by the gurglings which precede dissolution, the dog with capacious jaws seized his arm, and brought him alive to dry land."—*Farmer's Monthly Visitor*.

ROHAN POTATOES.—The rage among cultivators for the Rohan potato, has in some parts of the country been more violent and it is believed much more useful, than the rage for speculation in *Morus Multicaulis*. The current price during the last planting season, was something like \$20 per bushel. The distinguishing trait of the Rohan is the remarkable abundance with which it produces. A writer in an English agricultural paper states, that in 1837, he raised from sixty moderate sized Rohans, planted under trees, and injured to a considerable extent by drought, twentyfour bushels full measure. In France, these potatoes frequently attain the weight of ten pounds. When cooked they are said to possess a fine flavor, and from the abundance with which they yield, and the consequent cheapness with which they are raised, they will, probably, when generally introduced, furnish an excellent substitute for the common potato, for the purpose of fattening hogs and beef cattle.—*Coos County Democrat*.

GREAT YIELD OF ROHAN POTATOES.—Mr Stephen Ordway, of Loudon, happening to be in Concord on one of the last days of May, at the store of Maj. M'Daniel saw some remnants of Rohan potatoes which had been kept for sale. He was told they had sold at seventeen cents the pound, and he paid two cents for one small potato weighing two ounces. This he took home with him, and cut it into seven pieces, which he planted in four hills—two in three hills, and the smallest eye of all in a hill by itself. The ground on which these hills were planted was in a spot of hard pan which had not been manured for three years. It was near his house, where early potatoes had been planted, which had already made their appearance above ground at the time. Mr Ordway dug the product of his potato on the 21st September, the vines being still green; and this weighed seventeen pounds, or one hundred and thirtysix for one. The largest potato weighed one pound and fourteen ounces, and several weighed from one pound to one and three-fourths pounds.

From a single Rohan potato sent to the editor of the *Farmer's Monthly Visitor* from Boston, having eighteen eyelets, was raised full three pecks in measure, weighing thirtyfour and a half pounds, and one hundred and eightyfour in number. One hill was entirely eaten by mice, and serious depredations were made in some others. The weight of the seed potato did not exceed four ounces. The largest potato weighed two pounds.—*Farmer's Monthly Visitor*.

THE ROHANS.—A gentleman in this village [Augusta, Maine,] planted last spring a Rohan potato weighing six ounces, which he cut in twentytwo pieces, and put two pieces in a hill. He dug them on Wednesday, and found the yield of his potato to be 148, which weighed sixty-six pounds, and measured five pecks. Another gentleman raised 100 potatoes, weighing fortythree pounds, from a Rohan of about the same size and planted in the same manner.—*Kennebec Gaz.*

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, OCTOBER 30, 1839.

CATTLE SHOW OF THE PLYMOUTH AGRICULTURAL SOCIETY.

This rural festival was holden at Bridgewater on the 16th inst. The day was fine and the attendance very numerous. As far as our own personal observation extends, these shows are fast growing into favor. When a vigilant police is exercised, which the laws of the State respecting cattle shows put it in the power of the managers to command at pleasure, there are certainly no less objectionable occasions of recreation; none which excite a more innocent and salutary emulation; and none which tend more to the cultivation of good fellowship and neighborhood. Political meetings and religious meetings, as things are among us, are necessarily party meetings, and not infrequently, whatever good may come from them, call up and encourage feelings and sentiments which, to say the least, it were better should remain dormant: temperance meetings, abolition meetings, arouse on one side or the other, fierce passions, and mutual recriminations and reproaches, which are any thing but agreeable, however naturally they may be looked for in the prosecution of enterprises of this nature: education meetings are necessarily in a degree exclusive in their character, and comparatively few minds are sufficiently enlightened to appreciate their great importance and utility; objects of undefined and general philanthropy would hardly keep any congregation awake, and interest only the few rare and disinterested minds, who are dreaming of the perfectibility of human nature; but a cattle show, where even the poorest man may present his cow in a competition for prizes, if she has any extraordinary merit; a show of household manufactures, where our wives and daughters may exhibit their dairy produce and their needle work, substantial evidences of their skill, industry and good housewifery; and ploughing matches, where the contests, however spirited, are as harmless as they are useful, and all these matters and occasions associated with marks of public distinction and honor, and premiums of substantial value, this is an occasion of wholesome excitement and universal interest. Here all the artificial distinctions of society which separate men and raise one man above another, are wholly removed from sight; men and women, the aged and the young, come together, to encourage the great art which lies at the foundation of human subsistence and comfort; and to exult in the goodness of that Divine Providence, which spreads its bountiful table for every thing that lives; which giveth us rain from heaven and fruitful seasons, filling our hearts with food and gladness.

The weather on Wednesday could not have been more favorable, although the rain of the two preceding days prevented, probably, the exhibition of some animals and articles of domestic manufacture, which would otherwise have been presented; but the show of animals was highly respectable. We were disappointed in obtaining the number of entries; but the pens of the society were nearly full. Of fat oxen, grass fed, there were several yokes of superior quality. A pair belonging to Mr Webster were very large, weighing over four thousand. We could not pronounce them handsome; they were of native stock, of large frames, and rather coarse, but they were heavy and in high condition.—There were several other yoke of smaller size but of excellent thrift. There were several valuable milch cows of capital appearance; but no particular account was

given of their product, either on the label on the pens or in the reports of the committees. This deficiency will be supplied hereafter. There were but two bulls exhibited and these were of inferior quality. Some of the young stock was excellent, especially a pair of twin heifers, owned by Mr Joseph Bryant, of Bridgewater. The stock, we believe, was almost exclusively native. Plymouth county is not well adapted to the raising of stock, and not much attention has been given to the subject. The show however did the Society much credit. Of pigs or sheep there was no exhibition, no premiums having been offered for this species of stock. Swine might be advantageously made a subject of premium. Pork is greatly in demand in this county, and manure equally. The soil of the county is in many parts highly favorable to the growing of Indian corn and the cultivation of carrots. Under these circumstances the raising and fattening of pork might be made a highly profitable business. If proper pains were taken there can be no doubt that to a certain extent, the sheep husbandry might be profitably pursued; but in the present condition of the fences throughout the county, it cannot be pursued except in peculiar situations, with safety to the flocks or the good will of the neighborhood.

The exhibition of domestic manufactures was highly creditable, and spoke well for the industry of the better half of the county. Some fine specimens were given of the squash family, who seem this year to have carried the day every where throughout the State; and have absolutely distanced the Rohan potatoes. Of these, however, one gentleman, Col. Washburn, of Bridgewater, reported an extraordinary yield, being 729 lb. from 3 lbs. of seed! and this was not all, as some hills were dug by mistake, and their product not taken into the account. The dairy produce was good; some of the butter of the first quality. Of the cheese we made no trial.

The state of the weather the day previous to the show prevented our seeing the ploughing match and drawing match, which occurred early in the day, before our arrival. We can only say that the ploughing was well done.

The dinner, good and substantial as it was, was considered merely as matter of refreshment, and no time was lost at the table; but immediately after it was despatched, the Society proceeded to the meeting house, which was crowded in every part, to listen to the addresses on the occasion, the reports of the several committees, and the awards of the premiums.

The address was delivered by the Rev. Mr Stone, of West Bridgewater, and was sensible, practical and useful, and full of pleasantry and good humor. The reports of the committees were given soon after, some of them drawn up with much ability; and we are promised the pleasure of laying them before our readers at a future time; and as we hope, the address likewise, of which a copy was requested for the press.

Plymouth county has contributed much to the advancement of an improved agriculture. An individual, well known to the agricultural community for his capital and judicious improvements, has rendered immense services by his unflinching zeal and his intelligent and persevering exertions. He has found other and efficient co-operators. There is no reason why agriculture should not be made a prominent interest in the county of Plymouth. The capacities of her soil are considerable. Her resources for manure are in many parts abundant; and markets are near at hand. Hitherto however, she has been much more of a buyer than a seller; an importer rather than a producer. It was remarked on the occasion that if the county were now completely enclosed by an impassable wall, her agriculture might support in comfort

and luxury a population five times as great as she now has. This we firmly believe; and on another occasion in a different form, we shall lay the grounds of this opinion before the public. Whether there is much hope of turning the attention of our community to agricultural labor and enterprise as we think it should be, we are almost afraid to say; but the explosion of many wild speculations, the failure of many money-making pursuits hitherto entered upon with an almost frantic ambition and avarice; and the uncertain state of the commercial business and currency of the country, may, and some alleviation of the distresses of the commercial community, we hope will induce many more than heretofore to seek for an honest support in agricultural labor; and to be satisfied with that moderate but at the same time sure and ample competency, with which the earth never fails to reward the labors of an intelligent, persevering, frugal and contented husbandry. II. C.

For the New England Farmer.

MR BRECK—It may not be altogether uninteresting to some portion of the readers of your paper, to peruse a brief account of any meeting of farmers from which resulted favorable impressions or improvement. The Commissioner for the Agricultural Survey of the Commonwealth on a recent visit at Pembroke, viewed a number of farms and collected many facts concerning prevailing practices and the measure of success that has attended cultivation. An inhabitant of the town, who thinks the success of agricultural pursuits at the foundation of all prosperity in a community, perceiving it impossible for the Commissioner to visit all the farmers, suggested the expediency of inviting them to meet him on an evening in the town house. This suggestion was approved, and on Monday evening, 21st inst., a respectable number of the farmers assembled. The meeting was opened by Mr Allen, who in a very brief manner disclosed the purposes of it, inviting attention to such remarks as the Commissioner might please to make, and requesting the farmers to make any inquiries prompted by their feelings or interests. The Commissioner then rose and addressed the meeting in an extemporaneous speech of 30 or 40 minutes. The unremitting attention given, proved that the audience were not insensible to a personal interest in the topics discussed. Some general remarks were made on the importance of an improved cultivation in every part of the Commonwealth. Mr Colman adverted to the character and capabilities of the soil in Pembroke and the kind of crops on which chief dependence should be placed, in a manner highly satisfactory to those who had given attention to the subjects. He gave much useful information relative to the cultivation and products in other sections of the State, and closed with some pertinent observations on the utility of commencing and temperately pursuing the culture of silk. One of the farmers then rose and spoke of the injurious influences of prejudice in the practice of husbandry, of bigoted attachments to accustomed implements or methods of culture, of the importance of regular reading and a frequent interchange of views among farmers.—Numerous inquiries and a free conversation engaged the attention of the assembly half an hour longer; the meeting was then dissolved, with an indication in every countenance that we had not assembled in vain.

The impressions produced in this meeting incline the writer to think that farmers in every town might derive important accessions to their knowledge and zeal in the practice of their art from frequent meetings, even if nothing beyond mutual inquiries and free conversation were attempted. But they might sometimes have prepared lectures, which would seem of easier and more profitable application than many of the lectures to which public attention is every week called.

M.
Pembroke, Oct. 25th, 1839.

For the New England Farmer.

MR BRECK - Dear Sir - I have noticed several inquiries in the N. E. Farmer for a mode of preventing cows from holding up their milk. When I was a boy I was told to milk either the two fore teats or two hind teats completely, before commencing the others. My impression is, that it was said that the hind teats should be milked first. I recollect trying the experiment a great many times with cows that hold up their milk after their calves were killed. I always succeeded easily in making them give it down; but I cannot affirm that they would not have given it down in those cases, if I had not adopted this expedient.

I recollect several instances in which others have tried this mode with success; and I have not known any instance in which it has failed.

But, for several years, I have given the duty of milking to my boys, and they say that I taught them that the two fore teats should be milked first. It is easy to try both ways, and to call that right which succeeds; perhaps both will succeed. I do not feel entire confidence that either of these modes will in all cases compel the cow to give down her milk; but the evidence is so strong that the experiment seems to be worth trying.

Very respectfully, S. W.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS, Saturday, Oct. 26, 1839.

Fine specimen of Lyson Apples, by F. Guild, Esq., from Mr Jacob Holyoke, of Marlboro.

Orange Quinces, weighing 18-1-2 and 20 oz. each, from Mr James Mory, Nantucket.

Surpass Virgoules Pears, from E. Emerton, Esq., Salem.

Fine specimens of the Dix Pears from the original tree, by Rev. Dr Harris, Boston.

Harrison's Fall Baking Pear of Cox, or Rushmore's Bon Chretien of Prince; a fine specimen of Capsheaf Pears and Freestone Peaches, from an imported tree - from E. M. Richards, Esq., Dedham.

Probably the finest specimen of the Duchess d'Angouleme Pears grown in New England, was exhibited this day by our President. It consisted of thirty large, fair, and beautifully yellowed Pears, grown on Dwarf Espalier, with fourteen others not exhibited. He also exhibited the Wilkinson in perfection.

For the Committee, B. V. FRENCH.

BRIGHTON MARKET.—MONDAY, Oct. 28, 1839.

Reported for the New England Farmer.

At Market 1475 Beef Cattle, 2100 Stores, 5200 Sheep, and 475 Swine. Several hundred Beef Cattle, two or three thousand Sheep, and some hundred Stores remain unsold.

Prices.—Beef Cattle.—Prices have declined and we reduce our quotations, viz: First quality, \$7 00 a \$7 25. Second quality, \$6 00 a \$6 50. Third quality, \$4 75 a \$5 50.

Stores.—Purchasers generally refused to pay former prices, consequently a less number were sold than was expected from the number at market. We noticed sales less than our quotations.

Cows and Calves.—Sales \$23, \$25, \$36, \$40, \$47 50, \$54, and \$65.

Sheep.—Dull. A large number unsold. We quote lots at \$1 50, \$1 71, \$1 83, \$2 12, \$2 37, \$2 50, \$2 85, and \$3 12.

Swine.—Nearly all at market were of the first quality, and in consequence of the short supply at market sales were made at an advance on former prices. One lot to peddle, ordinary and more than half sows, at 4 1-4. One lot 4 1-2 for sows and 5 1-2 for barrows, and several lots at 4 3-4 and 5 3-4. At retail 5 1-2 a 6 for sows, 6 1-2 a 7 for barrows.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending October 28.

SPLENDID BLOOM FLOWER ROOTS.

Just received by JOSEPH BRECK & CO. from Holland, a very large and well selected assortment of Dutch Bulbous Roots, among which are the following:—

HYACINTHUS—Double white, double white with red and purple eyes, double rosy, double red, dark blue, light blue and yellow, single white, white with red and purple eyes, rosy, pink, red, light and dark blue, yellow and variegated, comprising 150 varieties of choice named sorts.

TULIPS—Fine late named sorts, fine double do., mixed single, mixed double, single and double Van Throil for forcing, Parrots, &c. &c.

CROWN IMPERIALS—Double red and yellow, single red and yellow, striped leaves, &c.

POLYANTHUS NARCISSUS—White, yellow, white with yellow and citron cups, and citron with yellow cups.

NARCISSUS—Orange Phoenix, Sulphur Phoenix, Incomparable, Van Sion, and Tetras cutus, with double flowers; Trumpet major, Sulphur and Poetings, with single.

JONQUILLES—Double and single.

RANUNCULUS—Large double red and yellow Turkey, and other varieties.

ANEMONES—Many fine mixed and named varieties.

IRIS—English, Persian, Spanish and Sussiana.

CROCUS—White, blue, purple, yellow, cloth of gold, striped &c. in 25 sorts.

GLADIOLUS—Bizantium communis, with purple, red and white flowers; Carminas.

LILIES—Double and single white, striped leaved, and spotted; Calcedonia, Buliferum, Martagon, Kamtschatkana, Aurantica, &c.

PEONIES—Double white Chinese, double red do, double red and double white, double purple fringed, fennel-leaved, &c.

Also—Snow Drops, Anaryllis, Tuleroses, Ornithogalums of all sorts, Arum draucenulm, Geranium tuberosum, Allium flavum, Hyacinthus monstrosus, plamonsis, botroides and Belgicus of sorts; Fritularias, Cyclamens, &c.

The above choice collection of bulbs have been selected with much care, from one of the best houses in Holland, and are offered to purchasers with great confidence, believing they will give universal satisfaction to all who will give them a fair trial. Orders should be forwarded soon to the subscriber, No. 52 North Market Street, office of the New England Farmer. A liberal discount will be made to dealers. October 23. JOSEPH BRECK & CO.

PEAR, PLUM, GRAPE VINES, &C.

1000 Pear Trees of the most approved kinds; 1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;

500 Quince Trees; 3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hanburgh, Sweetwater, Pond's Seedling;

30,000 Giant Asparagus Roots; 5000 Wilmot's Early Rhubarb or Tie Plant, lately introduced;

Also—a good assortment of Gooseberries, Roses, &c. o different kinds;

All orders left at this office, or with the subscriber at Cambridge-port, or in Mr Lynch's haggaze wagon box, at Gould & Howe's, No. 8 Faneuil Hall, will meet with immediate attention. SAMUEL POND, Cambridge port, Mass.

Fruit and Ornamental Trees, Mulberries, &c.

Fruit Trees of all the different species;—The collections now offered, are of the most celebrated and surpassing kinds. The Pears are unusually fine—the Peaches and the Cherry Trees are also fine, and in very extraordinary numbers. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses, and Herbaceous Flowering Plants, for 1839, is ready and will be sent to all who apply. In that catalogue the very best kinds of fruits, so far as proved, are particularly designated by a.

100,000 MONS MELICANTUS Trees or any other reasonable quantity, or cuttings of the same, are now offered. The trees are genuine; all being raised by the subscriber, either at his Nursery here, or at his Southern Establishment a Portsmouth in Lower Virginia. Also the Elata, Cockspur and Buckhorn for Hedges, &c. Canton, Broussa, Moretior or Alpine, and some other Mulberries. All orders will be promptly attended to and trees when so ordered will be securely packed for safe transportation to distant places. WILLIAM KENRICK, Nonantum Hill, Newton, Mass. Oct. 26.

ROIAN POTATOES,

PEAR TREES.

For sale at the garden of the subscriber a large collection of Standard and Dwarf Pear Trees comprising most of the choice varieties of European and American origin. Orders by mail will be immediately answered. October 16. ROBERT MANNING.

MISCELLANEOUS.

BIRDS OF MASSACHUSETTS.

In pursuance of an order of the Legislature of this State, at its last session, a volume has been printed for the use of the members, containing scientific reports on the birds, fishes, and reptiles of Massachusetts, by the commissioners appointed by the executive of the State, for the purpose of making these reports. The following is an extract from the report of Mr Peabody on Birds. It presents considerations on a prevalent practice of our country population, which are well worthy of attention.

"Before proceeding to describe the numerous birds, which come next in the proposed order, it may not be amiss to make some remarks on the practice of destroying them, which prevails to a great extent in our State. Sometimes it is deliberately done, by those who wish to secure their orchards and gardens; and, in such cases, there is a right, no doubt, to prevent aggressions, if possible. But far more are killed every year by wanton boys, who without any reason but their own pleasure, are permitted to indulge in a cruel amusement, from which every man of sense and feeling should carefully withhold his children. Any one who can find sport in giving pain to animals, needs to be taught the first principles of humanity; and lightly as this matter is regarded, it is certain that this thoughtless indulgence always depraves the moral feeling more or less, and leads on to the formation of habits of idleness which are not easily broken in after years. In a busy country like ours, there are few, beyond the age of boyhood, who have time for play; a civilized man is supposed to find his enjoyments in his duties; and if he needs relaxation, he can find it without torturing animals, whose right to happiness is as good as his own.

It is, however, in the light of utility, that this subject can be most forcibly presented; and it will be seen that to exterminate birds which do a little harm occasionally, is to protect ourselves from a small evil at the expense of a greater: it is in fact securing the fruit by the sacrifice of the tree. There is no question that we are now suffering severely in consequence of this folly. No kind of cultivation is affected to any considerable extent by the ravages of birds, and if it should be, means may be devised to prevent them. Not so with the insects and their ravages; the fate of the locust, the apple, the pear, and many other trees, shows, that if insects fasten themselves upon one of them, we must give it up as lost, for all that we at present know. Surely, then, of two evils we should submit to the one which may possibly be prevented, rather than invite and encourage one over which we have no control.

A slight calculation will show what amount of service birds are able to render. Wilson makes the computation, that each red-winged blackbird devours on an average, fifty grubs a day; so that a single pair, in four months, will consume more than twelve thousand. Allowing that there are a million pairs of these birds in New England, which is but a moderate estimate, they would destroy twelve thousand millions. Let any one consider what an immense injury that number of insects would do, and this would be sufficiently striking to show how much we are indebted to the labors of these birds. But the computation may be greatly extended, for many insects have young by the hun-

dred; besides cutting off the existing destroyers, they are prevented from multiplying; and when we consider what myriads of birds are constantly and efficiently engaged in the service, it gives us an impression, beyond the power of calculation to reach, of the astonishing manner in which the increase of insects is kept down, simply by sparing the lives of their natural destroyers; and this it must be remembered, is the *only* means of preventing their increase and reducing their formidable numbers. No other remedy that man can apply, will reach the evil. This is the natural vocation of birds, and if, for the sake of removing a small evil, we will not permit them to live and labor in it, we must not complain when the natural consequences come.

This is not mere speculation; we have experience to teach us on this subject. Kalin records, that after some States had paid three pence a dozen for the destruction of blackbirds, the consequence was a total loss in the year 1749, of all the grass and grain, by means of insects which had flourished under the protection of that law. The example of our trees, just alluded to, is also a standing warning, for we see that new ones are adding to their numbers. The maple, perhaps the most valued of our ornamental trees, is now marked out for destruction, and in spite of all that we can do, will soon be entirely lost. There is nothing to prevent this process from going on; other trees will soon swell the list of victims, and when it is too late, we shall lament that we have extended the evil, by protecting our enemies and persecuting our friends. Every cultivator, for his own sake, as well as the public good, should endeavor to spread right views on this subject, and to show that the wanton extermination of birds is throwing difficulties in the way of horticulture and farming, which no industry, science or skill can overcome."

Morus Multicaulis, Esp. has been nominated for the Presidency by a western editor. The New Orleans Picayune says he will undoubtedly prove a popular candidate. John Smith, however, says he shall oppose him. John thinks him too aristocratic, and says that he belongs to the *silk* stocking gentry.

Orders have been given to prepare a sloop of war and a schooner, with all possible dispatch, for cruising on the coast of Africa, in execution of the laws of the United States against the disgraceful traffic in slaves, and for the protection of our lawful commerce in that quarter.

Beautiful Exclamation.—When the queen of France, consort of Louis Philippe, first heard of her late daughter Marie's death, she ejaculated—"My God! I have a daughter less, but thou hast an angel more!"

One of the most curious ceremonies, says a French paper, incidental to the accession of the young Sultan, is said by a Constantinople correspondent, to have been the solemn shaving of his chin for the last time. This once done, no razor is thenceforth allowed to touch his face, the beard being one of the attributes of supreme power, which must be suffered to grow without being touched by any kind of instrument.

The population of Cincinnati has increased forty per cent. since 1835: it now amounts to 40,000.

WINSHIP'S BRIGHTON NURSERIES,

AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed and forwarded to any part of this or other countries.

April 10.

Morus Multicaulis Trees from Seed.

The subscriber offers for sale 10,000 trees produced from seed of the genuine *Morus Multicaulis*. The seed was raised on his premises in 1835; the trees have been multiplied for the two last years by layers, their growth is more rapid than the ordinary tree, and appear to be sufficiently acclimated to endure the winter, some of them having been standing in the open field unprotected during the two last winters without any essential injury. The leaves are very large and of equal quality to any other kind for feeding silk worms. Those who are wishing to purchase a superior kind of Mulberry are requested to call and examine for the select: before the foliage is destroyed by frost.

CALVIN HASKELL

Hartford, September 11.

MULBERRY TREES.

The subscriber has on hand a quantity of Mulberry Trees of a kind which probably superior to any kind ever introduced into this country. They were imported, four years since, although they have sustained the rigorous cold of the last two winters entirely unprotected, yet it is believed a *Southern Western* climate would be more admirably adapted to the growth and propagation. Their foliage is most luxuriant and superior to any other variety. Seed produced by worms fed with the leaves, has been pronounced by judges to be the best ever manufactured by them, and is decidedly superior to the best Italian. A few thousand will for sale at immediate application is made to the subscriber where specimens may be seen.

Also—A few hundred *Morus Multicaulis* and Asiatic. JOHN N. BARBOUR, September 11. No. 30 Commercial Street, Boston

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay or Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels of straw in one minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made up together very strongly. It is therefore not so liable to the complicated machines in general use to get out of order.

MORUS MULTICAULIS.

6000 *Multicaulis* from 2 to 4 feet high, wood well ripened now standing in the field on the Jones Place in Angell Street half a mile from the Providence Market, for sale low (if taken in the field) by JOSEPH STEPHENSON on the premises or on application to STIMMONS & HODGES, Providence, October 23.

Fruit and Ornamental Trees, Flowering Shrubs, Plants, &c.

The present being the most favorable season for transplanting all kinds of trees and shrubs, we would remind those who are in want of Fruit or Ornamental Trees, Shrub Herbaceous Plants, &c. that we can furnish them at the lowest price at nursery prices, well packed for transportation to any part of the country. JOSEPH BRECK & CO. October 15.

AGRICULTURAL.

WORCESTER AGRICULTURAL SOCIETY.

Report of the Committee on Tools, Agricultural Implements, and Machinery.

John Davis, Worcester, Chairman; Silas Allen, Newbury; John C. Whitin, Northbridge; Moses Capton, Southbridge; Joel Nourse, Worcester. The committee on Tools, Agricultural Implements, and Machinery, beg leave to submit the following as their report.

The committee have examined the tools, implements and machinery, submitted to their inspection, with as much care as the time and circumstances would allow, and in some instances, witnessed satisfactory tests of their usefulness.

The exhibition was, in many respects, full and excellent; but in others less attention has been devoted to it by the makers of agricultural tools than desirable. The great object is to obtain tools that will perform the most and best work at the least expense of labor and power. It is, in truth, substituting mechanical skill for physical strength, and thus husbanding with good economy the resources of man and beast, and making them accomplish more and more by every useful improvement. This is often done by diminishing the size and weight of tools; often by modifying their form; and often by the union of both. The ordinary tools of the husbandman have, within the last twenty years, been so much improved by the skill of ingenious mechanics, that a farmer would almost excite the ridicule of his neighbors, who should attempt to retain those of the old model in his fields.

The attention of the committee was early attracted by a large exhibition of ploughs from the manufactory of Messrs. Ruggles, Nourse & Mason, of Worcester, who are well and favorably known to farmers in most parts of the United States. These gentlemen have, during the past year, improved their ploughs by adopting the leading characteristic of Jethro Wood's mould board, which gives a straight line from the share to the other end, and by lengthening the mould board and the land side. The advantages which result from these changes will be apparent, when the plough is viewed as a wedge which is first to separate, and then to turn over the soil. This it does by a combined operation, and it is obviously better that the friction of the furrow slice upon the mould board should be equal, than that it should be encountered at two points, as in the concave mould boards. The effect of lengthening the irons, the committee is persuaded, will be to keep the plough more steady in its work and lay over more smoothly the furrow slice.

These gentlemen exhibited nine sizes of this improved plough, ranging from a heavy strong plough, capable of the severest service, to a plough for the gardener. They also exhibited four sizes of the side-hill or swivel plough, which has passed through the same improvements, and is rapidly recommending itself to farmers for all kinds of work, as it leaves

no banks nor gutters. They also exhibited two sizes of the cultivator, in an improved form; one for the field and one for the garden. Their extensive sales of this implement, as well as of the ploughs, is the best test of their usefulness, and of the just estimation in which they are held by the public. They also exhibited a plough for paring low grounds, covered with moss, bog or other vegetable substances which it is desirable to destroy; and the committee are of opinion that it will be a valuable acquisition to the farmer. They also exhibited a drill barrow for sowing turnips and onions, which answers a useful purpose.

These, as well as all the tools made by these gentlemen which have fallen under the observation of the committee, are distinguished for neat and tasteful workmanship, as well as for strength and durability. They renounced all claim to any premium or gratuity from the society, being willing to enrich the exhibition, and trust to their own great merits as mechanics for that public patronage to which the committee think they have justly entitled themselves.

There were two exceedingly good straw cutters presented for exhibition, one by Mr Boynton, and the other by William Hovey, of Worcester. Mr Boynton's has, we understand, been in use for a considerable period of time, and does its work well and with great despatch, though they had no opportunity of seeing it operate. They saw Mr Hovey's perform, and were much pleased with the simplicity of the arrangement and the rapidity with which it cut hay, straw, corn stalks, &c., and were satisfied that it will prove a most useful machine to the farmer, being easily adjusted and kept in order, while a man can conveniently keep it in motion and feed it. The committee had no doubt that the food of a stock of cattle, such as is kept by most farmers, could be cut with very little additional loss of time beyond the usual labor of feeding without cutting, and recommend it to farmers as worthy of their notice.

A corn planter and seed sower was exhibited by George F. Lewis, of Boston, and the committee were pleased with the apparent perfection of the construction and its apparent capacity to answer the great purpose for which it is designed. It opens the furrow, drops the corn, and covers it, as the horse moves on, and all this is done with as much ease and despatch as you can furrow one way. It therefore strongly recommends itself on the score of economy, and the committee see no reason why, in mellow soils, it will not do all that is claimed for it, and prove a valuable labor-saving tool. It plants the corn in hills, at any distance from each other desired, and will sow the smaller seeds in the same way or in rows.

Messrs Ruggles, Nourse & Mason exhibited a vegetable cutter, which has been some time in use, and will cut about a bushel a minute.

Another was also exhibited as the invention of Mr E. G. Matthews, of Worcester, which is cheaper and cuts with greater despatch, while it does its work equally well. The committee saw neither of them work, but judging from the information be-

fore them, they came to the conclusion that both were valuable inventions; but the latter recommended itself most strongly to the farmer, as performing best and costing least.

Mr Walker, of Worcester, exhibited a corn sheller of ingenious construction; but the committee are not, from what they saw of it, prepared to recommend it as surpassing other inventions of the kind.

The committee next met in the room an ox yoke of Mr Dodge, of Sutton, whose good works in this way have long since made him known to the public. It is certainly a beautiful specimen of good workmanship and good proportions throughout, and is a new proof that Mr Dodge deserves to retain the favorable opinion of the public. The iron work appears to have been done by Mr Putnam, who has no occasion to shun a competition even with Mr Dodge.

Warren Hunt & Co. of Douglas, exhibited several kinds of axes, and as specimens of good workmanship they would do no discredit to any exhibition.

Col. Abbott, of Holden, exhibited several chisels, an axe, and some moulding irons of most excellent workmanship, suffering nothing by comparison with those of Messrs. Hunt & Co. which lay beside them.

Mr Francis Kinnicut and Messrs Newcomb & Bowen, hardware merchants of Worcester, exhibited chisels, bits, bit stocks, a spoke auger, and various other articles manufactured by American mechanics, which attracted much attention for the good workmanship displayed in them, and the committee were gratified to have the exhibition thus enriched from the stores of these gentlemen.

Messrs Green & White, of Grafton, exhibited a rich case of shoemakers' tools of their manufacture, containing a great variety, and reflecting great credit upon their skill and enterprise as mechanics. These tools were much admired, and we doubt not this public exhibition will bring the makers into extensive and favorable notice, which we believe they justly deserve.

Mr Goodwin, of Sterling, exhibited a boot crupper, which appeared to the committee to be a valuable invention, performing its work with great exactness, leaving the leather smooth and in good order to work, while it is believed there is little danger of tearing or otherwise injuring it.

Mr Jonathan Whipple, of Grafton, exhibited a machine for cutting out the sole leather of boots and shoes. There were no shoemakers upon the committee, but as far as they were able to judge, the machine performs its work with great despatch and economy, and for these qualities recommends itself to those who have occasion to use it.

Mr Samuel McClintock, of Vermont, exhibited a shingle machine, which the proprietor represented as valuable; but the committee did not see it under circumstances which would enable them to speak with confidence as to its usefulness. The timber is steamed before it is subjected to the knife.

Mr Albert Tolman, of Worcester, exhibited a light family carriage, as he styles it upon his card, weighing 503 lbs. The whole style and workman-

ship, inclusive of proportions and finish, are tasteful and do great credit to the skill of that gentleman. It attracted much attention and adds to his reputation.

Messrs Breeke, Poole & Brown, of Worcester, also exhibited two light buggies of very tasteful construction, and of exceedingly good workmanship. They also exhibited a carryall, commodious and throughout of good workmanship. These carriages are distinguished for their useful character and designed undoubtedly to supply the great daily demand which is felt for such accommodations. The committee think them excellent of the kind, and were rejoiced to meet them at the exhibition.

Mr William Leggett exhibited a light gig harness, which, in all its parts, was a specimen of good work and good stock, and every way creditable to that skilful mechanic.

An apple parer was also in the exhibition room, well made, and as the committee thought useful, though they could not learn who placed it there.

Messrs Newcomb & Bowen exhibited several stoves of improved workmanship, and well contrived to answer the purposes for which they are designed. The committee noticed among them Olmstead's with its radiator, and Wheeler's cooking stove, which, they believe, are in high repute.

Mr Henry Miller also exhibited several stoves of like character, with some improvements of his own, as the committee understood, which appeared to be very useful, and were favorably spoken of by those who had used the stoves.

It will be perceived that several of these articles did not fall within the scope of the duty assigned to the committee, but they examined and now report upon them, because they were so urged to do, as otherwise they might remain unnoticed.

The committee, in closing their labor, would observe, that if more time had been allowed them, they would have enlarged upon some of the more important matters under their consideration; but the brief space of a few hours to make the examination and report, forbids much deliberation.

Ten dollars, and no more, were placed at their disposal, it being all the society could spare to sharpen the tools of the farmer. This sum will have one advantage over a larger, as it will excite no unkind feelings, however it may be distributed. The committee have directed that it shall be awarded as follows:

To Wm. Hovey, for his straw cutter	\$2
To George F. Lewis, for his corn planter	2
To J. Whipple, for his leather cutter	1
To Mr Goodwin, for his boot crimp	1
To Green & White, for their case of tools	2
To Col. Abbott, for his tools	1
To E. G. Matthews, for his vegetable cutter	1
All which is respectfully submitted in behalf of the committee.	

JOHN DAVIS, Chairman.

Committee on Leather and Wool.

Lewis A. Maynard, Worcester, Chairman; Jacob W. Watson, Princeton; Nathaniel Lakin, Paxton; Alexander De Witt, Oxford; Jason Goulding, Phillipston; Amasa Wood, Milbury; Sullivan Thayer, Uxbridge; Jabez Low, Leominster.

The committee on Leather and Wool, and all Manufacturers of Leather and Wool, and divers other articles, beg leave to report.

Your committee regret to commence their report with regrets; but they really regret that the exhibi-

tion has been so sadly deficient in leather and articles of leather manufacture. The liberal premiums offered by the society for sole leather, cow hide boots, calf skin boots, calf skin shoes and brogans, have not been claimed.

Two lots of calf skins only were offered; one by Col. Jacob W. Watson, of Princeton, and one by Mr Matthew C. Carnell, of Leicester. The premium of seven dollars for the best manufactured calf skins, not less than twelve in number, is awarded to Jacob W. Watson, of Princeton. It is due to Col. Watson to say, that he withdrew from the committee while the calf skins were being passed upon. Your committee recommend a gratuity of four dollars to Mr Carnell for the lot presented by him.

Six sides of harness leather and one roll of upper leather, were offered by Mr Seth Blanchard, of Harvard. A gratuity of two dollars is recommended to Mr Blanchard for his harness leather.

Thick boots of very substantial material, were exhibited by Messrs Southgate & Wall, and Mr. J. E. Edwards, of Worcester. Twelve pairs of ladies' shoes, were presented by Mr Jason Collier, of Worcester, of elegant workmanship. Some thin boots were exhibited by Mr Samuel B. Scott, of Worcester, which, in the opinion of your committee, united much elegance with firmness and durability.

Ten pieces of broadcloth were entered for premium. Six by Samuel Slater & Sons, of Webster; three by Thomas Bottonly, of Leicester; and one by the Oxford Woolen Manufacturing Company, of Oxford; and so nicely were their merits balanced, that your committee were much embarrassed in coming to a conclusion. They finally awarded the first premium of twelve dollars to Samuel Slater & Sons, of Webster, for their piece of invisible green containing fifteen yards. They also awarded the second premium of eight dollars, to Samuel Slater & Sons, for their piece of fourteen yards, of like color, dyed in the wool. A piece, from the lot of Samuel Slater & Sons was selected, as meriting the first premium; but it was found, upon examination, not to contain the requisite number of yards. Your committee are of opinion, that all the broadcloths, for firmness of material and beauty of finish, might safely challenge comparison with any foreign fabrics of like character, whether imported or *smuggled* into the country.

Three pieces of satinnet were offered by Mr Rufus Robinson, of Oxford, and two by Mr John Metcalf, of Worcester. The lot by Mr Robinson was very finely finished. That of Mr Metcalf was of very firm texture and handsome finish. The first premium of ten dollars is awarded to Mr Metcalf, for his piece of blue satinnet, containing twentyseven yards. The second premium of six dollars is also given to Mr Metcalf for the other piece presented by him. No cassimeres were offered.

It is here proper to state, that the ownership of no article was known to any member of the committee previous to awarding the premiums, save to the chairman; and he, by the rules of the society, is not allowed to have any opinion, except in cases where there is an equal division, which fortunately did not occur.

Flannels were presented by Mrs Lucy Rich, of Charlton, Mrs Thirza L. Sibley, and Mrs Harriet P. Dana, of Oxford, and Mrs Thirza Nichols, of Charlton. The first premium of six dollars was awarded to Mrs Rich, and the second of five dollars to Mrs Nichols. One piece of white flannel, of

very good quality, was offered for exhibition by Mr Rufus Sanger, of Worcester.

Coverlets were presented by Mrs Clarissa Russell, of Oxford, Mrs Sarah Slade, of Paxton, Mr Lucy M. Hersey, and Mrs Nancy Hall, of Worcester, and Mrs Stillman Morse, of Hubbardston. The first premium of four dollars, for the best wool coverlet, was awarded to Mrs Hersey, and the second of three dollars, to Mrs Slade for her wool coverlet.

There were six pairs of stockings presented by Mrs John Clapp of Leicester, and five by Mrs Thirza L. Sibley, of Oxford. The first premium of three dollars, for the best woollen half stocking, was given to Mrs Sibley, and the second, of two dollars, to Mrs Clapp. Three pairs were presented by Mrs Southgate of Leicester, a lady of *four score and eight years*. These would have received a premium, had there been the requisite number. A gratuity of one dollar is recommended to Mrs Southgate. A gratuity of one dollar is also recommended to Mrs Chase of Sutton, a lady of *seventy five years*, for four pairs of cotton hose exhibited by her.

Two woollen carpets were presented by Mrs Elizabeth Wilcox, of N. Brookfield; one by Mrs Relief Felton, of Barre; one list carpet, by Rufus Robinson, of Oxford; another by Mrs Lucy M. Hersey, of Worcester; and two by Mrs Harriet Watson, of Leicester—one, a stair carpet. The first premium of twelve dollars, was awarded to Mr Robinson, and the second, of eight, to Mrs Felton, and the third, of five, to Mrs Hersey.

Two pieces of frocking were exhibited; one by Mrs P. Rich, of Charlton, one by Mrs Abigail Pratt, of Oxford, to each of whom your committee recommend a gratuity of one dollar. Two blankets, by Mrs Ruth B. Wheeler, of Lancaster, to whom a gratuity of one dollar is recommended; and two cradle rose blankets were offered for exhibition, by Mr Rufus Sanger, of Worcester; these were very soft and beautiful articles; and prove Mr Sanger to be quite judicious in the furniture of the cradle.

A quilt was exhibited by Miss Elvira Childs, of Barre, and one by Mrs Clarissa Russell, of Oxford. Also, two silk quilts by Miss Harriet P. Dana, of Oxford—very delicate articles. Ten bundles of yarn were exhibited by Mr D. S. Messenger, of Worcester, manufactured by J. Wheelock & Son of Uxbridge. This was considered to be of very superior quality, and a gratuity of two dollars is recommended to the manufacturers. A gratuity of two dollars is recommended to Mrs Thirza Nichols, of Charlton, for a very substantial woollen shawl. A center table cover of great beauty and elegance was exhibited by Miss Ophelia Phipps, of Framingham, to whom a gratuity would have been recommended, if that lady had been a resident of the county of Worcester.

There was a great display of hearth rugs, many of which were very tastefully and beautifully wrought. Your committee are precluded, by the great length of their report, from noticing many of them as their merits deserve. They would not fail, however, to notice one, by Miss Elizabeth Howland, of North Brookfield, a girl of thirteen years of age, upon which a deer, with a luxuriant growth of horns, was very accurately and beautifully wrought. A gratuity of one dollar and fifty cents is recommended to Miss Howland. A gratuity of two dollars is also recommended to Mrs Abigail C. Snow, of Fitchburg, for a rug presented by her, upon which is wrought a representation of

“Colossal Statue of Peter the Great, taken from the Penny Magazine.” Gratuities of one dollar each, are recommended to Mrs Phebe Weston, Westminster, Mrs Eliza Warren and Miss Sarah Parker, of Leicester, and Mrs Josiah Cutting, of Ampleton, for rugs severally presented by them. Gratuities of fifty cents each, are also recommended to Miss Eliza D. Bliss, of Warren, and Mrs Nancy B. Sawyer, of Lancaster. Two were also presented by Miss Sarah Perkins, of Worcester, to whom a gratuity of one dollar is recommended. A gratuity of two dollars is also recommended to C. Peabody, of Sutton, for one presented by him.

Your committee feel that many articles, which attributed much to the exhibition, have escaped their notice; but they believe all omissions will be generously pardoned, when it is considered how much they had to do, and how little time they had to do it in.

LEWIS A. MAYNARD, *Chairman.*

From the Farmer's Cabinet.

IALOGUE BETWEEN FATHER AND SON.

PART II.

Proposed conversation between a provident and improvident farmer, and their respective crops and stocks, &c.

Frank.—Well, father, you see the book is right: nothing is impossible.” When shall you be ready to give us the other side of that picture which you yesterday drew for farmer Grabb?

Father.—The twin brother of the above proverb “nothing like time present”—by means of both, may perform prodigies; so let us try at once. We will take our neighbor Sykes for the converse of the picture, and suppose him going into his fields “mediate at eventide.”

No. 1. *Wheat.*—Ah, Farmer, I am glad to see that ‘tis not often that you are absent for two evenings—I was afraid you were sick.

Sykes.—Why, you see I had promised my wife to attend to some little alterations about the house, and that has prevented me from seeing you as usual—we must take care of the women, you know, or they will not take care for us—but you look well.

Wheat.—Yes, thanks to your bounty. I am now riding on that magnificent coat of manure which I gave to the young clover last spring, and just the time too, when it is needed, for if you will amine the plants on your left, you will find that their ears are already formed in the blade, and that they are all *five chesters*, too.

Sykes.—That’s capital! Now that comes of being kind to the soil.

Wheat.—And now, will you cast your eye over the ridges, and say if you see any piece of wheat in the county so uniform and regular in its growth. The color of the plants on the sides of the ridge, is, in every thing, of a deeper green than are those on the top or crown of the ridge—a sure prognostic, this season of the year, of a heavy crop. The field just below is wheat, sown after a whole year’s plow, with dung; but there the order is reversed, and the plants which are near the furrows on the sides of the ridges, are weak and yellow. And they trace the rows of green spots, in straight lines right across the fields! They were occasioned by the heaps of dung, which remained unspread for weeks, until they were overgrown with weeds, upon which was termed a fallow! The weeds now are

sturdy witnesses that the cultivation and dung have done much more for them than for the wheat, and yet it is probable that Farmer Grabb expects to reap a profit from his crop!

Sykes.—I do not think that he will have either a reap or a profit. Your present appearance warrants an early harvest, by the blessing of a good season, and I am delighted with the prospect. Can I do any thing more for you?

Wheat.—No, but there is something that you must do for yourself—you must increase the size of your stack yard—I go for nothing less than forty bushels per acre.

2. *Corn.* *Sykes.*—Well, I am glad to see you looking so much better; your first appearance was very weak and sickly, and my neighbors wanted to persuade me it was because I sowed the seed with Buckminster’s drill, but I knew that could not be the cause, for I never saw any machine operate better; I only wish the handles were a little longer and lower.

Corn.—My sickly appearance was owing to your own good management.

Sykes.—Why, how could that be?

Corn.—You know that you are in the habit of ploughing a *telle* deeper every time, and thus a small portion of the sterile subsoil was brought to the surface, and in this the seeds were sown; and the roller of the drill passing over, (a capital invention) pressed them so closely into the clay, and rain falling immediately after, and following the track of the roller, the surface became so hard and dry, it was with difficulty that I could penetrate it, and for a few days I know I looked miserably; I however soon got to the manure below, which you had so bountifully supplied, and now I feel as though I could mount to the height of ten feet. If the season should be favorable, you may put me down for 120 bushels per acre. I am in no fear of the weeds which I see springing up around me—you’ll take care of them, I know.

No. 3. *Sugar Beets.* *Sykes.*—Ah! Mons. Sugar Beets, how do you do? How you like our country and climate? How you like the exchange?

Beets.—Ah! Mons. Farmer, I like your country! I like your fine, light and sunny days—they make *saccharine*; I like the exchange too, ‘tis all in favor of America. But what for you not make sugar? make plenty sugar—more than in France; great remuneration! sweet recompense—no trouble—all pleasure—all profit!

Sykes.—I am not prepared to make sugar this year—next year I will do it without any fear of the result. In the mean time, unlike most other speculations, the growth of the sugar beet is about the most profitable crop which a farmer can grow for winter food; horses, cattle, sheep, hogs and poultry, all are fond of it; and better than all, it contributes, in a surprising degree, to the farmer’s comfort during the dreary time of winter, as it enables him to meet his animals without reproach, and gives him the means of fattening his stock at a time that others are starving; and he can rear house lamb, which about Christmas, would bring a fine price in the market. In the introduction of this crop to notice, there has been no mistake, and in substituting it for a crop of barley, I have relieved the land of an exhausting crop, and adopted one that is ameliorating; requiring neither fallow or dung, when the land is in good heart—so farewell, Mons. S. Beet.

S. Beet.—Adieu, Mons. Farmer—“vive la republic America!”

4. *Potatoes.* *Sykes.*—Well, the progress which you have made in growth during the last two days surprises me! But never, for a moment, have I doubted the fulfilment of my most sanguine expectations respecting this, my favorite crop.

Potatoes.—But you have left us nothing to do but to grow: your labors began last autumn, when you ploughed the land deep, and laid it high and dry for the winter; and before others could get on their land in the spring, you had planted your crop. Then again, your judicious management in not moulding us up—we have only to go on to maturity, while the crops of those who keep moulding, never know where to be, or what to be at; for just as they have discovered the height at which to form the bulbs, comes the hoe, and buries them so deep as to ruin them: they are therefore compelled to begin to form their bulbs higher, to be within the influence of the sun, leaving their first formed bulbs to their fate; but, exhausted in a degree by the double exertion, they are weakened, so as not to be able to bring the higher crop, any more than the lower, to perfection, and so both are much reduced, both in quantity and quality, having many small and useless bulbs; happy, however, if they escape a third, or even a fourth moulding. Men are very silly to suppose that potatoes don’t know their own business best; their fear, that without moulding, they would form their crops on the surface, is very childish; why, *even they* themselves would not be guilty of any thing so thoughtless; their desire is, only to find the spot where they shall be within the reach of the sun’s rays, and men need not fear that they will get above it. All the crops that are not moulded up, are free from those half formed bulbs, or warty excrescences, which are so apt to deform those which have been nursed into the rickets; and there are very few small bulbs, for the root is not anxious to form more than it knows it can bring to perfection. By your excellent management, you will secure a harvest ten days earlier than your neighbors, a crop larger in quantity, and superior in quality, and which will command an extra price in the market—put us down for 750 bushels per acre.

5. *Clover.* *Sykes.*—Well, this is the finest crop of clover in the country, and will soon be fit for the sythe.

Clover.—And no thanks to me, for you made me what I am, by that magnificent covering of compost by which I was literally buried alive. If the season remains favorable, I can promise you two tons of hay per acre the first crop, one ton per acre the second, and a capital aftermath for your dairy, and if that won’t yield you a profit, why then quit, and go a fishing!

6. *Cows in Pasture.* *Sykes.*—Well, Fanny, Kitty and Judy, what have you done with Bill?

Cows.—Oh! he lies under yonder hedge, complaining *it is easier to lie down than to rise*, and thinks it hard to have to accompany us twice to the yard when we go to be milked—indeed he will soon be too fat to be healthy.

Sykes.—Well I think you all live in clover, and the return which you make of ten pounds of butter each per week, is a proof of your gratitude for good treatment.

Cows.—We are very happy, and the proverb says, “without comfort you can’t make butter.”—But our happiness is owing to your excellent care of us, especially in dividing our pasture into three compartments, and changing us often—if men were but sensible of the advantage this is to the dairy, their cows would not be compelled to lie in the

same pasture until the very atmosphere is contaminated with their filth; the milk would keep longer, and the butter would not be so soft in hot weather, to say nothing of the trifling circumstance of about two pounds of butter a week from each cow, in favor of your plan.

Sykes.—Well, I never heard cows talk so reasonably before! and I wish you would read Grabb a lecture upon Dairying; but unless he is the merest idiot alive, he must sometimes have heard and read, and felt the reproachful looks and low murmurings of his poor half starved animals in the garlicky meadow below; but he is sunk so low that it must be up-hill work for him, I know.

7. Sheep. *Sykes.*—It is remarkable, that just as I had determined to dispose of my Leicester, and purchase sheep of a smaller breed, more suitable for short pastures, that Farmer Grabb should decide upon parting with his Southdowns, on the principle, that "as a sheep is a sheep, you know, (glancing his eye at Frank,) a large one must be more valuable than a small one!"—*Frank.*—(That's a capital hit at me! I shall never forget the lesson which I have been taught)—so our exchange was no robbery.

Sheep.—To us it was "all tother way," as Farmer Ashfield says, but Grabb's sheep declare it was robbery, rank robbery; for they have been robbed of the means of existence.

Sykes.—To me it has been advantageous, and has proved the truth of the calculation on proportioning sheep stock to land—"The same land which carried indifferently, fortyfive long woolled sheep, maintained in good plight one hundred and fifty Rylands." I am therefore satisfied with the exchange.

8. But here come the Horses.—Well, my beauties! why, where are ye going in that frolicsome mood?

Horses.—Oh, we have eaten our supper, and are now going to rest in the upper pasture; we say to rest—Farmer Grabb's horses go to labor, for as they get no food in the stable after their day's work, they are compelled to gather their supper before they eat it, and hard work it is, with a bite so short; and after laboring at the plough all day, and all night at a short bite, 'tis no wonder that it costs him more in whips than in corn. We shall therefore be ready by break of day for whatever you will put us to, for "with horses who are kept above their work, their labor is play."

Sykes.—Well, but take care now, and if you meet Grabb's horses down the road, don't go to play with them, for they have something more serious to think of. Halloa! where did that groan come from? "And yet another and another," as the man says in the play. Oh! 'tis only the hogs, who have overaten themselves again; this is butter-making day, and they are always a little uneasy after that.

Hogs.—And so would you be, if you had swilled as much as we have; but you men have no feeling for poor dumb brutes!

By this time Sykes had reached his house, and entered, singing the last verse of that fine old song, "No glory I covet;" it runs thus—

"How vainly through infinite struggle and strife,
The many their labors employ!
Since all that is truly delightful in life,
Is what all, if they will, may enjoy."

Sykes.—Well, wife, your elegant supper table looks very inviting!

Wife.—Frank, get your father's slippers.

Sykes.—And my bettormost "Blouse," I mean now to "rest and be thankful." And Frank, after supper, and while your mother and sister are "plying their needles," you shall read to us "The Yellow Shoestrings," which I read when I was a boy; and to the golden rule contained in that little book, "Nothing is impossible to a willing mind." I owe the chief blessing of my life, don't I, wife?

Wife.—Well, I confess that if it had not been for your perseverance, the difficulties which opposed our union would never have been surmounted, and that, I guess, would have been unfortunate for both of us.

Sykes.—Well, after that, I think we may go to supper!

Frank.—Thank you, father,—these stories will make a beautiful pair of portraits, and shall be preserved by me with gratitude; together with those beautiful lines which you gave me yesterday, and which have since been continually in my thoughts:

For every evil under the sun,
There is a remedy, or there is none;
If there be one, try to find it,
If there be none—never mind it.

*The French frock, a most convenient and suitable dress for farmers.

R. ISLAND SOCIETY FOR THE ENCOURAGEMENT OF DOMESTIC INDUSTRY.

Since publishing the account of the Cattle Show and Fair of this Society, from the Providence Journal, two weeks since, we have received the official account. We should have preferred to have published it direct from the Society, as the account is more full. We will, however, add the Report of the Committee on Butter, also the Report of the Committee on Agricultural Experiments, Vegetable Crops, Grain, &c., excluding the premiums awarded, already published.

J. B.

The Committee on Agricultural Experiments, Vegetable Crops, Grain, &c., beg leave respectfully to report—

That they have examined with a tention the various samples of produce exhibited, of which may be particularly noticed, the Rohan potato, mangle wortzel and common red Beet, Ruta Baga, Peppers, Squashes and Pumpkins, both of foreign and domestic origin,—that all submitted were of an uncommon size, perfection and beauty, thereby presenting substantial evidence of a present highly improved, and through their apparent productiveness, they trust, an earnest of future successful culture. But, however worthy the various specimens of their admiration and praise, they exceedingly regret, that for want of conformity by the exhibitors to the requisitions of the show bill, by communicating either verbally or by written statements, the mode and cost of culture; taking into the estimate the quality and quantity of manure used, its manner of application, labor, &c., your committee find themselves incapable of proposing at the present time, any premiums whatever for adoption;—they however recommend the following gratuities. [See account published.]

NOTICE.—For the special information of the Farmer and Horticulturist throughout the State, they would add, that an adjourned meeting of their board will be holden at Dr Mauran's office in Providence, on the first Wednesday in December next, (due notice of which will be given through the papers,) at which time they earnestly solicit, and hope

to receive from all engaged in agricultural pursuit, however limited their field of action, a full and accurate statement of their respective crops, modes culture, and particularly an explicit account of the expenses therewith connected; when adjudged premiums will be awarded to the successful competitor.

Respectfully submitted by
JOSEPH MAURAN, for the Committee.

The Committee on Butter and Cheese respectfully report—

That there were only fifteen packages of butter and two lots of cheese presented.

The butter was of various grades of excellence. None of it was considered of the very highest order; though much of it attracted a favorable notice.

It was difficult to decide upon the comparisons of merits of some of the best lots, they were so near equal in quality.

From the liberal premiums offered for the best cheese, it was reasonable to expect much greater competition.

The committee beg leave to remark that in the manufacture of butter, the most prominent fault are, oversalting, a want of uniformity in the same package in point of flavor, color, &c. The cream is often kept too long, and kept in an impure air, while rising it will absorb all kinds of impurities that may exist in the surrounding atmosphere, hence the nicest and best is the result of good management. The Liverpool bag or blown salt is seldom fit for the purposes of the dairy;—it is impure and often of very bad flavor; it is deficient in point, that of preserving animal substance from putrescence. Butter and cheese should be salted with the coarsest kind of Rock salt, washed perfectly clean, dried in the oven, and then reduced to an impalpable powder. When the buttermilk has been thoroughly worked out, a small quantity salt will preserve it; the less the better, provided it will keep. No butter can be kept good for a length of time in lumps, or in shallow open boxes. In all cases it is best to put it into kegs made any kind of sweet wood, with air tight covers. In the manufacture of cheese, we have time only to remark that the greatest error, next to robbing it cream, is to use rancid rennet.

In every instance the applicants for premium have failed to comply with the requisitions of the standing committee, by not giving a minute written description of the precise mode of making the butter and cheese presented. In consequence of this very important omission, we have awarded no premium to any one, but recommend the following gratuities to the most deserving. [See account published.]

STEPHEN H. SMITH.

From the New York Journal of Commerce.

MILK.

[From a correspondent in Europe.]

It is gratifying to see, from the columns of your paper, that deep interest has been awakened regarding to the quality of milk used in the city. It would seem as if no parent who reflects that his bones and muscles and constitutions of his children are composed from this very milk, could hesitate to incur any expense, to make any efforts which his circumstances permit, to ensure a supply of the very best material for this purpose. Even the most

igid economy requires it, whether we think of the expense of a feeble family, or of the continued demands which they often make upon parents, even for they are sent forth into the world. I cannot but hope that this feeling will even aid in the promotion of the northern rail roads, from which it is most truly observed the most effectual relief can be afforded. It may be said, indeed, that pure milk can be procured from the farms which abound in every direction from New York. But let it be remembered it must be transported for several hours a conveyances which would serve admirably for *ocomotive churns*—which cannot fail to prepare the milk to become speedily sour, whatever may be its original quality, unless indeed it may have been previously diluted and whitened with lime water.—On a rail road, it may be brought six times the distance in the same period, and almost without perceptible motion; to say nothing of the greater security of good food in places where grass is cheaper than slops, or even the mixture of decayed vegetables and parings and remnants of salad, &c., which form the refuse of the kitchen, and which are so often procured as a dainty morsel for the cow, to be returned afterwards in the form of pure milk!

I have recently met with a report addressed to the Medical Society of Paris, on the subject of milk, which shows the importance of procuring this food for the children from the purest source, in a new light; and proves that "distillery slops" are not only thing injurious to its quality. Messrs Pet and D'Arceet, distinguished chemists in Paris, were led to examine minutely the quality of different specimens of milk, from observing their very different effects upon children. Some which they examined, and which they found to be speedily brown up by the children in coagulated masses, was proved by chemical tests to have a predominance of acidity, though it was not perceptible to the taste. Other portions which were well digested, were proved to have a predominance of alkali, which is considered the natural condition of milk. On inquiry, it was found that the cows from which the first milk was obtained, were *fed in the stable*, with remnants of vegetables as well as hay, and almost without movement—that the alkaline and healthy milk was from cows allowed to *range and feed in the meadows*.

These observations led them to examine the varying qualities of milk on a more extensive scale, as to the simple fact of the predominance of acid or alkali, and for this purpose they availed themselves of a test which may be procured without difficulty from a chemist. It is paper dipped in a solution of *Litmus*. If it be of good quality, the blue color will be changed to red by a fluid which is acid. A tincture of the blue cabbage will detect acidity also, if it is sufficiently fresh, in the same way.

During a voyage through Flanders, M. D'Arceet, in company with the celebrated chemist Gay Lussac, visited some of the best dairies, in which the cows are fed upon the meadows, and found the milk *without exception*, to contain a predominance of alkali. They examined the milk of cows fed in the stall on turnips, the leaves of vegetables, &c., which were only allowed to pass two hours a day in the meadows, and found it as uniformly acid.

The same experiment was repeated in the grazing regions in the north of France, and uniformly with the same results.

It would seem then to be fully ascertained that pure and perfect milk can only be given by cows

that pass the greater part of the day in the meadows during the mild season, and that it cannot be furnished by cows which are fed upon the parings and tops of vegetables of other food than the grasses, and are deprived of exercise—to say nothing of the pernicious effects of the distillery slops or the sour and putrid remnants of the kitchen. And yet this milk must be the staff of life of childhood—the staff of which its bones and sinews are formed; and its quality will do much in determining the feebleness or vigor of the next generation in your city. It is too true that the impure and often infected air, and the limited exercise of children in a city—added to the incessant and intense excitement of its movement and bustle—while they often render childhood precocious, and youth premature, lead to decay equally premature in a generation taken together. But surely this is an additional reason for seeking the purest and best possible nourishment in order to counteract these inevitable causes of decline.

I am sure that many a mother will thank me for adding that these chemists, on observing variations equally great in the digestion of children fed by different nurses, found the same difference in the quality of their milk—and that which was thrown up frequently coagulated, was uniformly sour when it was received—not to the taste always—but as tested by litmus paper. They observe that the child is not only deprived in this manner of suitable food, but he is obliged to call for it 40 or 50 times a day, in place of 4 or 5 times, and thus fatigues and injures her own stomach, without being nourished, and wears and exhausts his nurse so as to render the quality of the milk still worse.—Such a state of things, they say, ought immediately to be remedied, and that it can often be done by giving the mother or nurse a more simple diet, or by means of medicine, which a judicious physician can prescribe, among which they consider minute doses of super-carbonate of soda the best.

But can nothing be done to palliate the evil until we can procure pure milk? M. D'Arceet made the experiment in his own family of adding one half a grain of super-carbonate of soda to a pint of milk from a city fed cow, and succeeded in rendering it harmless at least, and far more nutritious.—One of his children, so feeble that he despaired of being able to save him, was thus suitably nourished, and grew up to vigorous health, by observing daily the quality of the mother's and finally of the cow's milk, and taking the proper measures to correct its defects. Now it will be incomparably better to procure the pure milk of the grass fed cows on the banks of the Hudson and on the hills of Connecticut, than thus to feed the poor children with a drugged mixture; but it will be at least a temporary palliative until the northern rail road can be completed, and pure milk can be obtained as easily as the pure water of the Croton river.

Housekeepers will be glad to know that by adding the same proportion (one half a grain only to a pint of milk) good milk may be kept 24 or 36 hours, without danger of souring, even in warm weather. But let them beware of converting food into medicine by increasing the quantity, for I have known this "simple, harmless thing," as it is called, even in the shape of excessive drafts of soda water, produce sores in the mouth and lips, which indicates corresponding sores in the stomach, and this was followed by the miseries of dyspepsia and decline. An able physician assures me that he could ascribe the death of a patient, from a similar

state of mouth and stomach, to nothing but the famed morning cordial of Connecticut lay physicians, "*pearlash and cider*." It is time the world had learned that medicine cannot safely be used as daily food or drink, without leading to disease.

Yours, &c.

S.

THE CULTURE OF FLAX.

Travelling through our hill towns we are pleased to observe that many farmers have turned their attention to the raising of flax. This will be more beneficial to them than the raising of multicaulis or even the white mulberry. We should joy to witness a return of the times when nearly every family had one or more spinning wheels for wool and likewise the hand wheel for the drawing out threads of fine linen: the sound of this instrument, disagreeable though it may be to some, would restore many of the pleasant recollections of childhood.—What daughter of New England that would not be proud to present as a portion of her marriage dowry, counterpane and sheets and pillows of fine linen spun and wove by her own hand? "She layeth her hands to the spindle, and her hands hold the distaff. She seeketh wool and flax and worketh willingly with her hands. She maketh herself coverings of tapestry; she maketh fine linen. Many daughters have done virtuously; but thou excellest them all."

Every farmer who has suitable ground may find it his gain to have a plot of ground for flax. It is easily produced on the same ground that will raise a good crop of corn or oats. It should be prepared so as to be free of the seeds of weeds and wild grasses—before the seed is sown the ground should be stirred and pulverized. The time of sowing is the same as that of the earlier small grains. It used to be the fashion for ladies to spend their half a day or day in pulling flax, because they do their work in a better manner than the other sex often do; it should be so pulled as to preserve evenness at the bottom or roots composing each bundle. It is made to stand in the field in stocks until the head containing the seed becomes sufficiently dry for thrashing, when it is taken to the barn floor and thrashed with the flail after the usual manner of thrashing rye or wheat. The best method of rotting is believed to be the spreading of the flax in thin layers at a distance so as not to interfere with each other, on a common mown field in the month of September: the flax before the cold season arrives will, by the aid of alternate rains and dews and sunshine, become so rotted as to be broken out with ease. The breaking, which separates the shive from the beautiful stran, used to be done with the brake, a heavy instrument, which rises and falls upon the stalk; it may be done either by hand or by water or other moving power. Then follows the swingle knife upon an upright smooth board, which takes away what the brake has left. After this the hatchel, in the hands of the lady spinner, who prepares the article for her wheel, completes the process, giving the hackle the softness of silk, and leaving it ready for spinning.

Many millions of dollars might be saved to the country from the domestic culture of silk; and so might a few millions be saved by the cultivation of flax. The linseed often pays the farmer for his labor. But the substitution of elegant domestic linens for the foreign trash that is now used as linens would be such a benefit to the country as does not occur every year.—*Farmer's Monthly Visitor*.

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, NOVEMBER 6, 1839.

TO THE FARMERS.

The Commissioner of Agricultural Survey respectfully requests of the farmers of Massachusetts, and others, who may have it in their power, to communicate to him the results of any trials or experiments which they have made in the application of manures—particularly in the application of lime, gypsum, marl, bone manure, ashes, barilla, fish, sea-wreck, oils of any kind, salt, salt petre, urate, poudrette, peat, muscle bed, marsh mud, compost of any description, or any animal manures.

Information is desired particularly in regard to the points undenamed:

The kind of manure;

The condition of the manure: if lime, for example, whether powdered limestone or calcined; whether hot or effete. If animal manure, whether green or decomposed; single or mixed, &c. &c.

The quantity applied; the time and mode of application; the soil to which applied; the crop and the results; and particularly any results of a comparison between soils thus, and similar soils, otherwise treated.

The expenses attending any such manures and their application, are likewise matters of great importance; and in this case, labor may be estimated at one dollar for a man per day including board; and the same for a yoke of cattle or pair of horses.

The Commissioner particularly urges this subject upon the attention of the farmers, and earnestly solicits their aid. The matter is of universal and public importance; but he will consider any information given, a personal kindness, which he will do his best to reciprocate.

As the Legislature have made it his special duty to report early on the subject of the culture of wheat, he requests from those who have attempted the cultivation within the two years past or previously, whether successfully or not, any information they will be pleased to give him on this subject. The points of particular importance in this case are: the kind of seed; the preparation of the seed; the nature and condition of the soil; the previous crop on the ground, and the treatment of that crop; the manures applied, how, in what quantity, and when; the result; if any disease or blight or rust occurred, any circumstances connected with its occurrence, which may throw light upon its cause or prevention; if any insect, of what nature, and any remedy or protection against the evil, if such remedy has been ascertained.

Another point of great importance is the subject of insects or worms infesting or destroying corn or potatoes. The ravages of the cut worm among the corn this year, have been very extensive; and a remedy against them, if any could be found, would prove an immense boon to the country.

On these subjects the Commissioner requests the farmers to communicate with him as early as convenient; by the first or middle of December ensuing, if practicable. He hopes no one will hesitate, through any distrust of his inability to write in such a manner as he himself might wish. Practical men, who have clear ideas of the things they wish to communicate, though their spelling or grammar may not always be correct, find no difficulty in expressing themselves naturally and intelligibly, which is all that is in this case desired. The subscriber pledges himself to give neither name nor place to the public, in respect to any communication made to him, unless permission is granted to use them; and in respect to any communication which it might be

useful to publish, as far as depends upon him, he will do what he can to put it into a condition to meet the public eye.

Communications may be addressed to him at the office of the Secretary of State, Boston, by *private conveyance* where practicable, or by mail, if otherwise.

He would be glad to hear on any of these subjects from his friends in any of the New England States or in New York.

HENRY COLMAN,

Commissioner of Agricultural Survey of Massachusetts.

Printers favorable to the cause of agricultural improvement, in city and country, are respectfully requested to give the above an insertion in their papers, *pro bono publico*.

October 30th, 1839.

REVIEW OF THE SEASON.

The agricultural year is now drawing to a close. A severe frost occurred on the 20th ult. and vegetation is brought to a stand. The leaves have in a great measure fallen, though some still cling to the trees, like men, after the powers of action and enjoyment are gone, still holding on to life. The Indian corn harvest is generally concluded; and the house and cellars most soon be barricaded against the entrance of those relentless enemies, if so they may be called, cold and frost.

The review of the season, so far as the labors of the husbandman are concerned, present a most emphatical call for grateful acknowledgment. The earth has brought forth abundantly. Almost all vegetable products have been in perfection; and there are ample supplies for man and beast. It is both presumption and folly to suppose that every thing, or indeed that any thing in nature should be measured by our wishes or our notions of utility or expediency; but it would be difficult to point out a season, when a more liberal compensation has been made to agricultural industry and skill.

Early vegetables of every description came forward seasonably and in abundance. The small fruits yielded profusely. Grass has been every where much more than a middling crop; and after the first part of the summer, no season was ever more favorable to the securing of it. Rye and oats through the State, as far as we have heard, have given a great yield. Wheat in our part of the country, has in general produced an inferior crop; but in the western States it was never more abundant. It is said that wheat on the Wabash sells freely at thirtyseven and a half cents per bushel; and that it can easily be brought round to New York in sacks holding two bushels, by the way of New Orleans, and delivered free of all charges, at eightyfive cents per bushel. We have been told, perhaps however it may be only a traveller's story, and the due abatement is to be made from it, that one farmer in Michigan has this season, on thirteen hundred acres, raised thirtynine thousand bushels of wheat. Be this as it may, western New York is full of wheat. Dairy produce, too, through the country is abundant. Indian corn has come in well, and so perfectly has it ripened every where, that many farmers are in the situation of one who said he did not know what he should do for pig corn to feed his swine. The crops of onions, in some of our towns a large product, have, it is believed, fallen short of a usual supply. Sugar beets, ruta baga and carrots, were perhaps never better. More young stock has been raised in Massachusetts the current year, than is remembered to have been raised in any previous year. We might go on, but we stop here.

With all this abundance, in the midst of these unmeasured bounties of Divine Providence, perhaps there was never more or louder complaints of hard times and

hard pressures; and the commercial world seems to be threatened with a general crash. There is no mystery in all these matters; and we mean at some future time, to discuss at large the causes of these embarrassments and sufferings. It may not be very palatable to our pride to hear of them, but it may prove medicinal to our morals. Presently we shall learn that neither individuals nor communities, through either avarice or folly, can violate the great laws of nature or providence with impunity. If men will not labor they cannot be allowed to eat; and if they will not be satisfied with the gradual and moderate, yet ample gains of honest industry and just frugality, but will plunge headlong into every species of speculation and gambling, then, according to the proverbs of the wise, he that maketh haste to be rich shall seldom be innocent; and the folly of fools shall destroy them. All that seems to be lamentable in the case is, that the guilty drag the innocent into the same vortex of ruin. This arises from our social constitution; and is not without its benevolent designs and beneficent uses. Whatever the honest and industrious, however, may be doomed to suffer on account of other men's follies and crimes, there is one good, the greatest of all earthly goods, of which a just providence will never suffer them to be deprived—that is a clear conscience—the Romans called it, "the mind conscious of right." This is a treasure which the wealth of the world cannot purchase, and for the loss of which the wealth of the world would be a poor equivalent. H. C.

For the New England Farmer.

MR BRECK—I thank you for publishing Mr Bement's letter in your Farmer of the 23d ult. The imposition that are continually palmed off on the credulous in regard to the Berkshire pigs, will soon bring them in bad repute. The cross is now to be found in most an drove or sty, and if tolerable promising, then they are the "simon pures." Now, sir, I have examined many fine piggeries this fall, but cannot say from my observation, that any improvement has been effected as yet in a cross. Therefore, I would recommend to those who have the pure full bred Berkshire, to keep them so there will be crosses enough without the assistance of the honest breeder.

Yours, with respect,

Massachusetts Horticultural Society.

EXHIBITION OF FLOWERS.

Saturday, Oct. 26, 1839.

There was a good display of Dahlias on the 5th, 12th and 19th inst. On the latter day, Josiah Stickney, Esq. of Boston, exhibited upwards of two hundred specimens some of them of great beauty. On the night of the 5th and 6th inst. the Dahlia plants were destroyed by frost on all the low grounds in the vicinity of Boston, and in Boston on the night of the 21st inst. At Nahant, the Dahlia is still in all its glory, and our rooms were that day made gay by many fine specimens of the Dahlia and other flowers, from the garden of F. Tudor, Esq., Mr Hubbard and Dr Robbins. Among the flowers presented was a Lilac, "fresh and fair as lovely spring."

For the Committee,

S. WALKER, Chairman.

Multicaulis at a discount.—Of the eighty thousand trees advertised to be sold recently at Burlington, New Jersey, about ten thousand only were sold, at 7 1/2 ct for small trees, and 11 1/2 cts. for four or five feet trees the sale of the remainder being stopped.—Traveller.

BRIGHTON MARKET.—MONDAY, Oct. 28, 1839.

Reported for the New England Farmer.

At Market 1420 Beef Cattle, 1250 Stores, 4500 Sheep & 670 Swine. Several hundred Beef Cattle, and more than two thousand Sheep unsold.

Prices.—Beef Cattle.—We again reduce our quotations to conform to sales. First quality, \$6 75 a \$7 00. Second quality, \$5 57 a \$6 25. Third quality, \$4 50 a 25.

Barrelling Cattle.—All the Barrellers were at market but we have no knowledge of a single Ox being purchased for barrelling; and we are authorized to state that in consequence of the state of the market abroad and money affairs, the Barrellers refuse to pay a farthing more than \$5 00 for Mess Cattle, and other Nos. in proportion, nor will they contract now to pay any more for cattle to be delivered two or three weeks hence.

Stores.—Sales dull and prices heretofore obtained not obtained. We quote Yearlings \$10 a \$13. Two Year Old \$15 a \$26.

Cows and Calves.—Unusually dull. We noticed only to sales \$27, \$45.

Sheep.—Prices have further declined. We quote lots 50, \$1 62, \$1 81. \$1 92, \$2 25, \$2 50.

Swine.—Lots to peddle were taken at 4 1-4 a 4 1-2 sows and 5 1-4 a 5 1-2 for barrows. At retail 5 1-2 for sows, 6 1-2 a 7 for barrows.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded shelterly exposure, week ending November 3.

FRUIT AND ORNAMENTAL TREES, & C.

An extensive assortment of the finest varieties of Fruit trees, and a great variety of Ornamental Trees of large size, fine collection of Herbaceous Plants, Roses, Honey-suckles, Peonies &c. 20,000 genuine Morus Multicaulis, &c. of large size, the growth of Virginia. Also—1000 shels of Rohan Potatoes. Orders addressed to the subscriber will receive prompt attention. Newton, Nov. 1, 1839. JOHN A. KENRICK.

A RARE CHANCE.

For sale. A partner wishing to withdraw from an old established Agricultural Implement and seed Warehouse, leaving a good run of country custom, would be willing to dispose of his interest on liberal terms, as he is about engaging in other pursuits. To a person wishing to engage in respectable and profitable business, having some ready capital, it is an opportunity rarely to be met with. A liberal bid will be given on most of the purchase money if properly secured. Any communications addressed to "Lafayette," New York city, will be returned strictly confidential.

GREENHOUSE GLASS,

All sizes and qualities, for sale by LORING & KUPPER, No. 210 Merchants' Row. 21

DOMESTICATED WILD GESE.

A few pair for sale. Enquire at this office. November 6. 21

SPLENDID BULBOS' FLOWER ROOTS.

Just received by JOSEPH BRECK & CO. from Holland, a very large and well selected assortment of Dutch Bulbos' Roots, among which are the following:—

HYACINTHS—Double white, double white with red and purple eyes, double rosy, double red, dark blue, light blue and yellow, single white, white with red and purple eyes, rosy, pink, red, light and dark blue, yellow and variegated, comprising 150 varieties of choice named sorts.

TULIPS—Fine late named sorts, fine double do., mixed single, mixed double, single and double Van Thull for forcing, Parrots, &c. &c.

CROWN IMPERIALS—Double red and yellow, single red and yellow, striped leaves, &c.

POLYANTHUS NARCISSUS—White, yellow, white with yellow and citron cups, and citron with yellow cups.

NARCISSUS—Orange Phoenix, Sulphur Phoenix, Incomparable, Van Sion, and Tratus canticus, with double flowers; Trumpet major, Sulphur and Poeticus, with single.

JONQUILLES—Double and single.

RANUNCULUS—Large double red and yellow Turkey, and other varieties.

ANEMONES—Many fine mixed and named varieties.

IRIS—English, Persian, Spanish and Sussiana.

CROCUS—White, blue, purple, yellow, cloth of gold, striped, &c. in 25 SORTS.

GLADIOLUS—Bizantium communis, with purple, red and white flowers; Cardinalis.

LILIES—Double and single white, striped leaved, and spotted; Calceidonia, Bulferom, Martigon, Kampschatkian, Aurantica, &c.

PAEONIES—Fonble white Chinese, double red do., double red and double white, double purple fringed, fennel-leaved, &c.

Also—Snow Drops, Anaryllis, Tuberoses, Onithuliums of all sorts, Arum dracunculis, Geranium tuberosum, Allium flavum, Hyacinthus nonstrumosus, plamosus, botridios and Belgicus of sorts; Fritillarias, Cyclamen, &c.

The above choice collection of bulbs have been selected with much care, from one of the best houses in Holland, and are offered to purchasers with great confidence, believing they will give universal satisfaction to all who will give them a fair trial. Orders should be forwarded soon to the subscriber, No. 22 North Market Street, office of the New England Farmer. A liberal discount will be made to dealers. October 23. JOSEPH BRECK & CO.

PEAR, PLUM, GRAPE VINES, & C.

1000 Pear Trees of the most approved kinds;

1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;

500 Quince Trees;

3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburgh, Sweetwater, Pond's Seedling;

30,000 Giant Asparagus Roots;

5000 Wihnot's Early Rbularb or Pie Plant, lately introduced;

Also—a good assortment of Gonselcherries, Roses, &c. of different kinds;

All orders left at this office, or with the subscriber at Cambridge-port, or in Mr Lynch's baggage wagon box, at Gould & Howe's, No. 8 Faneuil Hill, will meet with immediate attention. SAMUEL POND, Cambridge port, Mass.

Fruit and Ornamental Trees, Mulberries, & C.

Fruit Trees of all the different species—The collections now offered, are of the most celebrated and surpassing kinds. The Pears are unusually fine—the Peach and the Cherry Trees are also fine, and in very extraordinary numbers. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses, and Herbaceous Flowering Plants, for 1839, is ready and will be sent to all who apply. In that catalogue we give the best kinds of fruits, so far as proved, are particularly designated by other.

100,000 MORUS MULTICAULIS Trees or any other reasonable quantity, or cuttings of the same, are now offered. The trees are genuine; all being raised by the subscriber, either at his Nursery here, or at his Southern Establishment a Portsmouth in Lower Virginia. Also the Elata, Cockspur and Buckhorn for Hedges, &c. & Cauton, Broussa, Moret-ti or Alpine, and some other Mulberries. All orders will be promptly attended to, and trees when so ordered will be securely packed for safe transportation to distant places. WILLIAM KENRICK. Nonantum Hill, Newton, Mass. Oct. 9.

PEAR TREES.

For sale at the garden of the subscriber a large collection of Standard and Dwarf Pear Trees comprising most of the choice varieties of European and American origin. Orders by mail will be immediately answered. October 16. ROBERT MANNING.

MISCELLANEOUS.

THE TWO APPLE TREES.

A rich husbandman had two sons, the one exactly a year older than the other. The very day the second was born, he had set in the entrance of his orchard, two young apple trees, equal in size, which he had since cultivated with the same care, and which had thriven so equally, that nobody could give the preference to one of them before the other.

When his children were capable of handing garden tools, he took them, one fine spring day, to see these two trees which he had planted for them, and called after their names. When they had sufficiently admired their fine growth, and the number of blossoms that covered them, he said, "You see, children, I give you these trees in good condition. They will thrive as much by your care, as they will lose by your negligence, and their fruit will reward you in proportion to your labor."

The youngest, named Edmund, was indefatigable in his attention. He was all that day busy in clearing his tree of insects that would have hurt it, and he propped up its stem to hinder it from taking an ugly bend. He loosened the earth all round it, that the warmth of the sun and the moisture of the dews might cherish its roots. His mother had not tended him more carefully in his infancy, than he did his young apple tree.

His brother Moses did none of all this. He spent his time on a mount that was hard by, throwing stones from it at passengers in the road. He went among all the idle country boys in the neighborhood, to box with them; so that he was always seen with broken shins and black eyes, from the blows and kicks he received in his quarrels. He neglected his tree so far, in short he never once thought of it, till one day in autumn he by chance saw Edmund's tree so full of apples, streaked with purple and gold, that were it not for the props which supported its branches, the weight of its fruit must have bent it to the ground.

Struck with the sight of so fine a growth, he ran to his own, hoping to find as large a crop on it; but what was his surprise, when he saw nothing but branches covered with moss, and a few yellow leaves! Quite angry and jealous, he went to his father, and said, "Father, what sort of a tree is this that you have given me? It is as dry as a broomstick, and I shall not have ten apples on it. But my brother!—Oh! you have used him better. Bid him, at least, share his apples with me."

"Share with you," said his father; "so the industrious would lose his labor to feed the idle.—Take what you get; it is the reward of your negligence, and do not think to accuse me of injustice when you see your brother's rich crop. Your tree was as fruitful and in as good order as his. It bore as many blossoms, and grew in the same soil; only it had not the same usage. Edmund has kept his tree clear even of the smallest insects; you have suffered them to eat up yours in its blossom.

As I do not choose to let any thing God has given me, and for which I hold myself accountable to him, go to ruin, I take this tree from you, and call it no more by your name. It must pass through your brother's hands, to recover itself, and is his property from this moment, as well as the fruit he shall make it bear. You may go and look for another in my nursery, and rear it, if you will, to make amends for your fault; but if you neglect it, that too shall belong to your brother for assisting me in my labor."

Moses felt the justice of his father's sentence, and the wisdom of his design. He went that moment and chose in the nursery the most thrifty young apple tree that he could find. Edmund assisted him with his advice in rearing it, and Moses did not lose a moment. He was never out of humor, now, with his comrades, and still less with himself; for he applied cheerfully to work, and in autumn, he saw his tree fully answer his hopes.

Thus he had the double advantage of enriching himself with a plentiful growth of fruit, and at the same time, of getting rid of the vicious habits which he had contracted. His father was so well pleased with this change, that the following year he shared the produce of a small orchard, between him and his brother.

The Farmer's Cabinet says that the sugar beet is superior to any thing else for the fattening of sheep. Mutton which has been brought into Philadelphia market, by several farmers, fed on the sugar beet, hay, and a small portion of corn, commands an extra price, as the meat is more juicy than any other, and exceedingly tender.

Speculation.—A young man in an adjoining town was mightily smitten with the beauty of a lady whose father had a suit at law which must forever make or break him, and "popped the question."—She answered in the affirmative, and was expressing a desire for immediate marriage, when he thus interrupted her—"I can have the refusal of you for six months, can't I?"

The Providence Journal mentions a Rohan potato received at that office, which weighs 34 1-2 oz.

The Barnstable Patriot tells a monstrous pumpkin story, viz: that Capt. Peter Baker, of South Dennis, raised in his farm the past season, from one seed, 714 1-2 lbs. of pumpkins!

An Irishman said the hard hearted priests, instead of the tenth, would if they dared, take the twentieth of a poor man's earnings, and so keep on doubling.

The news of the battle of Bunker Hill was four days in getting to Newport, R. I. Passengers are now conveyed from Boston to Newport in about four hours.

The Atlas states that Massachusetts has lost more officers in the Florida war than any other State in the Union. So she did in the war of the revolution.—*Trav.*

Humane.—A society is about being established, the object of which is to discourage the use of figs and old cheese; it having been ascertained that we deprive a great many innocent little creatures of life every time we indulge in those luxuries.

The city of Mobile has been placed under martial law. The panic and excitement in consequence of the late successful attempts to burn the city, have been beyond all parallel. Several persons have been arrested under circumstances which make it almost certain that they were among the incendiaries who fired the city.

A man in Coventry, N. H. has fifteen children whose aggregate length is upwards of ninety feet!

A homicide of rather a singular character was perpetrated last Thursday, near Syracuse, N. Y.—A pedler, bending under the weight of his pack, encountered on one of the by-roads of that region foot pad who demanded his money. The pedler handed out his pocket book. "Is that all?" asked the robber. "No," said the pedler. "Well the fork up, and be quick." The pedler put his hand in his bosom, drew out a pistol, and shot the robber through the heart. The body was recognized as that of a convict just discharged from the Auburn prison.

It is estimated that during the month of October \$4,000,000 of property was consumed by fire in the United States.

The New Orleans papers generally express the opinion that there exists an organized plot to reduce the cities of the south west to ashes.

WINSHIP'S BRIGHTON NURSERIES, AND BOTANIC GARDENS. Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c. Orders addressed to Messrs WINSHIP, Brighton, Mass., will be promptly executed and forwarded to any part of this or other countries. April 10.

GREEN'S PATENT STRAW CUTTER. JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay, Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most powerful effects of this application, and some of the consequent peculiarities of the machine are: 1. So great a reduction of the quantum of power required to use it, that the strength of a half grown boy is sufficient to work it very efficiently. 2. With even this moderate power, it easily cuts two bundles a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power. 3. The knives, owing to the peculiar manner in which cut, require sharpening less often than those of any other straw cutter. 4. The machine is simple in its construction, made put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

ROHAN POTATOES. For sale at the New England Agricultural Warehouse Seed Store, No. 52 North Market Street, at \$5 per barrel October 16. JOSEPH BRECK & CO.

Fruit and Ornamental Trees, Flowering Shrubs, Plants, &c. The present being the most favorable season for transplanting all hardy trees and shrubs, we would remind those who are in want of Fruit or Ornamental Trees, Shrubs, Herbaceous Plants, &c. that we can furnish them at short notice at nursery prices, well packed for transportation any part of the country. JOSEPH BRECK & CO. October 15.

MORUS MULTICAULIS. 6000 Multicaulis from 2 to 4 feet high, wood well ripened now standing in the field on the Jones' Place in Angell Street, half a mile from the Providence Market, for sale low (if taken in the field) by JOSEPH STETSON on the premises or on application to STIMSON & HODGES Providence, October 23.

THE NEW ENGLAND FARMER. Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay weekly days from the time of subscribing are entitled to a deduction of 50 cents.

TUTTLE, DENNETT AND CHISHOLM, PRINTERS 17 SCHOOL STREET, BOSTON

AGRICULTURAL.

WORCESTER AGRICULTURAL SOCIETY.

Committee on all other Manufactured Articles.

Benjamin F. Thomas, Worcester, Chairman; Im G. Thurston, Lancaster; Samuel Wood, Grafton; George C. Davis, Northboro'; John Boynton, Templeton; Horace B. Claffin, Worcester; Charles C. Barre; John P. Kettell, Worcester.

The servants of the society, rejoicing in the cause and definite appellation of the "Committee on all other manufactured articles," having attended the duty assigned them, respectfully report:

Of the articles coming within the province of our committee, and for excellence in which premiums are offered by the society, the number was smaller, and the quality not equal, to those of some preceding years.

No specimens of linen or tow diaper were exhibited. Two linen table cloths, of a good quality, were sent to the exhibition by Mrs. Hannah Gibbs, Boyiston, and the committee recommend a gratuity to her of \$1.

In relation to the finest grass bonnet, the committee found no great trouble in forming their judgment, one only being exhibited, and this by Miss Arriet P. Dana, of Oxford; for which a premium of \$5 is awarded her.

Two straw bonnets only were exhibited—one by Mrs. Parmenter, of Worcester, the other by Lydia Nichols, of Charlton. The committee, after much deliberation, were unable to decide which was best; they, therefore, concluded to recommend that the premium of \$3 be equally divided between them.

The premium of \$2 for the best palm leaf hat is awarded to Miss Sarah Fiske, of Worcester. Other palm leaf hats, of a fair quality, were offered by Miss Elizabeth H. Childs, of Barre, and Miss Eunice Williams, of Worcester.

Of fur, wool, or silk hats, only one lot was entered at the time when the premiums were awarded. This consisted of good plain brush hats, by John W. Kettell, of Worcester, to whom the committee awarded the highest premium of \$3. Some of a good quality were afterwards sent by Leonard & Tyler, of Worcester, and three of mole skin, well made and beautifully finished, by Nathaniel Tead, of Worcester. Very fine fur caps were also exhibited by John P. Kettell.

Though the articles coming within the province of your committee, entitled to premiums, were not very numerous nor of surpassing excellence, the fruits of the industry and taste of the county, for which no regular premiums are awarded, have been equalled by those of no former exhibition.

The committee viewed with peculiar pleasure, the contribution to the exhibition by the mothers and daughters of our county. The varied and beautiful specimens of woman's skill, industry and taste, could be surpassed only by the living products that slumber in the cradle or are folded to her bosom. These varied proofs of her industry and han-

dy work, reminded us of the good old times, when our mothers sang to the music of the spinning wheel, and found, in the faithful discharge of their labors at home, their highest duty and their truest pleasure; before the march of mind had taught woman to unsex herself in the arena of politics, and to order up her refinement, modesty and delicacy, on the altar of an ill-judged philanthropy.

Three were specimens of fruit as beautiful as the apple that first tempted Eve; and flowers that vied with nature, save in the perfume. There were caps as nice as the shoulders they were designed to cover, and veils as pretty as the faces they were not meant to conceal. There were caps for daylight and caps for no light at all. There were beautiful socks and beautiful hose, though, as modern refinement has abolished legs, the committee could conceive no use for them, except to cover the *limbs* of a table. The coming generation seems to have been provided for by maternal care and fondness, and there were nice little socks and nice little shoes for dear little boys and sweet little girls.

The productions of the young ladies, too, were such as to satisfy the committee that the next generation, like our own, would be blessed by good and notable wives and mothers, unless our young men, following the bad example set them by some of the officers of our society, should live in violation of that divine law, which commanded man to go forth and to multiply and replenish the earth.

Mrs. S. R. May and other ladies of Leicester, exhibited a variety of beautiful little articles, such as children's socks, shoes, &c., for which the committee recommend a gratuity of \$1.

A fine lot of articles of a similar character was sent by Mrs. Elizabeth Southwick and other ladies, also of Leicester, for which the committee recommend the same gratuity, \$1, regretting, in all these cases, that they do not feel authorized to do more.

For a variety of nice articles of the same kind, a gratuity of \$1 is given to the Ladies' Benevolent Society of Worcester.

A very beautiful work bag, wrought with crucis, offered for exhibition by the excellent lady of our excellent president, was much admired by the committee.

A very pretty shell basket, made by Miss Martha P. Holbrook, of Grafton, also attracted their notice, for which they recommend a gratuity of \$1 to that lady.

A great variety of beautiful wax flowers, many of them nearly perfect imitations of nature, made by Misses E. and Lucy Earle, and Miss Woodbury, of Leicester, by Mrs. B. F. Dean, of Worcester, and though last, not least, by Mrs. Lucy Anne Dixie, of Worcester, were a great addition to the exhibition. The committee would have been glad to have recommended gratuities to these ladies, but they felt that, limited as they were in funds, what was given should be for articles of a strictly useful character.

Very beautiful and tempting looking fruit, made of the same material, was sent by Miss Phebe S. Southwick, of Leicester.

An astral lamp rug with flowers, by Miss H. Sanford, of Oxford, two pairs by Miss A. Cobleigh, of

Templeton, a shell box by Miss E. Hubbard, of Worcester, honey baskets, by Miss A. Putnam, of Grafton, attracted the favorable notice of the committee.

A black wrought lace veil, by Mrs. Silas Goddard, of Milbury, and a handkerchief of the same material by Miss Silvia Holbrook, of Worcester, were highly praised, and the committee recommend a gratuity of \$1 to each of those ladies.

Another veil was sent by Miss A. Putnam, of Grafton, which the committee thought very good.

Ladies colored lace boots, a very beautiful article, were exhibited by H. F. Burestead, of Worcester. A pretty foot in one of them, would be irresistible, even to the chief justice of pigs.

Gentlemen's slippers, wrought with crucis, were highly approved, as combining the comfortable with the beautiful. One pair, made by a young lady for the chairman of the committee of arrangements, excited a glimmer of hope in regard to that solitary officer.

A shawl wrought with silk of her own manufacture and coloring, by Miss P. W. Howland, of West Brookfield, was regarded as so creditable to her, that the committee recommend a gratuity of \$1.

Two very nice worsted pocket books, made by Mrs. M. Newton, of South Shrewsbury, aged sixty years, and cruel work by Miss E. A. Howland, of Worcester, aged 11 years, cotton hose by Mary Chase, of Sutton, wire baskets by Mrs. Southwick, of Leicester, capes by Sophia Harrington, of Spencertown, of Milbury, Miss E. Gardner, of Worcester, Miss Fay, of Oakham, and Miss J. A. Smith, of Worcester, a centre lamp rug by Miss H. N. Chamberlain, of Worcester, and a paper basket by Miss Ann E. Wilder, of Worcester, were favorably noticed.

Several articles of Britannia ware, exhibited by Messrs. Boyden & Fenno, from the Taunton Manufacturing Company, were thought in beauty of form, material and finish, to compare well with the best specimens of the English.

Chester Dickinson, of Worcester, furnished a case with umbrellas, parasols, and musical instruments of his own manufacture, which elicited warm praise from the committee. They recommend a gratuity of \$5 to that gentleman.

Some beautiful specimens of machine cards were sent by Messrs. Lamb, White & Co., of Leicester.

Knit thread caps and infants' shoes, by Miss P. M. Upham, of Leicester; wrought capes by Mrs. B. F. Dean, of Worcester and Miss Lombard, of Sutton, and wrought collars by Mrs. Patterson, of Uxbridge, were much commended.

A beautiful pair of children's mits, a pair of baby's socks, and a silk purse, were sent by Mrs. Eliza Clapp, of Leicester.

Very beautiful lady's travelling bag and bead bags, by Mrs. Southgate, of Leicester, increased the obligations felt by the committee to the ladies of that town, for their numerous and valuable contributions to the exhibition.

A worked pocket handkerchief by Louisa W. Coe, of Worcester, and a collar by Mary Coe, of the same place, were very much admired, and thought

by the committee to surpass any work of the kind in the exhibition.

Beautiful wax flowers, wrought ladies' collars, cotton hose, and fancy articles from the State Lunatic Hospital, were viewed with great pleasure, not only as an interesting addition to the exhibition, but as affording practical evidence of the blessed influences exerted by that noble charity.

W. & S. T. Coe, of Worcester, exhibited a case of medicines, perfumery, &c., so neatly and temptingly put up, that the committee seemed ready to regret the want of an occasion to try them. These gentlemen are entitled to the censure of the society for offering men such temptations to be sick.

A case full of groceries, were exhibited by E. F. Dixie, of Worcester: they looked nice; but in relation to a portion of them, the committee felt that more direct and practical proof was requisite. It is hoped that Mr Dixie is of the wise, to whom a word is sufficient.

Tabourets, wrought with cruels, by Mrs A. D. Foster, of Worcester, by Miss Mary Denny, of Worcester, and by Mrs Eliza A. Washburn, of Worcester, were universally admired as beautiful ornaments for the drawing room, and as monuments of the industry, taste, and unwearied patience of those ladies.

Cotton sheetings, of a very nice quality, were sent by Messrs H. & S. B. Chase, of Grafton: some very good by Samuel Slater & Sons, of Webster.

One hundred skeins of sewing silk were offered by Lucy Earle, of Leicester, to whom the committee recommend a gratuity of \$1.

Sewing silk of a good quality, and a lot of cocoons, were sent by Mr J. H. Moore, of Charlton.

A small bureau, of very neat workmanship, by James M. Russell, of Worcester; a lady's work-box by Seth Puffer, of Worcester; a beautiful dressing case by George Evans, of Worcester; a lady's work-box by Amos Evans, of Worcester; and one from T. W. & C. P. Bancroft, received much commendation.

Very perfect imitations of rose wood by Charles P. Chapin, of Worcester, were much admired, and the committee recommend a gratuity of \$1 to that gentleman.

A very beautiful wrought lace cape by Miss Sarah G. Davis, of Paxton, delighted the committee. They recommend that a gratuity of \$1 be given to her.

An ingenious machine for winding thread was exhibited by Mary N. Hedge, of Worcester.

Two bonnets and a cap, tastefully made by Miss M. Willey, of Worcester, attracted much notice.

A stuffed owl, a fitting representation of the cynical wisdom of the age, looked down very knowingly upon the multitude beneath.

Several portraits by George L. Brown, of Worcester, were commended highly for the beauty of their execution and their great fidelity as likenesses. Two pretty landscapes by the same excellent artist, added to the attractions of the fair.

A landscape, by Francis Wood, of Worcester, attracted much attention.

Specimens of neat and delicate paper hangings were sent from the manufactory of J. M. Barry, of Worcester.

Silver ware, beautifully finished, and gold spectacles, were offered for exhibition by Messrs Dunbar & Story, of Worcester.

A very beautiful lady's work bag, wrought with cruels, by Mrs Pratt, of Worcester, was found to be added to the exhibition this morning.

Also, two neat palm leaf hats, by Mrs Hapgood, of Harvard.

A door, made by Henry Earle, of Worcester, was regarded as a specimen of neat and finished workmanship.

The committee cannot, with any decent respect to the patience of the society, even enumerate all the beautiful articles exhibited. Though not mentioned in this report, they did not escape the notice of the crowd of visitors who thronged the hall.

They would suggest to those who may furnish articles for exhibition at a future time, to send them at an early hour the day preceding the cattle show. After the hall is opened for visitors, it is not possible for the committee to make a minute examination of the articles exhibited. They do not doubt that many articles of great merit may have been unnoticed from this cause.

Yet, after all, the noblest specimens of our domestic manufactures were the daughters of our county, who in thousands thronged this pleasant village to celebrate the farmer's holiday. The committee could not but turn from the beautiful fabrics to their more beautiful makers. Even the cold and cynical bachelors, as they gazed upon the rosy-cheeked and beautiful girls, felt the ice melt within them, and for the brief hour were human.

BENJ. P. THOMAS, Chairman.

Committee on Sheep.

Joseph Mason, Templeton, Chairman; Seth Wyman, Shrewsbury; Washington Howe, Petersham; Cyrus Gale, Northboro'; Thomas Bottomly, Leicester; Joseph Day, Uxbridge; Samuel Daman, Holden; Sylvanus Holbrook, Northbridge.

The committee appointed to award premiums on sheep, respectfully submit the following report:

Like the shepherds of antiquity, your committee feel themselves honored in having charge of a flock of sheep. We have never felt any of that antipathy for this useful and inoffensive animal, which induced a distinguished southern gentleman to say that he would go a mile out of his way to kick a sheep. On the contrary, we have always entertained feelings of kindness towards this humble, though very warm friend of mankind. Nor do we feel any sheepishness in acknowledging our dependent relation to them as the receivers of their cast-off garments to cover our nakedness and protect us from the cold.

In its wild or savage state, the sheep is said to be a bold, courageous, and fleet animal, able to oppose and defend itself against other animals of its own size, or to escape by flight from those of superior strength. It is a problem that has not yet been solved, how the art of man should so change its nature and deprive it of its natural courage and boldness. As an explanation of this paradox, your committee will merely allude to the fact, that the ancient shepherds beguiled away the hours while tending their flocks, in performing on the harp or lyre some soft and simple strains of music; which fact affords a complete explanation, according to a principle laid down by the celebrated Montesquieu, that soft and plaintive music diminishes the ferocity and boldness of a people: unless, indeed, some good reason can be given why the same principle will not apply to sheep, which that learned writer has applied to men.

It would be a matter of curious inquiry, to ascertain whether with this change which has taken place in the character of the sheep, there has been

a corresponding change in its phrenological developments. This question we will refer to the phrenologists, and we hope that some of them will examine the subject and report before the next cattle show. It is to be presumed that there will be found a great depression of the organ of destructiveness, and an unusual elevation of the organ of sheepishness.

A sheep should be judged of like a dandy, by the fineness of his coat. We beg pardon of the shearer for the comparison—but it is so apt! In both cases, the coat is the most important part of the animal. What is a sheep good for without a fleece, or what is a dandy good for without a coat?

Some of the sheep examined by your committee were of a superior quality. They were of different bloods of Merino, Dishley, and Saxony, mixed with that of the native sheep. None, however, were presented with a golden fleece, like that which Jason obtained in the celebrated Argonaut expedition; and it is the opinion of your committee, that that species of sheep is entirely extinct at least, it is unknown in the county of Worcester. We think, that if another should be discovered these days, it would be kept to perpetuate the stock, instead of being sacrificed to either Jupiter or Mars; and that enough would be found to content for the fleece, even though guarded by the bulls with brazen hoofs and horns, and the armed men and the sleepless dragon.

Your committee can express no opinion as to the best mixtures of blood for the wool grower to obtain. That must be determined by a variety of circumstances. In connexion with this subject, however, we will mention a very excellent suggestion of a good farmer's wife, somewhere in Vermont, who, having been put to some inconvenience to procure some cotton to mix with her wool for domestic manufacture, advised her husband to get a *cotton ram*, so that they might have cotton and wool ready mixed, from their own flock.

Your committee awarded to Thomas W. Ward the premium of seven dollars for the best Merino ram. No other ram was presented that, by the rules of the society, could be considered as his competitor. Four Saxony bucks were presented to Rejoice Newton, Esq., of Worcester; but as a premium is offered by the society for Saxony bucks we can merely certify to all whom it may concern that they had very fine wool and very large horns.

The best Merino ewes were presented by Messrs Francis Strong and Charles Hadwin, of Worcester and your committee accordingly awarded to them the premium of eight dollars, which is offered by the society. The premium of four dollars for the next best Merino ewes, was awarded to William Thompson, of Oakham. The wool of these ewes was of a very superior quality, and had some appearance of being a mixture of Merino and Saxony.

The only mixed Merino sheep presented for premium were five ewes belonging to Thomas V. Ward, of Shrewsbury. They were a mixture of Merino and Bakewell breeds, and both on account of their size and the quality of the wool, entitled the owner, in the opinion of the committee, to the premium of five dollars, which was accordingly awarded to him.

The premium of five dollars for the best native ram, was awarded to Hollon Maynard, of Northboro'. This ram is reputed to be two years old; although he had rather a *nutton-headed* expression, on the whole, a very fine fellow, and did not discredit to the place of his nativity.

Marshall Pratt, of Oxford, presented a large and fine looking ram, which your committee found *sty sheep's eyes* at a beautiful Dishley ewe in a same pen. The gallant fellow was a little discolored by our plucking a lock of wool from his side, an examination of which satisfied the committee it instead of being purely native, he had some mixed blood.

A native buck was presented by Daniel Tenney, q., of Sutton, and also by Joshua Eveleigh, of Princeton; but, though good, they were unequal to that of Mr Pratt.

Daniel Tenney, Esq., of Sutton, presented four ewes, and no others being presented, your committee had no hesitation in awarding to him a premium of four dollars.

There were two claimants for the premium for the best native wethers. Those presented by George Pratt, of Oxford, were very fine; but, after debate and much grave consideration, the committee resolved that the two native wethers of John Whitney, of Princeton, were the best, and before awarded to him the premium of three dollars.

Three rams of the Dishley breed were presented for a premium—two very clever ones by Seth Blanchard, belonging to the society of Shakers, in Harvard; but the largest and best of the three, was one presented by Edward Warren, of Northboro'. He had no horns, but his tail was as broad as a pillow, and would do admirably for the lambs lay their heads on when they lay down to sleep; therefore, after due deliberation, the committee awarded to Edward Warren the premium for the best ram of the Dishley breed.

Your committee did not award to any one the premium for the two best ewes of the Dishley breed, as sheep were presented for this premium by Nathan P. Dana, of Oxford; but, on examination, we were of opinion that they were a mixed breed, and had but little Dishley blood in their veins.

Several other very good sheep were presented for exhibition.

On the whole, the superior quality of the sheep presented both for premiums and exhibition, shows an influence which this society has exerted in improving the breed of sheep, as well as the general interest among the farmers in this subject.

All which is respectfully submitted by your committee.

JOSEPH MASON, *Chairman.*

Committee on Working Oxen.

David Henshaw, Leicester, Chairman; Benjamin Moore, Northboro'; Phineas Gleason, Westboro'; Stephen Howe, Paxton; John Whitney, Princeton; Warren Humes, Douglas; Solon Hastings, Sterling.

The committee on Working Oxen having attended to the duty assigned them, beg leave to report: That the drawing matches, the trials of strength and docility, took place at the time appointed, immediately after the address was delivered.

The several teams entered for the premiums each drew the load of thirty-five hundred pounds weight including the cart, up an ascent of about twenty feet, a distance of about thirty rods, turned the cart round, descended the hill half way, then backed the load part way up the hill, and again descended to the starting place.

The teams that drew the load up with the least

apparent exertion, that moved it with the most facility, and were most obedient to the commands of the driver, taking into view the age of the team, were considered as entitled to the premiums.

Seventeen teams competed for the premiums, viz. the team of

Daniel Tenney, Sutton,	1 pair of 4 yrs. old.
Royal Keith, Grafton,	do " "
Henry Johnson, Milbury,	do " "
Nathaniel Dodge, Sutton,	do " "
Paul Goodale, Worcester,	do 5 yrs. old.
Nathl C. Moore, " "	do " "
Joseph Bullard, Holden,	do 4 yrs. old.
Simon Carpenter, Charlton,	do 5 " "
Elbridge G. Wheelock, Milbury,	do 4 " "
George W. Spurr, Charlton,	do 7 " "
Marshall Pratt, Oxford,	do 5 " "
David Carpenter, Charlton,	do " " "
David W. Carpenter, " "	do 4 " "
Putnam King, Sutton,	do 6 " "
Simon Fuller, " "	do 5 " "
Stephen Marsh, jr. " "	do 4 " "
Reuben Sibley, " "	do " " "

The committee were greatly perplexed in awarding the premiums satisfactorily to themselves, owing to the very close competition and the slight difference between the performances of those that received, and those that did not gain the premiums. The committee noticed with pleasure that they had never before seen the like number of teams together, that appeared so well and performed so well.

After much deliberation, however, the committee have awarded the first premium to

Daniel Tenney, Sutton,	\$12
Stephen Marsh, jr., Sutton, second,	10
David W. Carpenter, Charlton, third,	8
Elbridge G. Wheelock, Milbury, fourth,	5

The committee likewise examined a team of seventy-four yokes of Working Oxen, all from the town of Sutton. It was a highly gratifying exhibition—the oxen were generally young, in good condition, and well broke—there was not in the whole team, what could be called an inferior yoke of cattle. It afforded most credible proof of the enterprise and well directed industry of the inhabitants of that large and thrifty agricultural town, and added character to the whole exhibition of the day.

The committee recommend that the premium of seventy-five dollars, offered by the society, be paid for this team.

The committee also examined a team of six yokes of fine looking and well trained oxen, from the farm of David Carpenter, of Charlton.

And also one of five yokes of excellent and well trained oxen from the farm of Simon Carpenter, of Charlton.

They recommend a gratuity to each of these gentlemen, for the exhibition of their teams, of five dollars.

By order of the Committee,
DAVID HENSILAW, *Chairman.*

PEACH TREES.

About three years ago, I wrote an article upon this subject for your paper, and recommended coal ashes to be placed about the trees for their preservation. So fully persuaded was I of their usefulness in giving vigor to the tree and preserving it from the attacks of worms, that in the spring of 1838, I applied it again to my trees, but the results were not so favorable as I anticipated. A hole large enough to contain about three shovels full, was dug around the root, and this filled up with

ashes which were perfectly dry, and the trees were afterwards white-washed. If the ashes had been damp, the results might have been different. This was done just as the buds were bursting. The consequence was that there appeared to be a check or absorption of the sap. The blossoms were slow in opening and remained for a long time upon the trees, but notwithstanding, I had an abundant crop of fine fruit. The trees, however, were manifestly injured, but as I was making an experiment, I determined to allow the ashes to remain, to see the effect during this season. They continued to decline during this summer, and had much dead wood upon them. Their leaves were yellow, they bore no fruit, and I was finally convinced that I would not have a living tree next spring if I persisted in my experiment. I therefore about the first of August, had the ashes carefully removed, and the worms destroyed. The holes were then filled up with short bog manure, and this covered up with earth. The beneficial results are very manifest. The foliage is now rapidly changing its sickly yellow color for a luxuriant growth of dark green, and I feel confident from present indications, that most of them will soon be restored to vigorous health.

The peach is so delicious a fruit, and the cultivation of it has been attended with so many difficulties in this county, that I regard anything which may be calculated to remove them, as too important to be withheld from the community, and as I am satisfied that the application of manure to the root will, in most instances, restore a sickly tree to health when the trunk is not too much injured by worms or other causes, I recommend those whose trees may require it, to adopt the means which I think I have successfully used.—*German-town Telegraph.* PENN.

From the Franklin Farmer.

BREEDING AND REARING SWINE.

For economy, I would advise the farming community to select out of their herd of swine, every spring, as many female pigs as they may think will produce them as many pigs as they may be prepared to rear through the winter for family or market use, and to have this lot of young sows kept in a lot sufficiently close to prevent males from getting to them. Should the grazing on the blue grass or clover not be sufficient to keep them in a good healthy growing condition, I would advise a small proportion of corn, given regularly morn and noon, to assist their regular growth. And as I have, from my own experience with a lot of eleven head, having only ordinary blue grass woodland pasture, made a regular practice morn and noon, of giving them 8 or 10 ears of corn at a feed, I can say with safety, by so doing you will be well paid for your husbandry. Your sows will have health, good sleek coats of hair and good stamina, and they will not be hurried in their growth—then the animals will be much more capable of propagating. Young sows kept in this way, will weigh from 120 to 160 lbs. when about 8 months old.

Sows are susceptible of conceiving when 4 or 5 months old; but for better size and form, I would recommend not to breed them until they are about 8 months old, that their first littering will be when they are about 12 months of age. Sows impregnated from the 20th to the last of December, will bring pigs from the 10th to the 30th of April, as the period of gestation is about 112 days. I have a num-

per on a record of the above age, and find that a litter to be from 8 to 13 pigs a litter.—I know the usual wants of the farmers, by being more frequently observed, by their firesides, that no large stock of pigs to come the first of March, and at the same time, unconscious of the danger of severe storms and cold blasts in March—of the little economy they have in providing shelters for their sows—frequently lose their entire stock of pigs, which is of no small value to a farmer that has his plan laid out to rear a great number of hogs, consequently must buy a stock or sell their grain at reduced price. I have experienced the loss more than once, on a considerable amount, consequently I have postponed breeding, as before mentioned.—Thus I have the security of better weather and the benefit of vegetation, which has a good tendency to correct any indisposition in sows, which frequently occurs in animals, as well as human beings. They are subject to influenza, and colds, and fever succeeding, dries up their milk, the pigs perish and death intervenes. To insure the farmer a quick and rapid growth in his lot of pigs, let them come about the last of April (say 20th) which is far preferable to March pigs, which have sustained much injury while very young, stunted by frost and hunger, they cannot be well resuscitated by the best of attention afterwards.

In an ordinary way, sows suckle their young in the spring from six to eight weeks, but in the fall the sows frequently wean their young in about six weeks. I would say, to make your pigs thrive and grow on without much injury in their litters from weaning time, the better way is to prepare a covered pen for your pigs, and have a hole sufficiently large so they can go in and out at pleasure, and always keep shelled corn by them.—Be particular to commence this weaning when they are about three weeks old, and it will aid the sow in rearing them—consequently they will wean them kindly and grow on without any ill effects which are common to weaning. These pigs will have age and sufficient growth by good clover and blue grass—will winter kindly, which will insure the farmer a regular growth in his lot of hogs by the common mode of corn feeding, or following corn-fed cattle, the excrements they collect from them, and soot or cooked or steamed milk.—After weaning their litter of pigs, I would advise all the old sows to be spayed, while reduced in flesh by suckling, as the spayed is most favorable. A careful hand performing the operation in the left side, I seldom or never lose any of that age and healthy rearing.—They will fatten kindly, and make about as much weight at selling time as their brothers of the same litter.

You now perceive I do not winter any hogs more than one winter. I can say from experience, that sows with pig winter better than hares.—They should be kept in a large woodland pasture, if practicable, by themselves, to prevent any injury from other hogs. Be careful to have a house or shelter to protect them in inclement weather.—Continue to select every spring the best female pigs out of your litters, as many as you may think will produce as many pigs as you may want to breed from, and by so doing you may rear your hogs on your farm at a moderate calculation of 20 per cent, over and above the prevailing prices of the day. As in the common way the farmer has his males and females running together at large, then they may expect to have litters of pigs every month in the year; the unevenness of the lot of hogs, and consequently the stronger will be certain to abuse the

weak, (hog is a hog by nature) and live out naturally in the woods, and in all cases the weaker are driven from food and comfortable shelter in the forest; and in many cases we have a proof of the inferiority of our rural system of our farmers, by having all sows and ages. In our rural waters we see the small class of hogs, when pinched with cold, deep snows and wet weather, fall victims of death by smothering and suppression by the large class being with the small ones.—On all occasions hogs ought to be separated and classed according to size, and kept in the woodland pastures, where they may provide shelter in the forest lodging.—Every farmer should provide himself with log-houses in his woodland pastures, where they can get the foliage of the forest to make their beds.—The best place for these houses should be selected on the south or rather east side of a hill, so as to receive the warmth of the sun in the winter, and on a moderate slope, so as to drain off the water, and that the sun may the better dry and warm the earth.—As to form I am not particular, but always recommend the shelter to be close and dry; to and in keeping dry in any case should be observed, in trenching about the house to turn the water.

Rearing a herd of blooded female sows in spring and summer in detail: breeding and winter treatment.—They should be left in a lot sufficiently large for exercise, containing plenty of water for wallowing and shade. If the grazing is not sufficient, I would advise a little corn, dish-water, slugs and cow-suds, mixed together, to be given them, so as to keep the animals in a good healthy look, but by no means like fattening, to hurry them in their growth.

My practice for winter treatment. After my sows are all pregnant, if practicable, I always take a large field of clover or meadow for their grazing, or put them on rye or wheat fields, and let them graze about 24 hours, twice a week, when they are off the ground; always providing a comfortible dry shed or houses for them, having a regular time for feeding, (morning and evening,) and if any cold winds stand in danger from the want of regular feeding while pregnant, it is the sow; and there is no danger of their being fed too much at a time, by careless or inexperienced servants, which is apt to produce abortions.—Another cause is the severe weather on sows, snow and wet weather, when they have frequently to make their beds in the snow, and soot in mud and water—when shelters are not provided for them; this is the cause why we so often hear our farmers say all their sows have to slink their pigs, and shall have no pigs in the spring, and another cause still more particular, I have to the careful to observe: when my sows are half gone with pig, (sometimes in February) while off feed, I separate my sows and put them in lots (1 or 2 in number) to prevent from lying one upon another along in February and March, cold snowy spots, which causes them, by oppression, to miscarry.—This is the time that the greatest care should be taken with sows, as the period of littering is close at hand, for if they should miscarry, you have again to breed them, when their pigs will come late and much more lost.

Breeding of blooded Sows.—When they have returned to the age of eight months or thereabout, my practice is to breed them between the 1st and 15th December, so as to make their littering to the latter end of March, and by having shelters or houses for their littering in, I can venture breeding sooner

than I could otherwise advise. I can rear this litter and have my sows stuted to bear, and bring the second litter in and about the 1st and middle of September, so as to have time to rear them, and so they will start the ensuing winter.—Then my sows can have about a month's rest, until the 1st of December, which I very much approve of for breeding again, and by so doing I have three litters in the period of 12 months. You now see the month I prefer for my blooded sows to litter—the end of March and the 1st of April.—The second litter runs 1st to 15th September, and the third litter the latter end of March and 1st of April, which makes the period I have in mind. In stuting my sows to the bear according to the time mentioned, I have been very particular to aid my memory by committing to writing the time when they were stuted and the mode of raising. I was in the habit of doing this, as my first beginning of doing business in this way. I soon saw there was an error somewhere, and my intentions were defeated some how—as I would reserve my lot of common sows to be bred in December, so as to bring the pigs the first of April, when the weather was warm and the cold season would be to let the boar go with some twenty or thirty sows, with the expectation of having a lot of pigs of one age, and in a common way these would come in season at one time, in all probability, one third of the sows. Admit the boar to be in good health and a full flow of annual spirit and strength, he will soon by severe service be impotent, and consequently only the first few sows may be impregnated.—The sows will in all probability continue to come in season, and the boar still reducing every day, and yet his lasciviousness keep him incapable of being fruitful. Hence, I keep by experience, my sows were unproductive, some having two or three pigs, and they coming in much later than I expected, consequently I would recommend one boar to every ten sows, where you can sell your pigs of one age and of good size. Of all the animal creation that I have any acquaintance with, the boar and ram will lose their juices faster from gendering.—I will aver that a boar may be in good health and high condition of annual spirits and just let him with a lot of twenty or thirty in number, and in four weeks time he will lose one hundred pounds weight, and you may feed him with what corn he may want to eat.

My young maiden sows I hardly ever permit to be served but one time; my reason for this is that the old boars are too heavy and strong for them, he smashes them down when they are willing; if not, he hunches them with his nose, and bruises them so much that it impedes their growth forever afterwards. It is astonishing to think how they frequently support them. I disapprove under any circumstances, of letting the male to a sow more than once when he is in good order.—I recollect sending an aged male to maiden sows in all cases, to secure large, sprightly, and well formed pigs, and more prolific. I have kept a true account heretofore of this practice. I let a lot of seven sows run with the boar until they have done with him, and kept their several dates. I also had a lot of young and old sows. I let the boar out of his pound and let him serve them once a piece, and kept their several dates. There was but one out of the six that did not stand, and out of the lot of seven there were two which did not stand.—The lot of six produced from six to eleven pigs apiece, and the lot of seven did not produce as many pigs by four as the six. I kept both lots in the same manner with care, and

they answered their several dates in littering, the period of gestation being about sixteen weeks. If you stint your sows to the boar only one time and you keep her in a lot to prevent other males, and she stands, she will be very sure to bring forth from 11 to 13 days; but if permitted to run with the boar when she is in season until she is one, I have exceeded a number of instances and dates where they have varied from the set time of 11 to 11 1/2 days. This convalesces me of the injury the boar sustains, and the sows receive no benefit from his masterly strength she is constrained to do what nature does not desire, therefore the great discrepancy in the supposed period of gestation.

Particular feeding.—I have always given my sows dish-water slops, when practicable, through the winter, in a trough, sufficiently long, that they may all feed out of it without scuffling, with a pole unfastened on each end of the trough, and also to keep their feet out of the slop and keep them from fighting and slipping over the rotundity of the trough. The ammonia in the dish-water will suit impregnated sows much better than strong salt. I had twelve head last winter in the severest weather and deep snows; I never gave but three ears of corn to each head, morning and evening, and when the snow was off, my feed was from one to two ears to each head, morning and evening.

Treatment.—When in some two or three days of her littering, I always separate my sows and put them in sheds or houses by themselves; I prepare caves for their beds, if practicable, as I prefer them to straw or hay; they are light and warm, and here is no danger of the young pigs getting entangled, as they do sometimes in straw; being very weak, they die before they get to the teat; now whilst confined before littering, give them two ears of corn morning and evening, and a plenty of water until they have farrowed. After they have littered give nothing but water for 24 hours; then give two or three ears of corn night and morning, for some four or five days—never give rich slops for some four or five days before littering, for they are not in good health, but feverish, &c., and rich food will increase the fever and swell the teats, so that the pigs cannot draw them, more especially in warm weather.

I have known instances of the milk entirely drying up from fever, and the pigs die for the want of it. Our affection frequently takes precedent of reason, by giving in to supposed culls of nature, therefore many feed their sows on the richest food immediately after littering. It also produces that very injurious disease among the pigs—scours.

Treatment after the pigs are some five or ten days old.—The sows should be kept separate from each other at least ten days after littering, to secure the pigs' affections to their own mother, and to prevent them in large herds of pigs from this evil, which is so common when the sows are permitted to run and litter together. The strong pigs will suckle all the sows, for their superior strength will force the weaker and younger from their teats, and consequently soon become puny and weak, which if kept as I have described, has a good bearing to prevent them. I can say from experience, that every pig will have their own teat, and regularly as the sow calls or permits them to suckle, they will return to their own, unless forced away by the stronger. My practice is, after they have arrived at the age before mentioned, to put them in a lot of grass sufficient for their grazing and exercise, with a plenty

of shade and water, if practicable, and always keep other stocks of hogs away from them of any size, for the purpose of keeping the sows from fighting, and running over and straggling the young pigs, which is pretty generally the case if they are permitted to feed with the sows and pigs. I feed my sows while suckling with as much corn as they will eat up clean, and always if possible put the corn smooth and dry ground for them. As for economy, from experience, I can say I am well paid for my husbandry, to have hogs and sows for winter feeding. My summer and fall feeding of slops to my sows while suckling their pigs, is done in the following described manner: have two barrels or tubs placed convenient to the troughs, then put into each barrel two pecks of rye and one peck of corn meal, one of wheat bran, then fill the barrels with kitchen slops and soap suds; when not enough of this, make up the deficiency with water, frequently stirring it with a paddle, and in 24 hours by a summer heat it will be about as acid as common still beer. Commence slopping out of one tub the first day, leaving some of the slop in the tub to retain the acid for quick fermentation; the same evening fill up this tub again for the third day; now commence slopping the second day out of the tub, and re-fill in the evening as you did the first; now you have both your tubs fermented and a body of acid in them, you must keep it up by filling one every three days; renew the meal and bran every two or three days by putting in one peck of the three kind mixed together in each tub, in the same proportion to the first put in. From this quantity I fed five aged sows and thirty-one pigs three times every day, which took about twenty gallons altogether, leaving in the tub about 12 gallons to fill up on. I continued slopping them in this way for seven weeks, which was about weaning time. In this time they consumed about twenty bushels, and at an average cost of 50 cts. per bushel, they cost \$10, expended in meal and bran. From these pigs I sold \$310 dollars worth, leaving me some five or six pigs on hand.

Description of the Russia hogs.—Their color is generally white, with long coarse hair, their head is long and coarsely featured, their ears are not so broad as the common variety of the country, yet longer and narrower, and come regularly to a point, projecting forward, and they do not appear to have so much command of them as other breeds; they have five length and height, their bone is large and fine, they stand well upon their piston joints and trackers; quite indolent; they are thick through the shoulders, indifferently ribbed, (or suddenly inclined down) their plate or kidney bone rather narrow and ovaling than otherwise, hams pretty good, though not so good as the Irish, Bedford or Berkshire, yet preferable to the variety; they do not graze so well as many others; they want more time to bring them into market than the above named breeds. Give them from 18 to 20 months age, they will make very large hogs; they are quite prolific, their usual number is from nine to twelve pigs a litter. I have found their cross with the named breeds to be a valuable acquisition to their grazing, aptitude to fatten, and rapid growth at the same time.

Rearing, treatment and management of thorough bred male hogs.—To ensure good size, form and fulness in their hams, straight in their stifle joints, and to give a good and regular growth, I seldom or ever suffer my boar to serve a sow until he has

arrived at the age of 8 or 10 months, and older if possible. I raise them a lot sufficiently large for exercise, and give food enough to keep them in a high state of flesh while growing; by so doing, I have no fears, from past experience, of injuring their libidinous propensities as so much objected to by aged men, who pretend to be hog growers in Kentucky. By this mode, I am satisfied that you will have stronger, more vigorous, active and regular sized pigs in every litter; and furthermore, you will find your sows in littering are not so apt to produce pigs dead, *filly* and feeble, as when got by a young or poor boar. In this way I breed them, and, according to my former view, never suffering them to run at large with spayed sows, &c. I believe by this treatment they will be good producers for ten or twelve years, if not longer. They are dangerous animals, and should not be permitted to run with horses and cattle.

This is one practice that I have adopted and shall follow, unless I see some further information from the pen of some other writer upon the subject. I am always open to conviction, and willing to receive instruction, and will not spare time, trouble and expense to procure correct principles. I should be pleased to see some writer who has the weight and benefit of years and experience on his side, that I might look up to as a son to a father, for further information, as I am but yet in the morning of life. I feel much delectacy in coming out in the columns of a public agricultural work, but still, from solicitation, and as a friend to the cause of agricultural pursuits, I have ventured. We find recorded in the book of Genesis, chapter 3d, verse 23d, one of the first commands that God gave to man—"to till the ground from whence he was taken."

JAS. E. LETTON.

Millersburg, Ky.

From the Farmer's Monthly Visitor.

RUTA BAGA AND THE GARDEN FLEA.

MR. EDITOR.—I believe it is a principle at common law that no man shall profit by his own misdoings; but laws are not always just, and there are few principles which do not admit of exceptions.

Last spring I planted about half an acre of Ruta Baga on land that was manured with long manure from the barn yard, and before the plants got fairly started the weeds got ahead of them, and being busy about other matters, I neglected to hoe them until they were completely overrun with weeds, and seeing my neighbors' plants entirely devoured with the garden flea, I felt but little disposition to neglect other work to weed mine, from the impression they would meet the same fate. One day I discovered a few straggling plants making their way through a thin spot of weeds, which induced me to examine the piece. I found the plants to be perfect and entire, not one having been molested by an insect of any description. I hoed and thinned them out, and in ten days I had the handsomest and forwardest yard of turnips in the town, and I have no doubt that by my negligence in not hoeing them, I have gained over one hundred bushels of fine roots. Many of my neighbors will not have forty bushels from a piece as large as mine, while I shall probably get two hundred. I would therefore suggest whether neglecting to weed turnip plants until the 20th or 25th of July, will not prove an effectual safeguard against the depredations of those insect intruders.

CARROTS AND RUTA BAGA.

The product of these crops is not so large in this State as to require much expense or pains in their preservation. An acre of ruta baga or carrots is, upon the whole, a large quantity for any one farm. As yet our farmers in the cultivation of roots for stock, act slowly feeling their way. We hope they will come right at last; and that small experiments will encourage them to extend the cultivation. They will presently learn that for keeping-stock, there are many much more profitable crops than English hay at a ton or a ton and a half to an acre; and by turning their attention to other crops, by which they will have it in their power to keep much more stock, they will increase their manure heaps and in this way quadruple, in some cases increase ten fold, the productiveness of their farms.

An acre in carrots may be easily made to yield six hundred bushels. In the estimate of an experienced and excellent farmer in Berkshire county, half carrots and half oats are as good feed for a horse as all oats; or rather to use his own expression, he would prefer one hundred bushels of carrots and one hundred bushels of oats to two hundred bushels of oats for his horses. The experience of a distinguished farmer in England, in the practice of keeping eighty horses on his farm and in his colliery, entirely confirms this statement. Now a bushel of carrots a day with chopped straw or salt hay, would, we have no doubt, keep a work horse in high condition, though it would probably be much better in the case to give him in lieu of so many carrots, some grain or meal.

Half a bushel of carrots per day, however, at twenty-five cents per bushel, cut off from the allowance made above, would pay for an allowance of a peck of oats per day to a horse. Upon the supposition then, of his being kept in the stable six months or one hundred and eighty-three days in a season, an acre of carrots yielding six hundred bushels to the acre, supposing one-half to be sold at twenty-five cents per bushel and the money expended in oats at thirty-seven and a half cents per bushel, to eat with the carrots, would considerably more than furnish three horses with half a bushel of carrots each per day and two bushels of oats per week, or more than in a peck of oats per day besides the half bushel of carrots. Under this feed a horse would require very little lung feed of any kind to keep him in good condition.

Now on the other hand, suppose the horse has English hay, and if he is worked he ought to have as many oats as in the former case, besides, one horse will consume in that time, at twenty-five pounds per day, not less than two tons and a quarter, or the three, six tons and three-quarters: and this can hardly be obtained from less than seven acres of land of ordinary yield. The horses will not, in the next place, be by any means in so good condition; and the manure made from this feed of not half the value as that made in the other case.

This, many will say, a remarkable statement, but it is well founded and not at all exaggerated. In other respects it deserves particular consideration. There cannot be a doubt of the advantages, to our animals, in respect to health and comfort, which the use of succulent vegetables in some proportions, would have over the dry feed, which we are accustomed in our present mode of keeping to give them in the winter season.

We might go on to speak of the green vegetables for stock in winter; the sugar beet, the ruta baga, the para-

nip, &c. &c., but it does not come within our design to treat this subject more fully at this time.

Our intention now was merely to speak of the mode of preserving these vegetables through the winter. We say then distinctly and emphatically, that neither ruta baga, nor turnips, nor cabbages should ever under any circumstances be put in any considerable quantities in the house cellar. The least decay produces an offensive odor and poisons the air of the cellar and of the house. Carrots and beets are by no means so bad, but they, if placed in large heaps, are liable to become heated and to decay; or otherwise to sprout, when their nutritive powers are of course lessened.

We have kept them well in several cases, and often known them kept well by others, by pitting them in a field thus. Take a dry knoll near where they are to be raised; dig a trench about a foot deep, lengthwise north and south; and of such width as you choose, and then after the tops of your carrots and ruta baga are cut off, put them into this trench, piling them up as high as they will lay, in the form of a house roof—do this when they are dry; then put in a light layer of straw and cover it lightly with dirt, piercing some holes in the top of the heap with a crow bar, to let off the steam; and so let them remain until the severe frosts are about setting in; then put on another covering of straw and a thick covering of earth, fastening up the south end with several bundles of straw, which can be removed at pleasure. They may be put up in heaps of one, two or three hundred bushels, or more, as may be desired. They will keep well in this way, and in pleasant days they may be got at without inconvenience at any time as you may want them for your live stock. You must be careful to see that there is an escape for the steam after they are first put up, otherwise they may disappear without your suspicion and very much to your chagrin. H. C.

MORUS MULTICAULIS.

The *Morus Multicaulis* speculation is now at an end, at least for the present. It is, in common parlance, flat upon its back; and whether it can be made to stand again of itself, or be held up upon crutches, remains to be seen. It has fallen suddenly like a tremendous Colossus; and it now lies sprawling with a good many under it, who are crushed by its fall. Some are quite dead; others may crawl out with only some of their limbs broken; others may by careful surgical skill, be restored again to soundness, if such skill should fortunately be at hand; but vast numbers have fallen like those who were revolving in the halls, which the giant in the old testament pulled down over their heads. We have no pleasure in contemplating these wrecks of hope; these enterprises of avarice stimulated to an intensity which never can be reached without our integrity as well as our happiness being put in extreme peril. In all such cases the reaction is extreme—the ebb corresponds to the flood. The country in many parts is covered with the *Multicaulis* almost as thickly as most wheat stubbles are with the Roman wormwood; and prices have gone down next to the point of giving away.

Some years since, in Boston, when the marketing was brought to town in paniers slung across the horse, wild pigeons were in such abundance, that a farmer who had come to market with his panniers full of pigeons, after selling as many as he could for a penny a dozen, at length in despair went away, leaving his horse, in hopes that some person would steal what remained unsold. But judge of his surprise, when on returning to his horse, he found that some other marketer as unfortunate as himself, had turned his load upon what he had left. It has not yet quite come to this with the Multi-

caulis, although they have been sold in quantities a public sale, at four cents and at two cents per tree; and then the sale was stopped for want of any further bids.

This is certainly greatly undervaluing them. They are a plant of inestimable value to the country. They yield an abundant foliage. The worms consume them with avidity; and they have not, as many feared, proved unhealthful. The silk produced by them is of excellent quality. They will not endure our rigid winters; but the taking them up and storing them in the cellars, or covering them up in the fields, is not an affair of any great labor or trouble; and the extra labor is amply compensated by the ease of picking the leaves from low shrubs compared with the difficulty of gathering leaves from high standard trees.

We have a right to hope, therefore, that the public judgment will at length do them full justice; and although they cannot be expected to go as high as they have heretofore been sold, yet they will bring such a price as will fully pay for cultivating them; and be obtained so reasonably that the growers will be warranted in making plantations of them for the purpose of raising silk.

Our only fear is that the disappointments which many must experience in failing to realize the brilliant prices which their heated imaginations anticipated, may disgust many with the whole matter, and operate to produce prejudices against the business of raising silk. This will be a great evil; for in our humble opinion the raising of silk in New England may presently become almost as valuable an interest as the raising of cotton in one of the Southern States. When we have a little leisure and an opportunity of looking at the documents, we design to give a history, little known to most persons, of what was done for the encouragement and advancement of this business many years ago and long before the American Revolution. H. C.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Nov. 2, 1839.

Dr James Jackson exhibited fine specimens of Coffin's Virgalieu's Pears; also Passe Colmar, Grosanne and Green Sugar do.

Henry Corse, Esq., our attentive correspondent at Montreal, sent Upper Canada Seedling, a very dark red apple, of medium size and oblong form; St Lawrence—this fruit is in perfection in September, but it retained a fine flavor; Fameuse or d'Neige, a well known fruit; Seedling Crab apples, of large size and remarkably beautiful; St. Antoine, Golden Renette and another seedling.

Mr J. F. Allen, Salem, exhibited large specimens of Beurre Dief and Chaumontelle Pears, and also a variety, name unknown.

Mr Manning exhibited the Minister apple, a handsome striped fruit—firm oblong—the size above medium. This fruit sustains a very high reputation.

For the Committee,

E. M. RICHARDS.

Great Yield of Onions—Mr Moses Greenleaf, of Bolton, Mass. has raised this year on 33 1-2 rods of ground, 152 bushels of White Portugal Onions, which is at the rate of 735 bushels per acre. The ground was measured by one of his neighbors, and we have no doubt but the onions were properly measured. We saw the crop before it was gathered, and can say we never saw a finer and more productive crop. J. B.

Wool Duty—The value thereof at the place of exportation shall not exceed 8 cents per lb. free. All thereof the value exceeds 8 cents per lb. 40 cent per ad. val. and 4 cents per lb.

Some few sales of fleece and pulled have been made during the week, but nothing like the ordinary demand existing, and where sales are effected they are made at quite a reduction on former prices. The stagnation in this business is owing partly to the scarcity of money and partly to the fact that nearly or quite one half of the woollen machinery in New England is not in operation. We will be started again until the woollen business improves. We omit quotations as there are no fixed prices for the article.

BRIGHTON MARKET.—Monday, Nov. 11, 1839.

Reported for the New England Farmer.

At Market 1100 Beef Cattle, 850 Stores, 2700 Sheep and 1250 Swine.

Prices—Beef Cattle.—First quality, \$6 75 a \$7 00. Second quality, \$5 75 a \$6 25. Third quality, \$4 50 a \$5 25.

Barrelling Cattle.—A sufficient number were not purchased to establish prices.

Stores.—Sales dull; very few purchasers at market, probably on account of the election. We quote Stores \$10 a \$13. Two Year Old \$15 a \$26.

Sheep.—Lots were taken at \$1 50, \$1 62, \$1 81, \$2 00, \$2 25, and \$2 50.

Swine.—Lots were sold to peddle at 4, 4 1-4 and 1-2 for sows and 5, 5 1-4 and 5 1-2 for barrows. At retail 5 a 5 1-2 for sows, and 6 a 6 1-2 for barrows. There was a lot of Berkshire shots at market, some of which were full blooded and sold, but we did not learn the price.

THERMOMETRICAL.

Reported for the New England Farmer.
Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded northerly exposure, week ending November 10.

IMPROVED PIGS FOR SALE.

For sale three, improved Pears of the following breeds; One half Berkshire and half Macky. One half Berkshire, quarter Macky and quarter Mocha. One half Berkshire and half a large English breed, name of known.
The above Pears are two years old; they are disposed of on account of keeping young sows for their get for breeders; they will be sold cheap if applied for soon. For terms, &c. apply to J. BRECK & CO.
November 13.

FRUIT AND ORNAMENTAL TREES, &c.

An extensive assortment of the finest varieties of Fruit Trees, and a great variety of Ornamental Trees of large size. A fine collection of Herbaceous Plants, Roses, Honey-suckles, Primroses, &c. 80,000 genuine Morus Multicaulis Trees, of large size, the growth of Virginia. Also—1000 bushels of Rohan Potatoes. Orders addressed to the subscriber will be received prompt attention.
Newton, Nov. 1, 1839. JOHN A. KENRICK.

A RARE CHANCE.

For sale. A partner wishing to withdraw from an old established Agricultural Implement and Seed Warehouse, having a good run of country custom, would be willing to dispose of his interest on liberal terms, as he is about engaging in other pursuits. To a person wishing to engage in a profitable and profitable business, having some ready capital, it is an opportunity rarely to be met with. A liberal credit will be given on most of the purchase money if properly secured. Any communications addressed to "Lafayette," New York city, will be treated strictly confidential.

GREENHOUSE GLASS.

All sizes and qualities, for sale by EORING & KUPPER, No. 10 Merchants' Row.
November 6.

SPLENDID BULBIOUS FLOWER ROOTS.

Just received by JOSEPH BRECK & CO. from Holland, a very large and well selected assortment of Dutch Bulbous Roots, among which are the following:—

HYACINTHS.—Double white, double white with red and purple eyes, double rose, double red, dark blue, light blue and yellow, single white, purple with red and purple eyes, pink, red, light and dark blue, yellow and variegated, comprising 150 varieties of choice named sorts.
TULIPS.—Fine late named sorts, fine double do., mixed single, mixed double, single and double Van Throff for forcing, Parrots, &c. &c.

CROWNS IMPERIALES.—Double red and yellow, single red and yellow, striped leaves, &c.

POLYANTHUS NARCISSES.—White, yellow, white with yellow and citron cups, and citron with yellow cups.

NARCISSES.—Orange Phoenix Sulphur Phoenix, Incomparable, Van Sion, and Tratus cantus, with double flowers; Trumpet major, Sulphur and Poeticus, with single.

JONQUILLES.—Double and single.

RANUNCULUS.—Large double red and yellow Turkey, and other varieties.

ANEMONES.—Many fine mixed and named varieties.

IRIS.—English, Persian, Spanish and Susiana.

CROCUS.—White, blue, purple, yellow, cloth of gold, striped, &c. in 25 sorts.

GLADIOLUS.—Bizantium communis, with purple, red and white flowers; Cardinalis.

LILIES.—Double and single white, striped leaved, and spotted; Caledonica, Bulifera, Martoon, Kampschatkin, Auratica, &c.

PROCEPS.—Double white Chinese, double red do., double red and double white, double purple fringed, fennel-leaved, &c.

Also—Snow Drops, Amaryllis, Tuberoses, Ornithogolus of all sorts, Arum dracunculifolius, Germanum tuberosum, Allium flavum, Hyacinthus monstruosus, phanostus, hotroudes and Belgicus of sorts; Fritillaria, Cyclamen, &c.

The above choice collection of bulbs have been selected with much care, from one of the best houses in Holland, and are offered to purchasers with great confidence, believing they will give universal satisfaction to all who will give them a fair trial. Orders should be forwarded soon, to the subscriber, No. 52 North Market Street, office of the New England Farmer. A liberal discount will be made to dealers.
October 23. JOSEPH BRECK & CO.

PEAR, PLUM, GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds;
1000 Plum Trees, of the most approved kinds and extra size—many of them have borne the past season;
500 Quince Trees;
3000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pond's Seedling;
30,000 Giant Asparagus Roots;
5000 Wilmot's Early Rhubarb or Pie Plant, lately introduced;

Also—a good assortment of Goosecherries, Roses, &c. o different kinds;

All orders left at this office, or with the subscriber at Cambridge-port, or in Mr Lynch's baggage wagon box, at Gould & Howe's, No. 8 Faneuil Hall, will meet with immediate attention.
SAMUEL POND,
Cambridge port, Mass.

Fruit and Ornamental Trees, Mulberries, &c.

Fruit Trees of all the different species—The collections now offered, are of the most celebrated, and surpassing kinds. The Pears are unusually fine—the Peaches and the Cherry Trees are also fine, and in very extraordinary numbers. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses, and Herbaceous Flowering Plants, for 1839, is ready and will be sent to all who apply. In that catalogue the very best kinds of fruits, so far as proved, are particularly designated by a star.

100,000 MORUS MULTICAULIS Trees or any other reasonable quantity, or cuttings of the same, are now offered. The trees are genuine; all being raised by the subscriber, either at his Nursery here, or at his Southern Establishment a Portsmouth in Lower Virginia. Also the Elata, Cockspur and Baltham for Hedges, &c. &c. Canton, Broussa, Moretto or Alpine, and some other Mulberries, &c.

All orders will be promptly attended to, and trees when so ordered will be securely packed for safe transportation to distant places.
WILLIAM KENRICK,
Nonantum Hill, Newton, Mass. Oct. 9.

SOUTH DOWN RAMS.

5 half blood South down Rams, for sale at a reasonable price. Apply to JOSEPH BRECK & CO. New England Farmer Office.
November 6.

MISCELLANEOUS.

CLOCKS.

The first mode of measuring the lapse of time was, undoubtedly, the observation of the sun's motion. In almost all climates, the morning, noon and evening, would be readily distinguished. The Babylonians appear to be the first who obtained greater accuracy by the invention of the sun-dial, at what epoch is not exactly known; but it was evidently at a very remote period. The dial of Abaz, mentioned by Isidori, must have existed eight centuries before the Christian era; and it is a curious example of the little communication which existed in ancient times between the nations of the world, that this instrument was unknown to the Greeks, until about C. B. C. One of these Grecian sun-dials is preserved in the British Museum. It is a specimen of that it served to show the hour in one of the crossways in Athens.

A few centuries later, the Egyptians, in order to distinguish the hours at night and in cloudy weather, invented the clepsydra, or water-clock; probably a mere float, with a rod fixed upon it, like a mast, and placed in a vessel of water with a hole at the bottom; as the water ran out, the float descended, and figures marked on the rod, at proper intervals, showed the number of hours elapsed. The sand-glass, made like the modern hour glass, was also used in ancient times, as appears from a bas-relief, representing the marriage of Pelous and Thetis, in which is the figure of Morpheus, holding a glass of this construction.

The period of the invention of wheel-clocks is involved in uncertainty—some authors stating it to have been as early as the fourth, and others as late as the tenth century. The cause of this disagreement is, that the word clock has been used to designate the clepsydra and hour-glass; and probably the clocks mentioned by old chroniclers, and set down by modern authors as proofs of the antiquity of the invention, were some modifications of these instruments. Such, probably, was the clock sent by Paul I. to Pepin le Bref, in 760.

The French historians describe a clock sent to Charlemagne in 847, by Haroun al Rashid, the Caliph of the East, which struck the hours by the falling of twelve brass balls upon a bell. It had also twelve housemen, who came out, one at a time, at separate doors, which they opened and closed again. This clock must certainly have been furnished with some kind of wheel-work; but the moving power is said to have been the fall of water.

In the twelfth century, clocks moved by weights, appear to have been used in Italy; and, early in the fourteenth, one was put up in London, by Wallingford, a monk, who died in 1325, which was said to show the time with accuracy. In the year 1344, Giacomo Dondi erected at Padua, his celebrated clock, which, besides the hour of the day, showed the course of the sun in elliptic, and the places of the planets. The celebrity acquired by this clock, was the cause of great advancement in the art; almost every court in Europe was desirous of possessing a similar work, and skillful mechanics were, in consequence, induced to turn their attention to the manufacture. Its author was dignified with the surname of Horologius, which is still borne by his descendants.

A story told of Louis XI. (king of France from 1461 to 1483.) shows that the art had then made great advances. A gentleman who had lost a great

deal of money at play, stole a clock belonging to the king, and hid it in his sleeve. In a short time, the clock, which continued to go, notwithstanding its removal struck the hour, and the thief, was of course discovered. Louis, as capricious in his favors as in tyrannical, not only pardoned the culprit, but made him a present of the clock. All these instruments, though much superior to their clepsydra, and celebrated at the period of their invention for the accuracy of their movements, gave, according to our present notions, but coarse approximations to the true time. They were retarded greatly, when a particle of dust got into their works, and accelerated when cleaned. As to the minute divisions of time, they were quite useless. Tycho Brahe, an astronomer who lived in the sixteenth century, and who spared no expense or trouble in their construction, found that no dependence could be placed upon them for his observations.

The adaptation of the pendulum, by the celebrated Huygens, in 1657, at once brought clock-making to perfection. The clock, which had hitherto merely served to divide the day into periods of sufficient accuracy for the details of business, or the hours of eating or sleeping, now became the means of recording the minutest lapse of time, of showing the smallest irregularities in the apparent motion of the sun and planets, and of reducing astronomy to the exactness of mathematical reasoning. Increased skill in workmanship, has, of course, produced greater accuracy; but the pendulum is still the means of giving it effect.

DR FRANKLIN AND LEGISLATIVE CHAPLAINS.

Our great American philosopher has not been usually ranked among those, who, among the renowned names of the world, can be claimed as a believer and follower of the Christian religion.—Yet, in the testimony which is annexed, and which we do not remember to have seen before, there is such proof, both of religious faith and practical wisdom, as to outweigh many vague accusations.—*New York American.*

Motion for prayers in the Convention.

MR. PRESIDENT:—The small progress we have made, after four or five weeks' close attendance and continual reasoning with each other, our different sentiments on almost every question, several of the last producing as many woes as ayes, is, methinks, a melancholy proof of the imperfection of the human understanding. We, indeed seem to feel our own want of political wisdom, since we have been running all about in search of it. We have gone back to ancient history for models of Government, and examined the different forms of those Republics, which, having been originally formed with the seeds of their own dissolution, now no longer exist; and we have viewed modern States all around Europe, but find none of their constitutions suitable to our circumstances.

In this situation of this assembly, groping, as it were in the dark to find political truth, and scarce able to distinguish it when presented to us, how has it happened, sir, that we have not hitherto once thought of applying humbly to the Father of Lights to illuminate our understanding? In the beginning of the contest with Britain, when we were sensible of danger, we had daily prayers in this room for the Divine protection. Our prayers, sir, were heard—and they were graciously answered.

All of us who were engaged in the struggle must have observed frequent instances of a superintending Providence in our favor. To that kind Providence we owe this happy opportunity of consulting in peace on the means of establishing our future national felicity. And have we now forgotten that powerful Friend? or do we imagine we now no longer need his assistance? I have lived, sir, a long time, and the longer I live, the more convinced I grow of this truth—that God governs in the affairs of men. And if a sparrow cannot fall to the ground without His notice, is it probable that an empire can rise without His aid? We have been assured, sir, in the sacred writings that "except the Lord build the house, they labor in vain that build it." I firmly believe this; and also believe that without His concurring aid, we shall succeed in this political building no better than the builders of Babel; we shall be divided by our little partial, local interests; our project will be confounded, and we ourselves shall become a reproach and a byword down to future ages. An what is worse, mankind may hereafter, from this unfortunate instance, despair of establishing government by human wisdom, and leave it to chance war and conquest.

I therefore beg leave to move—

That henceforth, prayers, imploring the assistance of Heaven, and its blessings on our deliberations, be held in this assembly every morning before we proceed to business, and that one or more of the clergy of this city be requested to officiate that service.

WINSHIP'S BRIGITON NURSERY, AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaraceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs. WINSHIP, Bridgton, Mass. will be promptly executed and forwarded to any part of this or other countries.

April 10.

ROBAN POTATOES,

For sale at the New England Agricultural Warehouse a Seed Store, No. 52 North Market Street, at 85 per barrel. October 16. JOSEPH BRECK & CO.

Fruit and Ornamental Trees, Flowering Shrub Plants, &c.

The present being the most favorable season for transplanting all hardy trees and shrubs, we would remind the who are in want of Fruit or Ornamental Trees, Shrub Herbaraceous Plants, &c. that we can furnish them at sh notice at nursery prices, well packed for transportation any part of the country. JOSEPH BRECK & CO. October 15.

MORUS MULTICAULIS.

6000 Mulberries from 2 to 4 feet high, wood well ripened now standing in the field on the Jones. Place in Angell Street half a mile from the Providence Market, for sale low (if taken in the field) by JOSEPH STEPHENSON on the premises or on application to STIMSON & HODGES Providence, October 23.

DOMESTICATED WILD GESE.

A few pair for sale. Enquire at this office. November 6.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at 33 per ann payable at the end of the year—but those who pay will six days from the time of subscribing are entitled to a deduction of 50 cents.

WORCESTER AGRICULTURAL SOCIETY.

Committee on Fat Cattle and Milch Cows.

John L. Boylston, Princeton, Chairman; Joseph Estabrook, Royalston; Daniel Tenney, Sutton; Joseph Sawyer, Bolton; Salem Towne, Charlton; Josiah Gleason, New Braintree; Larkin Amundson, Southbridge.

The Committee on Fat Cattle and Milch Cows respectfully report:

If the main station of wealth and prosperity is ever gratifying, it is peculiarly so when witnessed on an occasion like the present. It brings with it a heart burnings to contemplate the possession of that forms the elements of the husbandman's wealth, for its very possession contributes to the general comfort and independence of the whole community. His granaries may run over with fulness; his stalls may be crowded with their tenants, and his fields may teem with nature's richest products; and yet there is such a consciousness that these are the rewards of industry, that the heart must be cold indeed which does not rejoice in such manifestations of thrift.

Here is no hoarding—here is no evidence of every premium wrung from the distresses of the unfortunate. Here may be thirty, or even sixty old return for the seed cast into the earth; but it is the usury, only, which nature and a beneficent providence pay to him who lets the changing season be his broker, and looks not to Wall street to now the value of his stock.

It has been the privilege of your committee to examine and enjoy the exhibition of a portion only of those specimens of agricultural wealth which have been this day collected here. But they do not derogate from the importance of any other part of the exhibition, when they claim for it a high rank. Our county may not vie with the fertile valleys of the west in the production of grain crops; but we need not fear competition with any part of our country in the character of the herds that graze upon the herbage of our pastures. Our dairies, too, all of the qualities of the animals that supply them, at the same time that they bear witness to the neat housewifery and domestic thrift that makes our farmers not only independent citizens abroad, but happy husbandmen at home. In the general feeling of congratulation at the truly magnificent exhibition of the day, your committee would gladly avoid theviduousness of distinction where all are so worthy of commendation. But their duty requires it, and they proceed, therefore, to particularize the animals which they have examined.

And with great propriety, the first ox which they name is Columbus—not the Genoese navigator, but the admiral of the Princeton herds. Unfortunately for his owner, in the way of premiums, this was not his first voyage to this port—but, fortunately for the society, Col. Whitney had too much public spirit to hesitate, on that account, from offering

him for exhibition. Though Columbus could not, therefore, claim much on the score of being a discoverer; he was certainly as *great* in his line, as ever his Genoese namesake was of old.

Next in the order of pens, was an ox of Lewis and Ebenezer Barnard, of Worcester. Although it is not by any means old for the Messrs Barnard to have fat oxen, or to offer them to grace our exhibitions, they certainly brought an odd one into the pens, and as he weighed 2252 lbs. at the age of 7 years, your committee thought it would not be easy to match him, and have awarded to him the society's first premium of \$20. The ox was wholly fattened upon grass, and had been worked until March last.

Jedediah Estabrook, of Rutland, offered a pair of oxen, weighing together 3880 lbs., to one of which, being his yellow ox, the committee have awarded the second premium of \$15. The age of this ox was 6 years, and his weight 1960 lbs. He has been fattened upon grass, except two bushels of corn and ten bushels of potatoes, and has not been worked during the last season.

Gardner Wilson, of Leicester, offered a pair of oxen, weighing 2280 lbs., which were so near equal that although the committee were satisfied that the third premium should fall to one of them, it was not a little difficult to distinguish to which it should be assigned. The committee, however, awarded the third premium of \$10 to Mr Wilson, for his red ox, weighing 2130 lbs.

The animal was wholly fattened on grass, and is five years old, and was constantly worked until the last spring.

James Adams, of Rutland, offered a fat ox weighing 2115 lbs. He was a beautiful animal, but as he was not raised in the county, he was not entitled to the privileges of citizenship and, of course, could not be voted for by your committee. He did great credit to Vermont, the land of his birth, and showed that 'out west' is not the only place to look for fat things.

Mr Holloway Bailey, of Northboro', offered a pair of oxen, six years old, weighing 3905 lbs., which were of an excellent quality. They were fattened entirely upon grass, and have been worked during the last hay season. They deserved and received the especial notice and commendation of the committee, as well as of others who examined them.

Mr John Rich, of Sutton, offered a pair of oxen, twelve years old, weighing 3788 lbs., and if the committee could state the amount of work done by these oxen before being placed at grass for fattening, and the high condition in which they now are, they would but add new testimony of the value to the farmers of such stock as has been this day exhibited.

The Messrs Barnards did not seem content with exhibiting the best ox on this occasion; but, as if determined to embarrass the committee by offering others of excellent quality, presented a pair of oxen for premium, weighing 3914 lbs., 8 years old, which were worked until last March, and were wholly fattened on grass; but as all the good cattle could

not have premiums, the committee are obliged to pass to the oxen of Francis Davis, of Holden. The pair offered by him weighed 3127 lbs. at the age of 5 years, and were worked until June last, and have been fattened on grass until within ten days past. They were a handsome pair, and, in any ordinary exhibition, might have deserved something more than high commendation.

The committee are unanimous in their recommendations, that the usual fees for travel should be allowed for the several fat cattle exhibited this day, as they all come fairly within the qualities required by the society to entitle their owners to such allowance.

There were five cows offered for premium.

Jacob Stevens, of Charlton, offered a cow, which has been kept with five others, with no extra feed beyond what the pasture supplied. The quantity of milk which she yielded in ten days in June, was 120 quarts, and in September 150 quarts, from which was made 17 lbs. 11 oz. of butter in the ten days in June, and for the same space of time in September, 14 1/2 lbs. of butter; and for this cow the committee award to Mr Stevens the first premium of \$15.

The second premium your committee have awarded to Elijah Darling, of Princeton, for a cow kept by herself, and fed upon ordinary keeping; she was a fine animal, and it was stated to the committee that she produced 221 1/2 lbs. of butter during the past summer, which, with the quantity of milk used in his family, furnished by the same cow, proves her to have been a remarkable animal.

The third premium was assigned by your committee to Reuben Barton, of Millbury, for his cow, eight years old, which produced 13 1/2 lbs. of butter in one week in June, and 8 lbs. of butter during the first week in September; making the quantity of 130 lbs. during the season, besides furnishing milk for the consumption of the owner's family—and, also, for sale, to the amount of eight dollars.

The fourth premium was awarded to William Eames, of Worcester, for his four years old cow.

There was a cow exhibited by Noah Allen, of Shrewsbury, that was of a very high quality in all respects; but as no more than four premiums could be awarded, the committee must content themselves with thus noticing this fine animal.

Fourteen cows were offered for exhibition.

Jacob W. Watson, of Princeton, placed in the pens a valuable cow, with her calf eight days old by her side, which the committee examined with much pleasure.

Wm. Eames, of Worcester, exhibited a cow of the Ayrshire breed, six years old, which, though a foreigner, showed real yankee thrift.

Thomas W. Ward, of Shrewsbury, exhibited two milch cows of an excellent quality.

And Orsenus Willard, of Harvard, also exhibited an imported cow of a fine quality. Although she bears the name of "Lady Blue," the committee were better pleased with her domestic qualities than her learning, if her name was derived from that quality which stamps the sex with the epithet which she wears.

Amory Holman, of Polton, presented our cow, with a calf by her side, which attracted particular notice. She was of half Durham blood, and a very fine animal.

Ephraim Mower, of Worcester, with beaming spirit, placed a fine cow in the pens, which sustained the character of the stock of Worcester county.

The State Lunatic Hospital offered eight cows for exhibition, all of which seemed to partake so much of the character of comfort, good feeding and progressive improvement, which distinguish every thing connected with that institution, that they were a source of general satisfaction in their exhibition.

All which is most respectfully submitted.

JOHN L. BOYLESPOX, *Chairman.*

PLYMOUTH CATTLE SHOW.

Report on Improvements.

The welfare of the whole community is very intimately connected with continued improvements in the art of agriculture. Increasing products of the soil are necessary to supply a growing population with food and raiment, necessary to furnish the means of prosecuting other arts in society, both useful and ornamental; and, as the principal source of the capital which moves the commerce of a country, the branch of business which presents so many attractions to young minds. The motives of interest to engagement in this work seem very numerous and strong, yet enlightened and serious minds can discover higher inducements than any of mere temporal interest. In the labors and experiments of the field we become co-operators with the great Author of all things; there we are continually incited to considerations of his doings and purposes; there we are abundantly blessed with the means of that acquaintance with our God which will give peace and all the good an immortal mind can desire. Notwithstanding all the inducements presented to labor in the field, it is often true that other branches of business obtain a very injurious ascendancy. Numbers of our citizens, like some of the Israelitish worshippers, want a mass of gold immediately before them to stimulate their exertions; a promised land at some distance, though the assurances be repeated and strong, that it shall "flow with milk and honey," does not prove sufficient encouragement to persevering and laborious pursuits. Great haste is made to be rich. This circumstance has heretofore diverted the attention of many from some of the most important objects presented on your lists of premiums. Calculations seem to have been made whether the amount of the offer would prove any thing like a compensation for the labor and expense attending the proposed experiment. We hope more just and extensive views are now cherished—that competitors are generally seeking and will receive better reward than our hands can give.

We have witnessed with pleasure an increased attention to the renovation of swampy lands.—Some of the choicest treasures of this county have long remained useless and dormant in those situations. We rejoice to see the rigid bands broken and banks of discount opening there. Claims to the premiums made payable in 1840, have been entered by four persons, who in the accomplishment of their respective objects, will add a good number of acres to the productive fields in the county.

Three claims have been entered to the premiums offered to encourage the cultivation of nurseries of Chinese mulberry trees. Be not alarmed, sir, there is no burriness underneath to force the growth, nor any reckless speculator at your side, who would ride your pockets by the influence of false representations, who would tell you that every blade in these nurseries is of equal value with a five-dollar bill, that the leaves of the tree are leading to every disease which afflicts the body, that they are convertible into pleasant cheering beverage and nourishing food, and that what may not be required for those important purposes can be manufactured into fine paper on which you may write briefs.

The cultivators of mulberry trees in this county, have not been rash adventurers, and, therefore, will experience less temptation to resort to falsehood and imposition. Some of them feed worms proportionate to the increase of their trees. Thus we think the proper course, especially when the *Morus Multicaulis* are cultivated, for it is very doubtful whether these trees will ever be so acclimated here as to endure our winters.

We recommend the award of the first premium of \$8, to Mr Lincoln Jacob, of Hingham, who has cultivated a nursery of 2100 trees. The second of \$4 to Mr Franklin Amos, of West Bridgewater, who has 2150 trees, 1771 more than reported last year. We also recommend that 2 vols. of N. E. Farmer be given Mr Amos; and 2 vols. Yankee Farmer to Mr Benjamin P. Pratt, of Middleboro', who has a nursery of 1700 trees.

Richard Stone, of West Bridgewater, is entitled to \$9, having built the last season more than one hundred rods of stone wall. The same sum is also awarded to Austin Keith, of West Bridgewater, Nahum M. Tribou, John Wood and Isaac Pratt, of Middleboro'.

The committee in viewing stone wall, regard chiefly the sufficiency of it to protect fields against the inroads of cattle; but think the builders would do wisely in giving some attention to appearances, especially on public roads. The traveller will naturally conclude that fields enclosed with misshapen and loose walls are no more than imperfectly cultivated. Two ranges of wall built by Messrs Keith and Pratt, were distinguished for neatness in appearance, and we recommend that 2 vols. of N. E. Farmer be given to each of these persons.

In a country where there has been something of tillage more than two centuries, the farmer's success will depend very much on his attention to the operations of nature and his diligence in the collection and application of those vegetable substances and alluvial soils, which time is continually depositing in hollows, on the margin of forests, by the road side, and wherever the course of the wind meets an obstruction. To encourage labors of this kind, the premiums which we have now to award were framed. The alteration from our former offers was not well understood by some of the competitors. In consequence of their misunderstanding, possibly, the committee have been led into some errors. The arrangements in future years will be better understood. We think the alteration important and useful; we cannot think otherwise, if we suppose there is any semblance of truth in what one of our orators said on a former occasion, that "in this county it is no uncommon thing for one town to blow into another."

The first premium for the collection of materials

to enrich fields, \$20, we award to Galen Howard, of W. Bridgewater, who has collected 526 loads. The second of \$15 to Horace Collamore, of Pembroke, who has collected 344 loads. The third of \$12 to Alfred Wintman, of E. Bridgewater, 330 loads. The fourth of \$10 to Paul Hatlaway, of Middleborough, and 2 vols. N. E. Farmer.

The statement of Mr Collamore was distinguished for particularity, and we believe for general correctness; we recommend that 2 vols. of Yankee Farmer be given him.

As this is a visiting committee, we may be justified in taxing your patience with a few excursive remarks. Every passing season presents to the farmer numerous lessons which should be studied and applied. In a strong wind which passed over the county in the month of August, and prostrated so much of the corn, we were forcibly admonished of the importance of providing some protection for the fields by planting trees on the borders. One field was passed after the gale, where the road was bordered with trees on the north, and the corn in that field was standing almost perfectly erect. We could not suppress a caution of regret, that the efforts heretofore made by this society to induce the inhabitants of the county to plant trees on the road side, had not received more attention. On the sea coast, raking winds are of more frequent occurrence than in the interior country; the injurious effects of them on plants and in the impoverishment of the soil will be far greater where neither trees nor stone walls are standing as breakers. We have been sorry to observe in many instances the remains of former wrong habits in tillage, in the erection of little mounds of earth round corn, potatoes, or other vegetable plants. Ridge culture belongs not to New England, except when swamps are cultivated. In this climate there is seldom any redundancy of moisture, but often deficiency; therefore our cultivation should be directed with a view to the greatest retention in the soil of dews and rains.

In our circuits in the county, we have remarked a very prevalent neglect of fields in the last of the season. The strength of the soil in many places, is more clearly exhibited in a rank growth of weeds than in useful plants. Weeds have the same furfolding aspect to the farmer that vices have to the moralist. But the *appearance* is the least evil in the case; there is exhaustion of the soil and an abundant supply of seed to produce a future harvest of bitterness. We regard it important to direct attention to this subject, and encourage farmers to keep their fields clear of weeds as possible, through the whole season; still we are conscious this is one of the subjects on which preaching is easier than practice, and are willing to receive the application of the proverb in the full force that the appearances of our fields will justify, "a physician heal thyself."

Inventions.

The committee award to Pebes Crane & Co. of
West Bridgewater, for an improvement on cook-
ing stoves, \$5 and 1 vol. of N. E. Farmer.
To John A. Conant, 2d, of East Bridgewater, for an
improved leather roller, \$4 and 1 vol. of N.
E. Farmer
To George W. Pratt, of Bridgewater, for a new
constructed straw gauge, \$1.
To Jonathan Whipple, of Grafton, leather cutter \$2.
To Sprout & Andrews, for a board saw receiver \$3.
To Seth Pratt, Jr., of Bridgewater, for a bugle \$2.
Most of the articles are in a highly finished state
and give evidence of increased improvement in the
mechanic arts. The bugle by Mr Pratt we con-
sider, though we are no musicians, to be particu-
larly an article of superior workmanship.
All of which is submitted.
SOLOMON HAYWARD, Chairman.

Stock.

The Committee take pleasure in saying, that on
no former occasion have they witnessed better spec-
imens of stock than has been exhibited this day
for premiums. The pens have been well filled
with prime fat oxen, excellent milk cows and beau-
tiful young stock. The committee regret that they
have not more premiums to award, finding so many
competitors whose merits and claims are so nearly
equal—but being under the necessity of cutting
our garments according to our cloth, we have cut
and distributed as follows:
1st premium of \$6, to the Hon. Daniel Webster,
for the best fat ox.
2d do \$5, to do, for the next best do, from his farm
in Marshfield.
3d do \$1, to Samuel F. Sanger, of Bridgewater, for
the next best.
4th do \$8, to Jarvis Burrell, for the best milk
cow.
5th do \$5, to Sidney Packard, E. Bridgewater, for
the next best.
6th do \$4, to George Bates, of Bridgewater, for the
best heifer.
7th do \$2, to James Stetson, of W. Bridgewater,
for the next best.
8th do \$8, to Martin Swift, Bridgewater, for the
best bull.
9th do \$6, to Reuben Thompson, of Plympton, for
the next best do.
10th do \$4, to Calvin Williams, for the best bull
calf.
11th do \$3, to Zephaniah Keith, of Bridgewater,
for the next best do.
12th do \$3, to Col. A. Washburn, for the best heif-
er calf.
13th do \$2, to Seth Pratt, for the next best do.
They recommend the following gratuities to un-
successful claimants:
1 vol. N. E. Farmer to Capt. S. Howard, W. Br'tr.
1 " " to Isaac Howard, do
1 " " to Galen Wilbur, Bridgewater.
1 " " to Ephraim Snell, West do.

1 vol. Yankee Farmer to Jacob Robinson, Bridg'tr.
1 " " to Jacob Carver, do
1 " " to William Gardner, do
1 " " to Mrs Betsey Gilbert, do
All which is respectfully submitted.

A. W. OLDHAM, } Committee
SALMON HOWARD, } on
JOHN TILDEN, } Stock.

Ploughing.

The committee had eight teams entered for
ploughing. Seven appeared at the appointed time
and performed their work very much to the satis-
faction of your committee. After much delibera-
tion, your committee have agreed on the following
awards:
They award the 1st premium of \$8 to Abraham
Washburn, 2d. Work performed in 22 minutes.
The 2d do of \$6, to the town of Bridgewater, Silas
Robbins, Superintendent of the Almshouse,
ploughman. Work performed in 19 1/2 minutes.
The 3d do of \$4, to Willard Wood. Work per-
formed in 22 minutes.
The 4th do of \$2, to Adin Alger. Work perform-
ed in 15 minutes.
They also award to Cornelius Holmes one volume
of the New England Farmer. Work performed
in 20 minutes.
To Newton Mitchell one volume of the Yankee
Farmer. Work performed in 21 minutes.
To Philander Wood, one volume of the Yankee
Farmer. Work performed in 24 minutes.
The ploughs used were all of cast iron, and of
very good quality. The committee were of opin-
ion that the one manufactured by Prouty & Mears,
called the Centre Draft Plough, was preferable to
any other. All of which is respectfully submitted.
ABRAM WASHBURN, 2d, Chairman.

Cocoons and Silk.

The greatest quantity was presented by Mary
Eliza G. Niles, for which your committee award a
premium of \$4.
The next greatest quantity was presented by
Hannah Sparrow, of Middleboro', for which we
award a premium of \$2.
Hannah Sparrow also presented 2 oz. of wrought
silk, for which a premium of 20 cents is awarded.
Sally Pratt, of Middleboro', also presented a spec-
imen of about 5 oz. of wrought silk, for which we
award the sum of 50 cents.
Mrs Franklin Ames, of West Bridgewater, also
presented a small specimen of wrought silk, for
which we award 20 cents.
All of which is respectfully submitted.
JARED WHITMAN, Chairman.

Articles of the Dairy.

The number of competitors on butter and cheese
was about the same as on former occasions, and
the quality would not suffer in comparison with any
heretofore offered. In fact, they have seldom met
with so many excellent samples of the kind. It
was with some difficulty that they could come to
the nice distinction, in some instances, between
the 1st and 2d premiums, and in this they may have
erred. But the excellent quality of the articles ex-
hibited, serves to show that with skill and perse-
verance, as good butter and cheese can be made in
the Old Colony as in any other section of the coun-
try. It gives the committee pleasure to commend

the handwork of our fair dairywomen to the lovers of good living and to the community generally.

Butter.

They have awarded the 1st premium to Mrs Geo. W. Bates, of Bridgewater, \$4.
2d do to Mrs Rosanna T. Pokes, of do., \$2.
3d do to Dyer Robinson, of do., \$1.
To Mrs Hannah Crooker, of do. 1 volume N. E. Farmer.
To Mrs Lydia Dean, of Middleboro', 1 vol. Yankee Farmer.

Cheese.

1st premium to George Thompson, of Middleboro', \$5.
2d do to Mrs Bethiah Bates, of Bridgewater, \$3.
2d do to Ezra Phillips, of Hanson, \$2.
To Mrs Lydia Thompson, of Middleboro', 1 vol. N. E. Farmer.
To Dexter Pratt, of East Bridgewater, 1 vol. Yankee Farmer.

Although the majority of your committee have passed the meridian and are in the downhill of life, and have no occasion themselves to speculate in fancy stocks, yet they would recommend to the young men just coming upon the stage of action, who are employed in the useful and honorable occupation of tilling the earth, to keep a good look out for the best dairies, and to secure for their companions, graduates from those most useful seminaries.

For the Committee,

HOLMES SPRAGUE, *Chairman.*

BERKSHIRE PIGS.

To the Editor of the Cultivator:

SIR—I see a statement made in a late number of the New England Farmer, by Caleb N. Bement, of Albany, in which he denies having ever sold any Berkshire pigs to me or to any other person in Framingham.

My advertisement in your paper of June last, runs thus—

"W. S. Turner has just received 14 pigs from Albany, male and female, of the Berkshire breed. These pigs were procured of Bement & Glauson."

Now Mr B. denies that he sold them to me or to any person in Framingham. Who says he did? My statement was that these pigs were procured of Bement & Glauson. Were they not? Mr B. does not say they were not. But to prove that they were procured of them, I send you my voucher, which is a bill of sale signed by Thomas Reed, Jr. and is in the following words—

"Framingham, June 13, 1839. I hereby certify that I have this day sold Mr Wm. S. Turner 14 full blooded Berkshire pigs, which I had of Messrs Bement & Glauson, of Albany, N. Y., and from their recommendations. THOMAS REED, JR."

Mr Reed is of East Kingston.

W. M. S. TURNER.

Framingham, Oct. 20.

Butter.—Perhaps there is no article of general use produced by farmers, of which the quality, as a whole, is so inferior as that of butter. The grand fault is, not freeing it from the buttermilk. Unless this is done, sweetness is impossible. Butter freed from all extraneous matters, is as little liable to spoil or grow rancid as lard or tallow; but buttermilk soon becomes intolerably offensive, and when left in the butter renders it most unpalatable. Dairy-women, remember this.—*Genesee Far.*

For the New England Farmer.

MR BAKER.—The following detached thoughts, written rather for amusement than for the edification of you or your readers, may serve to fill out space in your columns for which you lack more valuable matter.

THE FARMER'S HAPPY LOT.

The condition of the thrifty husbandman of this country, is a condition conferring more of the real blessings of life than any other human lot—it is conducive to the greatest health—to the strictest independence, and to the purest happiness; especially with him who can appreciate the beautiful nature—who can learn lessons of virtue from the humblest plant of his fields, and take in the measure the hand of an Almighty Power. Such are never than other men allied to God:

"The man
Whom nature's souls can charm, with God himself
Holds converse; and grow faster day by day
With his conceptions—act upon his plans,
And form to his the wish of their souls."

If there is one thing more peculiarly calculated than another to impress the farmer with a sense of the independence and happiness which it is his high privilege to enjoy as a cultivator of the earth, it is such times of depression in the business world as the present—when the merchant, the mechanic and the manufacturer, deprived of the facilities upon which, principally, they rely for the successful prosecution of their business, are subjected to sufferings and expedites to which the husbandman is a stranger. With him, the refusal of banks to discount, the fluctuations in stocks and exchanges, and the numerous vicissitudes in business affairs which so disastrously affect other men of other professions, need cause no concern. The facilities he requires for prosperity in his pursuit, are supplied chiefly by Him who has promised 'seed time and harvest,' and whose promise is good. Calm in the consciousness of his independence of human aid, with his granaries filled to overflowing and every thing around him conspiring to his comfort, how signally blessed is the farmer over other men in 'hard times' like the present, which drive hundreds to bankruptcy and ruin and bring distress upon thousands. The earth is the bank he deals with, and, favored by Heaven, she never refuses to the hand of industry whatever in reason it solicits. Happy, thrice happy man, in being so independent of his kind, and so dependent upon God.

Could the farmer who murmurs at his lot and is anxious to enter on some more money-making pursuit, but he made acquainted with the suffering experienced by business men in a crisis like the present, his murmurs would soon cease, and he would readily perceive that in 'striving to better' he would 'mar what's well.'

Speaking of farmers murmuring at their condition, it has ever been a matter of surprise to me that discontent should ever enter the breast of an industrious husbandman, because it is difficult to reconcile it with common wisdom and common sagacity. Does it not arise from the lack of a due observation of men and things? which deficiency is to be ascribed to the secluded situation of the yeomanry, insulated as they are from the busy world and deprived of those sources of instruction so easily accessible to those of large communities.

This discontented spirit operates disadvantageously to agricultural improvement, and it is therefore desirable that it should be extirpated from the

breasts of the cultivators. How may this be effected? How may the husbandman be supplied with that information which will enable them to perceive wherein as cultivators of the earth they are 'better off' than other men of other professions—wherein they are more happy—wherein they are more independent—wherein they are more secure in their property? We answer, through agricultural publications as one and the chief means, and through conventions of farmers at cattle shows and on other occasions, in addresses and conversation, as another means.

In a former communication I spoke of the great efficacy of agricultural papers in benefiting the cultivator in his profession and of exalting that profession in the public estimation; and so deeply am I impressed with their importance as a means to promote this end, that I would again allude to them.

The season is at hand when the farmer has much time to devote to reading; and it would seem that agricultural papers contain the very kind of reading which should engross the chief part of his attention. It is needless to advise those who are subscribers on this point: it is those who are not subscribers, and who (it is a much to be regretted fact) compose by far the greater part of the yeomanry—it is this class of farmers that we would have read these papers and profit from their perusal. We can conceive of a plan to effect this great object to some extent if not generally. Let some noble souls in each village form themselves into a reading club and subscribe for the agricultural journals of the middle and eastern States for a term of six months in each year;—let these papers be kept at the dwelling house of one of the club or other convenient place—then invite, may I urge, the non reading portion of their brother farmers to meet and peruse them whenever they saw fit, and contribute their mite towards defraying the expenses attending the commendable enterprise; might not some permanent good arise from this step? might not the farmers who do not now take a paper devoted to their interests, be induced thereby to become subscribers, and, as a consequent, better farmers and more valuable neighbors? We are disposed to think much of good would result from this project; it commands itself to every one—and let him who has a disposition to benefit his kind, move in this matter—yes, let one move, and a nucleus will be formed around which sufficient soul will gather to accomplish the object.

You will remember, Mr Creck, that in reply to the suggestion of a correspondent published some months since, you informed him you were willing to receive in pay for the Farmer, from those who would like to become subscribers but who thought they could not pay money, most any articles of farm produce. I introduce your offer here for the purpose of asking a small favor of your subscribers, which is, that each will inform his neighbors who are not subscribers, of the accommodating terms on which you offer the Farmer, and represent to them the advantages to be derived from its perusal. Are there not some who will act upon this request? I trust there are many, and that you, sir, will have proof of it in accessions to your subscription list;—not that my aim is to benefit you solely or particularly—no, it is the yeomanry I would particularly benefit; benefit by persuading them of the importance of their profession, and teaching them so to pursue it as to render it a source of greater contentment and greater wealth;—benefit by diffusing among them the light respecting their art which it

s been reserved for modern times to develop;—nefit by inducing them to renounce hereditary por and adopt for their guide the teachings of science and enlightened mind. All these benefits will erue from the constant reading of well conducted ricultural papers, and in some degree, from conations and addresses, and from the labors of learnmen employed by government in making agricultural surveys and scientific researches, for the pical good of the husbandman and the commonod of all. Let the great mass of the husbandman but become addicted to reading the papers voted to their interests, and all ground for murmuring at their lot will vanish, and new inducements will arise for sticking closer to their honorable employment.

One of the most powerful means operating to reduce this end was the pen of a BRILL. Oh, that sath had spared him longer—spared him as a benefactor of his kind—spared him as an example for us to imitate. But though removed from the me of his usefulness here, his works will not on follow him, but will tend in time to come as time past, to promote the great object for which so zealously labored, the improvement of American agriculture. The vocation have lost in him powerful friend and instructor—but they have a COLMAN spared, and others too, gifted in

The godlike grace of intellect, the giant might of mind,

to teach, to expound and to defend.

Boston, Nov. 1, 1839.

J. H. D.

For the New England Farmer.

MR BRECK.—In Mr Kenrick's very valuable work, "New American Orchardist, under the article site Antwerp Raspberry, he says, "Like the red requires protection in winter." Permit me to enquire, if experiment has shown this to be universal-necessary in the vicinity of Boston; or is the necessity of protection limited to certain exposed situations?

I have for many years successfully cultivated a variety of Raspberry, and have never protected plants during the winter. I prune them in the autumn and leave the young shoots standing between two narrow rails on each side. The last autumn I made a new plantation of about 500 roots the month of October. The ground was nearlyaked most of the winter, and at no time covered with more than a few inches of snow. Every plant died, and there was a good crop of fruit the past summer. Yours, respectfully,

P. CLEVELAND.

Brunswick, Me., Oct. 28, 1839.

[Remarks.—Raspberries that are protected prove more abundantly than those which are not.—We believe it is the general custom to protect them about Boston. Some cultivators take them up and lay them in, and plant them out again in the spring.—J. B.]

Important to Farmers.—A former of Long Island writes that the half-breed Durham cattle are better suited to bear the extremes of heat and cold which they will be exposed to in this climate, than the pure Durham, as their skins are thicker and their coats closer and longer than the pure breed. The milking qualities of the heifers bred in this way are almost beyond belief, some of them milking forty, and even fifty quarts a day of rich fine milk.—*Boston Trav.*

From the New York Observer.

DR. HUMPHREY'S THOUGHTS ON EDUCATION.

Common Schools.

If being a given point that the blessings of education ought to be universally diffused—that every child in the State, however poor, should be taught to read and write and keep accounts, the great practical question is, how this end can best be accomplished. In Scotland this has been done ever since the Reformation, by the parish school-master; and in New England, from its first settlement, by the aid of common schools. Whether this is the best system of popular education which can be devised, is a fair matter of inquiry. If there is a better, it ought to be suggested, matured and adopted; for what we want, is a system which will insure the elementary education of the whole mass of the people, and bring it at the least expense, within the reach of every family.

As the common district school system of New England has worked so well for more than two centuries, and no essential change, that I am aware of, has ever been proposed, I shall take it for granted, that in all its essential features, it is better adapted than any other to the condition of our people, and the genius of our free institutions. Its great advantages are, that it is strictly republican in principle and in operation; that it plants down its school-houses within convenient distances, all over the face of the land; that it brings the children of all classes together upon one common level; and that it provides instruction for those who are in the most indigent circumstances, as well as for their rich and thriving neighbors. It is not to be supposed, however, that our primary school system is so perfect in its essential principles as to admit of no modifications or improvements; and still less, that the greatest possible efficiency has been imparted to it anywhere. Like other great machines, it must be moved by some adequate power. There must be a general co-operation of the people with the government, to keep it in motion.

In order to reap the highest advantages from our admirable system, there must be a sufficient number of school-houses, pleasantly and healthfully located—well built, warmed and ventilated—admitting enough, but not too much light; and comfortably fitted up with seats, writing desks, and such other conveniences as will rather attract than repel both teachers and scholars.

There must be competent and faithful instructors—male and female—apt to teach, fond of the employment, skilled in government, patient, conscientious and laborious; instructors who will be always at their posts, working month in and month out, for the pleasure of it, as well as for the wages, and delighting in nothing so much, as the intellectual and moral improvement of their pupils.

The children, likewise, must be sent steadily to school—must be furnished with suitable reading and spelling books; with slates, pencils, writing apparatus, maps, geography, arithmetics, dictionaries, and whatever else is necessary to aid and encourage them in their studies.

To pay the teachers and defray other necessary expenses, moneys must be raised either upon the scholar, or by assessments upon the property of the town or district, or from such permanent funds as may be provided by individual liberality or legislative appropriations.

School committees, selected from the most intelligent and best educated class of men in the respective school societies and districts, must be appointed to hire and examine teachers; to select and recommend books; to visit the schools, and to aid the instructors with their best influence and advice.

And finally, the great mass of the people must move together, or the end will never be accomplished. Parents of all classes must be warmly enlisted in the improvement of their children and the prosperity of the schools. Without their hearty co-operation, whatever else you may do, the primary schools will languish and ultimately run down. The families of a village or neighborhood are not mere inert masses of matter, to be moulded and fashioned according to your pleasure, like so many potters' vessels; but living, thinking beings, to be swayed by motives, and to co-operate with you in your efforts to do them good.

This is a hasty outline of what I take to be essential to the highest prosperity of our common schools. But the great importance of the subject seems to require considerable enlargement, for which I must crave the reader's indulgence.

(To be continued.)

BENEFITS OF NEWSPAPERS.

The existence of newspapers is one of the most remarkable features of the difference between ancient and modern times. These sheets of intelligence now form an element in the condition of nations, which the ancients scarcely possessed in embryo. They render the official duties of statesmen much more difficult than they formerly were, but they also render the condition of nations much more safe and secure; for no measure can become a law without the merits and demerits of it being fully discussed by the press and understood by the people. For the want of these useful monitors, the ancients were like people wandering in the dark; timid because of their ignorance, and apt to be overcast by the slightest alarm. But by the aid of newspapers, we are enabled to know exactly the state of affairs in every part of our own country, and all over the whole world as well, and to be prepared in some measure for any coming event whatever. Newspapers are the brief chronicles of the times, and have a wonderful influence in guiding and directing the public mind on all public questions.—*V. Y. Sun.*

An orange tree frequently yields fifteen hundred to two thousand four hundred oranges. An elm living one hundred years, produces not less than thirty-three millions of grains; and a purple digitalis one million seven thousand seeds. Some plants are so prolific, that one flower producing forty four seeds, would, if left to itself, in a short space of time, spread from one end of the globe to another.

Progression.—We learn to climb by keeping our eyes on the mountains that rise before us, and not on the hills that lie behind.

Washington fought for his country—Bonaparte for fame. The lips of a mighty nation speak the praises of one—the ocean waves chaunt the requiem of the other.

Quince Wine.—A delicious wine is made of this fruit in the following manner: Take one quart of the juice of quinces mixed with one pound of sugar, and ferment.

NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, NOVEMBER 20, 1839.

OBITUARY.

Died at Pittsfield, Mass., on the 8th inst., **THEODORE SEDGWICK**, Esq., of Stockbridge, Mass.

It is our painful duty to record the death of this estimable and excellent man, and it is a debt due as much to public morals as to private virtue, to hold up this bright example of integrity, honor, truth and patriotism, to the encouragement and emulation of the friends of virtue, wherever he has been known.

If it should be asked what claims have his life and character to notice in such a publication as ours, we answer that Mr Sedgwick was eminently the friend of the laboring man, the admirer of rural and agricultural life, and the most ardent advocate for the education and improvement of the industrious classes of society; and for every public enterprise and work which had in view particularly their elevation and comfort. It is delightful, and amidst the selfishness and meanneess which everywhere pervade society, it is a precious consolation to be able to recall the memory of so excellent a man.

Mr Sedgwick was endowed by nature with superior talents, and these were cultivated and improved by a ample advantages of education and a wide and familiar intercourse with society in all its various departments. His perceptions were extremely rapid; and he arrived at his conclusions with a quickness and certainty, which are rarely seen, even among the highly cultivated, and which always evince a comprehensive and powerful intellect. He was a man of much originality of mind and distinguished by an extraordinary energy of thought and feeling. If his opinions and conclusions were not always deemed sound and true, (and where on earth are perfect consistency and wisdom to be found?) yet no one, much as they might in any case differ from his own, could for a moment doubt that they were the honest convictions of a perfectly true and incorruptible mind; a mind incapable of being biased in its decisions by any little, low, or mean purposes or interests. He was indeed a true man; and in that purity and elevation of character which rendered him as utterly incapable of a mean purpose or thought as of a mean action, he might justly be pronounced one of the noblest of men.

His conversation was full of instruction and information; his manners kind and courteous, and in every condition of life in which he was placed or was called to act, he displayed an exemplariness of good conduct, which conciliated universal affection and regard. His manners were unostentatious, and of a transparent simplicity and frankness. In the private and domestic relations of life no one was ever more beloved; and as a citizen and in the official services of public life, but the rancor of party he as bitter as bitter can be, no one ever distrusted and no one ever presumed to cast a suspicion or reproach upon his sincerity, integrity, honor and disinterestedness.

He was at home at once upon every subject which concerns humanity. A few years since he made a visit to Europe; and his observations on the condition of the poorer classes, show a heart deeply wounded by the injuries and oppressions under which they were often crushed to the earth; and in which a benevolent desire for their relief and amelioration of these evils wherever they might be found, predominated over every other sentiment. Such men as he are rare in the community.

It becomes every poor man and every working man, woman and child in the community, to cherish the

memory and character of such a man, let his religious denomination or his party attachments be what they may, with the strongest affection and respect. We believe that in purity of purpose and kindness of heart, and in perfect honor and uprightness, he has not left his superior behind him.

H. C.

SILK CULTURE.

We have now become entirely satisfied that the production of silk must advance and become a great interest of the country. In this matter we have ceased to trust to hearsay or mere report; but we have come to the knowledge of various experiments made in different places, and made with perfect fairness and the greatest care and exactness, which demonstrate, that even with the high prices of labor current among us, raw silk can be produced at an expense not to exceed two dollars and fifty cents a pound. We shall presently have the pleasure of laying these reports before the agricultural public in such a form that they cannot be distorted or discredited. The silk likewise produced in New England is in point of strength, weight, and lustre not inferior to any grown in any country. We know very well that many persons pronounce it very much superior to that grown in warmer climates; but this may be so or may be otherwise. This opinion may result wholly from the habitual self conceit, which we must confess, is a somewhat strongly-marked feature in the organization of a Yankee. It is enough for us however, to say, that the silk produced among us is as good as any that is to be found any where; and this circumstance is in itself a great encouragement to the cultivation.

We have given the last three weeks almost exclusively to the investigation of this particular subject, and at the fountain head. The inhabitants of Manchester, in Connecticut, have been in the practice of producing silk for nearly seventy years. They have found it a source of considerable profit even on the limited scale upon which it has been pursued among them. The work has been principally performed by females, and it has not unfrequently happened, where a mulberry plantation has been taken as it is termed to the halves, the young woman taking it gets thirty to fifty dollars and her board for her six or eight weeks labor. In this case the owner of the land furnishes eggs, trees, and room to work to, besides boarding the woman while the operation is going on. The woman tends the worms, peels the leaves and reels the silk; the produce is then divided equally.

The tree hitherto used in Mansfield has been the white mulberry. In 1835, two thirds of all the trees in the town were killed by the severity of the cold. They have not as yet been replaced; but they soon will be, either by some of the same kind, or by the imported and improved varieties. In other places experiments have been made with the foreign kinds—the Mulberry, the Canton, and the Alpine; and these experiments have been perfectly successful; the foliage has proved abundant; the silk made from them of fine quality; and the worms have proved healthy under this feed. This is a great result; and puts it in the power of any one so disposed, to ascertain the practicability and the profits of the silk culture. The question is soon settled; and the determination of it requires a small expense of money or time.

The prosecution of the silk culture will prove of immense importance to the country. For half a century to come there can be no danger of its being overdone.—The demand will, as matter of course, increase with the supply. To meet the present wants of the country, is no small matter; and years are likely to elapse before we can reach this point. Why it may not hereafter be

made matter of export from the country, no good reason can be given; at least no better reason than could have been given forty years ago, why cotton should not come an article of export from the country.

We look forward to the production of silk with highest satisfaction and interest, as affording a most valuable resource for aged persons, who, incapable of doing severe toil, have not yet passed the period useful labor; for young persons, whose services can be made useful only in some such light employments and for indigent persons, decayed widows and female who often find it extremely difficult to obtain or in any means of support.

It will have some prejudices to encounter from persons who are habitually distrustful of every new project and the extravagant calculations and most exaggerated estimates of profits to be expected from it, which constantly made and put forth by the ignorant or designing, must operate much to its hindrance and disadvantage. The public mind will presently be disabled in all these matters; and results, resting upon the merits of and decisive experiments, and such an accumulation of settled facts as leaves no room for doubt, will set every thing right. The culture of silk will go and prove a source of profit to industry and good management sufficient to satisfy every reasonable desire to compensate most amply the labor bestowed upon it. We forbear further statements on the subject at this time, as we shall make it matter of full examination and discussion in our next report to the government.—H. C.

BRINGING CATTLE TO THE BARN.

The 20th of November is universally understood throughout New England as the close of the season for pasturing, and the time for bringing our cattle and stock to the barn. Sheep may be left out as long as ground remains bare; but it is believed to be bad management to leave cattle out after severe frosts come; especially in storms of sleet and snow. Fat cattle the fattest districts are tied up to be fed and turned in the yards at night. In this case the yards are well tilled and a dry place is always furnished for the cat to rest upon. For young cattle, well protected yards and open sheds with a southern aspect, are to be preferred to close and warm barns. For milch cows, however, stables which are dry, warm but well ventilated and well littered, and kept thoroughly clean, should be provided, and these animals should never be exposed to cold rains or storms, or winds, which make them shy and become restless; and of course cannot fail to diminish their milk. They should be well fed, and carefully carried, and treated always with gentleness and unvaried kindness. It is impossible to reconcile the careless, slovenly, neglectful, and we may add inhuman manner with which these useful and beneficent animals are commonly treated, with any just regard to the farmer's own interest or even with the principles of common justice.

H. C.

WHEAT—The Cleveland Herald of the 5th states that the receipts of wheat at that port during the preceding month, were 377,115 bushels, and of flour 46,488 barrels; and in the past seven months, 1,350,620 bushels of wheat and 230,550 barrels of flour. The amount of wheat tribes that received two years ago

The Chicago American states that winter wheat of the first quality, is now selling at Chicago at 75 cents. The quantity of wheat coming in from the country exceeds all expectations.

W. B.'s communication on Forest Trees shall appear in our next.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Nov. 16, 1839.

The following specimens of fruits were exhibited to-

Samuel Downer, Esq., Roxbury; Peas—Dulness gentlemen, Mons John, Bleecker's Meadow, Knight's King and Lewis pear; also Golden Russet Apple—the specimens.

Gould, Esq., Brookline, exhibited several species of Peas.

C. Lee, Esq., of Salem, exhibited specimens of names unknown.

Wm. Kenrick, Esq., of Newton, sent the Pounding Apple—a very large and fine specimen.

Wm. Oliver, Esq., presented the new variety of Wintusk Melon. This specimen was not fully ripe, but the committee were led to believe that if this fruit receive more notice and care, it would prove a valuable variety. For the Committee,

JAS. L. L. F. WARREN.

EXHIBITION OF VEGETABLES.

Saturday, Nov. 9, 1839.

Wm. Prince, Esq., exhibited a fine specimen of the *Brussels Sprouts*. This vegetable needs only to be sown and its merits will be fully appreciated.

Two specimens of the Chinese Tree Corn were sent in the garden of Mrs Bigelow, Medford. The specimens were very large and fully ripe.

J. L. L. F. WARREN, Chairman.

BRIGHTON MARKET.—MONDAY, NOV. 18, 1839.

Reported for the New England Farmer.

Market 1020 Beef Cattle, 825 Steers, 5600 Sheep 1530 Hogs. Several thousand sheep unsold.

Cattle.—Sales were quick at an advance on last week's prices. We quote 1st quality, \$7 25. Second quality, \$6 00 a \$6 50. Third, \$4 75 a \$5 50.

Redding Cattle.—Several lots were purchased at 0 for Mess and \$5 00 for No. 1.

Wool.—We continue our last quotations, viz: Yearling, \$10 a \$12. Two Year Old \$15 a \$26.

Wool.—Sales dull and prices reduced. We quote 1st 125, \$1 40, \$1 80, \$1 92, \$2 00, \$2 17, and \$2 35. Prices have further declined and we reduce quotations. Several lots for peddle, two thirds bar-

at 4, 4 1 and 4 1 2, some of which were selected a lot of old barrows at 4, and two lots at 1 1-2. A close at 3 1-2, and a lot at 4. At retail 1 1-2 to 6

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass., in a shaded airy exposure, week ending November 17.

BERKSHIRE HOAR FOR SALE.

fine full blooded Berkshire Boar, six months old, for sale. Price \$30. Apply at this office.

IMPROVED PIGS FOR SALE.

For sale three, improved Boars of the following breeds; one half Berkshire and half Macky. one half Berkshire, quarter Macky and quarter Mocha. one half Berkshire and half a large English breed, name known.

The above boars are two years old; they are disposed of account of keeping young sows of their get for breeders. They will be sold cheap if applied for soon. For terms, &c., apply to J. BRECK & CO. November 13.

SOUTH DOWN RAMS.

one half blood South Down Rams, for sale at a reasonable price. Apply to JOSEPH BRECK & CO. New England Farmer Office. November 6.

SPLENDID BULLOCK'S FLOWER ROOTS.

Just received by JOSEPH BRECK & CO., from Holland, a very large and well selected assortment of Dutch Bullock's Roots, among which are the following:—

HYACINTHS.—Double white, double white with red and purple eyes, double red, double red, dark blue, full blue and yellow, single white, white with red and purple eyes, rose pink, red, light and dark blue, yellow and variegated, comprising 150 varieties of choice named sorts.

TULIPS.—Fine late named sorts, like double do., mixed single, mixed double, single and double Van Thord for foreign, Parrots, &c. &c.

CROWN IMPERIALS.—Double red and yellow, single red and yellow striped leaves, &c.

POLYANTHUSES.—NARCISSUS—White yellow, white with yellow and citron cups, and citron with yellow cups.

NARCISSUS.—Orange Phoenix Sulphur Phoenix, Incomparable, Van Sion, and Tratis cantus, with double flowers; Trumpet major, Sulphur and Postions, with single.

JOSQUETTES.—Double and single.

IRIS.—English, Persian, Spanish and Sussana.

CROCUS.—White, blue, purple, yellow, cloth of gold, striped, &c. in 25 sorts.

GLADIOLI.—Bianzum communis, with purple, red and white flowers; Cordialis.

LILIES.—Double and single white, striped leaves, and spotted; Caledonia, California, Martagon, Kamshakian, Aurantia, &c.

POSONIES.—Double white Chinese, double red do., double red and double white, double purple fringed, fronz-leaved, &c.

Also.—Snow Drops, Anemills, Tuberoses, Ornithogilums of all sorts, Arum draconidum, Granium tuberosum, Allium flavum, Hyacinthus monostrosus, planus, botanoides, and elegantis of sorts; Fritularias, Cyclamen, &c.

The above choice collection of bulbs have been selected with much care, from one of the best houses in Holland, and are offered to purchasers at the best confidence, believing they will give universal satisfaction to all who will give them a fair trial. Orders should be forwarded soon to the subscriber, No. 62 North Market Street, office of the New England Farmer. A liberal discount will be made to dealers.

October 23. JOSEPH BRECK & CO.

PEAR, PLUM, GRAPE VINES, &c.

1000 Pear Trees of the most approved kinds; 1000 Plum Trees of the most approved kinds and extra size—many of them have borne the past season;

500 Quince Trees; 4000 Isabella and Catawba Grape Vines, from 6 to 15 feet high, most of them have borne fruit—Black Hamburg, Sweetwater, Pond's Seedling;

30,000 Giant Asparagus Roots; 5000 Wilmot's Early Rhubarb or Pie Plant, lately introduced.

Also—a good assortment of Goosecherries, Roses, &c. of different kinds;

All orders left at this office, or with the subscriber at Cambridgeport, or in Mr Lynch's baggage wagon box, at Gould & Howe's, No. 3 Faneuil Hall, will meet with immediate attention. SAMUEL POND, Cambridgeport, Mass.

Fruit and Ornamental Trees, Mulberries, &c.

Fruit Trees of all the different species;—of the most celebrated and surpassing kinds;—the collection now offered is large. The Catalogue of *Fruit and Ornamental Trees and Shrubs, Roses, and Herbaceous Flowering Plants, for 1839*, is ready and will be sent (with) who apply. In that catalogue are the very best kinds of fruits, so far as proved, are particularly designated by a star.

100,000 MORAS MULTEICAVUS Trees or any other reasonable quantity, or cuttings of the same, are now offered. The trees are genuine; all being raised by the subscriber, either at his Nursery here, or at his Southern Establishment at Portsmouth in Lower Virginia. Also the Elata, Canton, Broussa, Monro, or Albany, and some other Mulberries, Goosepaw and Buckthorn for Hedges, &c. &c.

All orders will be promptly attended to, and trees when so ordered will be securely packed for safe transportation to distant places. WILLIAM KENRICK, Nonantum Hill, Newton, Mass. Oct. 9.

FRUIT AND ORNAMENTAL TREES, &c.

An extensive assortment of the finest varieties of Fruit Trees, and a great variety of Ornamental Trees of large size. A fine collection of Herbaceous Plants, Roses, Honey-suckles, Peonies, &c. 80,000 genuine Moras Multicaulis Trees, of large size, the growth of Virginia. Also—1000 bushels of Rohan Potatoes, orders addressed to the subscriber will receive prompt attention. Newton, Nov. 1, 1839. JOHN A. KENRICK.

GREENHOUSE GLASS,

All sizes and qualities, for sale by LORING & KUPPER, No. 10 Merchants' Row. November 6.

SLEEPING WITH THE HEAD COVERED.

Before the danger of sleeping with the head covered can be realized sufficiently plain, it will be necessary to state one fact in Physiology, to which we have not yet adverted.

The same change of the blood from bad to good—from pure to impure—which is effected in the lungs, is effected also, in some good degree, on the whole surface of the body. Some of the insects or worms, may be said to breathe entirely on the surface of the body. They have no lungs whatever. As we rise in the scale of existence, to snakes, &c. we begin to find lungs or gills, in which a part of the change of blood to which we allude, is effected. Rising still further in the scale of being, we find the lungs larger and larger, and the skin less and less concerned in the change, till we come to man, and some few other animals, in whom the change is almost wholly accomplished by the lungs. Still, we repeat it, the skin, even in man, has some share of the work of renovating the blood to perform, as may be readily shown by a very simple experiment, like the following.

When a person has lain several hours in a bed, closely covered to the neck with thick covering—say with the modern article called a comfortable—let a candle or lamp be introduced under the clothing, and it will soon be extinguished. The oxygen is so much diminished, and the carbonic acid gas so much increased, as to be incapable of supporting combustion; and by the same rule, unfit for respiration. Let it be also distinctly understood, that this change is wholly effected without the agency of the breath; though when the head is covered, it is, of course accomplished much faster.

This fact, that we breathe, as it were, that is to say, purify the blood and poison the air with the whole surface of our body, as well as by means of the lungs, is of the utmost practical importance. It is of importance to be understood by those on whom we urge the duty, of keeping the skin clean; for how can a foul skin—a skin varnished over with dust—perform its delicate and important functions? It is of importance to be understood in order to know how to clothe ourselves; for all these forms and circumstances of our clothing which tend to embarrass or interrupt the action of the skin, in its work of assisting the lungs to purify the blood, are, of course, objectionable. It is, however, of still higher importance, that it should be well understood by mothers, in the managements of their infants, not only in regard to cleanliness and dress, but particularly in regard to sleep.

For, in the first place, the bed clothing ought to be as loose and porous as it can be, and yet at the same time retain a sufficient amount of heat, in order that the carbonic acid gas may have opportunity to escape, and the purer air to find its way through it. Secondly; The clothes ought to be often thrown open, and the air under them thus exchanged for better. Thirdly; The child ought never to be allowed to sleep with its head under the clothing. Immense is the mischief done in this way, as we have already said, by ignorant parents, and even by those, whose fault is more that of carelessness than of ignorance. Fourthly; He should sleep alone as much as possible, either in a

bed or a crib, rather than with parents, brothers, sisters, &c. Fifthly; He should never be permitted to have domestic animals, as favorite dogs or cats, sleep in the bed with him—a practice quite too common in our country—especially that of having a puppy in the bed. The child's body poisons the impured air quite fast enough without any aid from dogs and cats, or from other human bodies; and above all, without being aided by his own breath.

What has been said in relation to the management of infants, will be generally applicable—the principles which it involves will, at least be so—in the management of childhood and youth, and in old age. Does without flues, lamps, candles, breathing, the action of the skin, (if not prevented by dirt, improper clothing, &c.) and many more causes, will continue to operate to deteriorate the atmosphere every period of existence. There will be no moment of our lives when we shall not need the whole rective force of a free, vigorous pair of lungs, and a healthy skin, to form and reform the blood and to cast off the poisonous carbonic acid gas which is burned by these important processes. There will be no waking moment of our lives when we shall not need to be constantly on the watch—at least as much as our circumstances and employments will admit—against an agent which will threaten our destruction, and which, after we have done our best, will probably gain, more or less, the dominion over us.

Hence the importance which philosophers, in all periods of the world's history, have attached to pure air, and the concessions which have been made—ground as mankind have been, and ashamed of, and averse to labor—in favor of agricultural employments. The habitual breathing of pure air, with plenty of active exercise, will counteract, in no little degree the bad tendency of a host of the ordinary physical transgressions.

STOVES.—Medical men state that the innumerable complaints to which persons are subject during the winter, are not the effects of the cold, but are produced by the use of stoves, the heat of which it is difficult to regulate. The air of a room in which a stove is used becomes at length completely dry, unless care be taken to keep up the supply of moisture by having constantly in the room a vessel filled with water. From the air becoming dry, the cells of the lungs become ultimately deprived of their necessary fluid, the skin of the face and hands become heated, and headache ensues.—*Dost. Treat.*

The Illinoisian speaks of a field of fifteen acres of land on Fox river, which yielded 45 bushels to the acre, and was the first year the soil had ever been cultivated.

The committee on a Geological Survey of Vermont, have reported to the Legislature in favor of the same, and of an appropriation of \$6000 to carry the same into effect.

More Patriot Troubles.—It is said that the patriots on both sides the lines are again preparing for winter operations. We sincerely hope it is not so, but from the fact that the Secretary of War has ordered Gen. Scott to make the tour of the frontier, we fear there is too much truth in the rumor.—*Rochester Dem.*

They are luxuriating on green peas at Wilmington, N. C.

A Patriot gone.—The Belfast (Me.) Journal records the death of John Cochran, who made one of the famous "Boston Tea Party." He was born in Boston, and removed to Belfast a number of years since. He was a man of good property, which is not always the case with our revolutionary veterans and highly respected by a large circle of friends.

Subscribing to Lectures.—A gentleman being called on to subscribe to a course of lectures, objected, because," said he, "my wife gives me gratuitous lecture every evening."

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO at the New England Agricultural Warehouse and Seed Store, Nos. 31 and 32 North Market Street, have for sale, Green's Patent Straw Hay and Sift Cutters, operating on a mechanical principle not before applied to any implement for this purpose. The most perfect in its construction, and some of the consequent peculiarities of the machine are:

1. It secures a reduction of the quantity of power requisite to use it, and the strength of a half grown boy is sufficient to work it very efficiently.

2. With only this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine, even when worked by horse or steam power.

3. The knives, owing to the peculiar manner in which cut, require sharpening less often than those of any other straw-cutting machine.

4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable to the complicated machines in general use to get out of order.

WINSHIP'S BRIGHTON NURSERIES,

AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creeper, Herbiaceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs WINSHIP Brighton, Mass., will be promptly executed and forwarded to any part of this or other countries. April 10.

ROHAN POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, at 5¢ per barrel. October 10. JOSEPH BRECK & CO.

Fruit and Ornamental Trees, Flowering Shrub Plants, &c.

The present being the most favorable season for transplanting all hardy trees and shrubs, we would remind those who are in want of Fruit or Ornamental Trees, Shrub Herbiaceous Plants, &c. that we can furnish them at the notice at nursery prices, well packed for transportation to any part of the country. JOSEPH BRECK & CO. October 15.

TORUS MULTICAULIS.

6000 Multicaulis from 2 to 4 feet high, wood well ripened now standing in the field on the Jones' Place in Angell Street half a mile from the Providence Market, for sale low (if it be in the field) by JOSEPH STEPHENSON on the premises, on application to STEVENSON & HODGES. Providence, October 23.

PEAR TREES.

For sale at the garden of the subscriber a large collection of Standard and Dwarf Pear Trees, comprising most of the choice varieties of European and American origin. Orders by mail will be immediately answered. October 16. ROBERT MANNING.

DOMESTICATED WILD GESE.

A few pair for sale. Enquire at this office. November 6.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay with sixty days from the time of subscribing are entitled to a discount of 50 cents.

AGRICULTURAL.

For the New England Farmer.

BEST TREES—THEIR IMPORTANCE—SOWING THE SEED.

COLMAN—When we witness the rapid diminution of the primitive forests of New England, and upon the intense rigor of our winters and increasing demands upon our woodlands for purposes than that of supplying fuel for an increasing population, we cannot but be anxious, in aid of those who are to come after us, as to the whence they are to derive one of the most necessary articles to their comfortable existence—timber for fuel and other purposes. We are aware that our fears are deemed foolish by some, for they point us to our groves, whose "tall trees" have long since passed away, and to our tains, whose rugged sides and "airy tops" afford defiance to the vernal excursions of the sun, and exclaim, "the growth is greater than consumption." This however is not the fact; groves are hardly sufficient to shield poets from a summer's sun, much less to protect from the cold winds of winter, while our tains are literally exhibiting the appearance many mighty Sapphoes, when of their bean-locks, with the Phœnixes still gath'ring d, to take the last remnant of their strength

are led to these remarks by an inquiry in a paper of October 24, as to the best manner of the seed of forest trees, a process which, if successful, we have no doubt may be profitably employed in covering many lands which are almost useless for other purposes, with a growth of timber the increase of which would give a rich percentage, and in a course of years become valuable. If and when taken up, leave the lands in a state for cultivation.

We know of no better way of aiding nature, than serving her process and confirming our operations thereto as nearly as possible.

When we see a forest spring up and grow, we may well examine the condition of the soil which its rudiment vegetated.

On an examination, that trees which spring up in fences have the most rapid growth of any in lands. An obvious reason may be offered for it so. Such places are usually the richest of our fields—quite too much so to allow them to overrun with thorns and thistles, and thereby continues to increase by leaves being deposited beside them, as long as the old fence continues. We give one example of a tree—an oak—sprung up on our own premises, and which, in our own convenience, we have sown down since inquiry of your correspondent reached us. On an examination we found it contained nine cortical layers and was fourteen and a half feet high. It must have originated from an acorn, as there is no sinuosity in many rods. It must have been slightly buried, unless the squirrels buried it deep. It had

a fine light soil, which we deem important to the successful vegetation of all seeds.

Your correspondent inquires how chestnuts should be sown. We have never sown any, for we have a plenty of the timber without, and a prospect with good management, of its continuation from self-sown trees. We can tell him how nature sows them. The land on which chestnut grows in the forest is generally light and free from grass and weeds. The fall of the fruit and leaf is about the same time, and from beneath its covering of leaves, the fruit the next spring sends up a new tree. We would not, however, recommend this covering of leaves in open fields, lest they blow away and leave the fruit bare, or if they remain, they become so dry as to prevent germination. A slight covering of mould must supply their place.

The lamented Judge Buel, whose praise is in the mouth of all good farmers, and who, though dead still speaks and must long speak to us by the practical precepts he has given, says—(vide N. E. Farmer, vol. viii. page 161)—"On the 5th of May 1827, I repaired to the banks of the Hudson with an assistant, and collected seeds of the soft maple, some species of the elm and of the buttonwood, which were then falling—the latter of the preceding year's growth. They were planted the same day, very thick, in beds of mould. They immediately grew and the plants attained some size that year. Last week [the article is dated Nov. 28, 1829,] I transplanted some of the maples for ornamental trees, which were from ten to fourteen feet high. Some of the buttonwoods were ten and the elms six or seven. This in thirty months from the time of planting the seed." Judge B. then goes on to state his process of planting out these hundred more of these trees, which he obtained from "a space less than six feet square," and transplanting them at a "space of about four and a half feet" to form a screen on the side of a field, which in fifteen years he supposed would do to cut for fuel, and would continue to renew itself fit for the axe, by sprouts from the stumps once in fifteen years. He also stated that the expense of his trees thus far did not exceed \$30.

Your inquirer says that he planted his trees on grass land, some of which is dry and solid, the rest meadow,—all favorable to the growth of wood, large forests having grown there in time back.

Is it not probable that his land has become too solid? an event which will take place where long cultivation is followed, by the exhaustion of the fine vegetable mould, which is important in accelerating the growth of young forest trees. Did not his thrifty young trees of natural growth, in the north end of the field, start up while the land was yet new, perhaps by an old stump, or by an old fence, or did they start up in grass land?

If we wished to plant the seeds of trees of any kind, we should pursue the plan of Judge Buel—prepare us a summary of good vegetable mould, of such size as we thought best, then we should gather our acorns, chestnuts and walnuts, or other seeds, when they fall from the trees, and sow them *immediately and liberally*, broadcast. At a suitable time

we would transplant them—a ceremony which may be rapidly passed through, and we should be very sanguine of success. This may lead to your inquiry like a roundabout way of getting to the wood, but we would rather take it than to meet with a disappointment similar to his, for in this way the trees starting from a soil congenial to their habits, would be healthy, which would enable them to push forth more vigorously in his land, dry and solid, than though they had originated there, plants of slow and sickly growth.

Since we are on the subject of trees, which it appears is quite a hobby with us, we ask leave again, as a suitable season for the operation is now on hand, and as the busy season of the farmer is past, to call the attention of your readers to transplanting. Last spring, we all paid our highway tax most cheerfully, in anticipation of smooth roads to pass over in our business and pleasure excursions during the season. We have been more than compensated for the few shillings assessed against us, by the luxury they have brought. Next spring the tax must be repealed—it ever has been, and must be still, and it will be cheerfully paid as long as good roads are in repute.

We propose another tax or rather a donation, for the benefit of ourselves and the traveller, which if once well discharged, will need no repetition for ages—it is nothing less than transforming all our highways into beautiful avenues. And would each town in "Old Massachusetts" appropriate the same amount of labor in effecting this object which they have given this year to repair roads, the object would be accomplished, and "Old Bay" would set an example to her sister States in no way reproachful of that which she set them in the days of the Revolution. We are happy to see that in many parts of Berkshire, they are beginning with new zeal, especially to fill the greens and vacant places. May the work become a contagion, and spread until it has extended into every lane and by-corner of our country.

Yours, truly,
Mount Oscola, Nov. 4, 1830.

W. B.

WORCESTER AGRICULTURAL SOCIETY.

Judges of Swine.

William Lincoln, Worcester, Chairman; Artemas Lee, Templeton; Nathaniel Rand, Lancaster; Ebenezer D. Amundson, Southbridge; Otis Adams, Grafton; Charles Sibley, Barre; Abel Whitney, Harvard; Warren Hunt, Douglas.

REPORT.

The advancement of the Society in prosperity and usefulness may be measured by the progress of improvement among the swine. In 1833, twenty-seven of the most interesting of all the animal races, greeted the festival of the Farmers of Worcester; in 1834, eighty-one have honored the husbandman's holiday with their presence;—in 1835, there were only two hours at the show; in 1836, eighteen have been present;—in 1837, six competitors entered in-

to the peaceful contest for premiums; in 1830, twenty-four have quietly disputed for prizes and raises;—in 1832, two towns of the county were counted here; in 1833, eleven towns of the commonwealth have represented the uncommon wealth of pigs.

Our schoolmaster has been abroad. Abel Whitney, Esq., who was and is a "judge of swine," has been absent with the ploughs which he now uses instead of pencils and slate. Had his associates been at home in the arithmetic that excellent instructor and ready reckoner imparted to his pupils, the precise relations of the past and the present might have been given. Deprived of his countenance, the sum can only be stated in the simplest form. It may be assumed, that as 27 are to 81, and as 6 are to 24, and as 2 are to 11 and 18 so were the persons, pigs, and places of 1833 to those of 1830; and so are the various merits of the first fair to the multiplied excellencies of the last exhibition.

Eighteen boars were in the pens;—out of the pens there were other boars; but they were not entered for the premiums they deserved.

The committee were invited to unite with the delegation of the Massachusetts Society for Promoting Agriculture, in bestowing the liberal rewards offered for the encouragement of good breeding in Worcester county. The honor of the appointment was enhanced by the pleasure of being aided in the execution of the duty by the Hon. Jos. Welles and H. Codman, Esq., of Boston, and by the advice of the Commissioner of Agriculture, learned in the laws of the land.

The equality of excellence of swine produced a variety of opinions of committees. The late James H. Clapp, of Belchertown, son of an illustrious pig of the Berkshire family, was round square, long and broad, fat and finely formed, high descent and pure blood. The boar of Mr. A. Knox, of Grafton, descended from the same race on the father side, inherited the same qualities possessed more than the grades of his ancestors. Their heads were similar, but the difference was to find that the one may be divided more easily than the other. The committee of the F. C. Society, deputed to award a premium of twenty dollars to the best boar, were tititors when they would have done otherwise, if possible, to have given the first premium to the one who had instructed the chairman to report, that he bestow one gratuity of ten dollars on Mr. Knox, and another of the same amount on Mr. Knox.

Fine representatives of the four-farred pig of Berkshire were there two animals. In the points of good hogs, the small head, short body, broad back and large hams, they were exemplary. To those qualifications were added ears as silky, eyes as bright, and faces white as milk, as have ever been worn by any hog. Their early maturity and ready disposition to fatten completed the character of perfection. The committee represented that they were smitten with the aptitude to fatten it was such that they could almost live without food, and they would grow more than nothing.

The art of eating is coeval with the art of living. Eating is uniform; have you ever seen it has been carried on in many ways. The *work* has been popular among all nations; it has not furnished steady employment, and at times has been over laborious. *Living without means* has been practised in all ages, but never

rose above a mean condition. *Living by one's wits* has been attempted, but the business has always failed for want of capital. *Living without eating* has not been extensively used. There is an ancient account of a quadruped who taught the mystery, but as soon as he acquired it he perished, and the secret died with him. Amateurs less gifted with legs, have endeavored to revive the discoveries of the old world. While millions of well filled pots, so many as did those of the founders of independence, send up their savory increase at noon-tide from house and hotel, there are some who drop the solid substance of beef and pork to grasp at the fleeting shadows of it, until they become so delicate and pale as to have no blush in the shade, and to cast no shadow in the sunshine. Aged error and youthful refinement, like other extremes, have had a meeting. The spendthrift of old wasted his substance in sumptuous banquets, till necessity compelled him to partake of the funeral fare of the swine of Palestine. The prodigal of health in modern days, returns to the feast on husks, but the swine are not guests at his board, nor do they become revellers on the banquet of air.

It is but too true, that the manly and vigorous appetite of our forefathers, which could compass both the solid and the liquid, and disperse who e fleets of the wind, and the wings of birds, to sustain their athletic and manly powers, has sadly declined. The capacity of the body capacities of the mind, and the strength of the limbs, which, by the use of spirituous and whiskies, which, by their use, are made to the mouth, tend to exhaust the animal power, to waste direction, and in consequence, to deprive that great charter of health which is the inheritance of the constitution.

It is the duty to return to the pigs, who are the victims of extravagancies.

Harvey and A. Knox, of Grafton, might be considered fortunate without the repetition of praise respecting his merits. He came to the fair at the age of six months, two days ago. He weighed at the time of 270 pounds at 9 o'clock this morning. From the testimony of his rapid increase in bulk and fitness, may be much heaved to the credit of the blood of the Macomber.

It is thought by his maternal ancestors who were made him more excel in all the stamens of a pig. He bore the name of *Majar*, was worthy of that high rank in the infantry.

He claims to be the *five dollar beauty* for his services in the department of national defence, which he has performed as the citizen soldier, and invigorated the right arm of the state by providing ready for his militia, were too strong to be denied, and the County Society's first premium was awarded to him.

The second premium of three dollars was awarded to Peter Peck, of Southboro, for a full blooded Colburn boar, of the age of 7 months 9 days, and weighing at the time of 250 pounds.

The members of the committee were not diminished by bestowing two premiums where eighteen were wanted. There remained a crowd of competitors deserving respectful notice.

The United Brothers of Harvard, exhibited a Berkshire boar, whose appearance was evidence of the success of the society of Shakers in keeping every creature connected with them in good condition. He carried his notions of neatness and propriety so far as to decline the exercise of rooting lest he should soil the cleanliness of his nice black coat. The committee recommend that a gratuity

of \$2 be given to Seth Blanchard, in behalf of the Brothers of Harvard, as a slight testimonial of a probation for the improvements in good farming made by that industrious community.

The Berkshire boar of Eden Davis, of Webster, seemed to be aristocratic in his manners. He arrived in a cart drawn by four oxen and did not alight from his carriage to enter the parlors provided for the pigs with carpets of green turf and wadding of chestnut rails; but this proved to have been owing to the rooms being entirely preoccupied. Mr. Davis would benefit agriculture if he would allow his pig to continue locomotive, and him run to every farm which could be reached by ten a strong and well trained as that which is joined in the honor of drawing his pork. It is recommended that the Society bestow a gratuity of two dollars to Mr. Davis, to be expended in food and lodging for his excellent animal, as a compensation for the misfortune of being excluded from proper place.

While the supremacy of the breed of swine from Old England has been acknowledged, the claim of that of New England origin must not be neglected. The boar of Marvin Wesson, of Phillips, was of the "Miller's breed," and looked as he had taken toll from the meal of his master, to enable him to repay the debt by furnishing him with a number of meals. It is recommended that a gratuity of two dollars be bestowed on a pig having solid and substantial worth of Yankee character.

We need pigs, not less than four in number, numerous, with all the premonitory symptom of future excellence. The first premium of six dollars for the rising generation of swine, is awarded to Harvey Dodge, of Sutton, for four Berkshire who promise much to benefit posterity. Seven of William Eaton, of Worcester, sturdy New Englanders, received the second premium of \$3.

Whenever it is necessary to approach female society, it is proper to proceed with great caution. In this opinion the members of the committee, being constitutions around their firesides to whom are responsible, could not formally concur without consultation.

The sow of Eleazar Porter, of full Berkshire blood, brought with her five interesting testimonial of her accomplishments in good breeding, in pleasant little pigs. Her own fair face and rounded form were so satisfactory proofs of good living of the American Temperance Hog that the certificate of being kept well at the place where she resides, was not examined.

A venerable Berkshire matron of Harvey Deane, of Sutton, appeared in a cart. If there was a room without her carriage, there was no way any thing but room within. Her narrow pen ornamented with a flourishing family, and this well of the swine in her humble apartment, m like the Roman mother, have pointed to her dress and exclaimed "there are my jewels." This breeding sow, the second premium of five dollars is awarded.

Massachusetts has encouraged that is universal and excellent. Her government has cherished agriculture by appropriate fines cities, by paying for careful survey, by bestowing bounties on the production of grain, and by employing first talent in developing the resources of the soil the best modes of cultivation. Her citizens improvement as they fatten pork. The commonwealth gathers up precepts and holds practice to teach by examples. Great ex-

worthy of imitation, were fifteen swine of the Bay State, from the Lunatic Hospital. The circle that all things have beginning, middle, and end, has some exceptions: the hogs of Massachusetts seemed to be without particular beginning and end, with nothing middling. They would have a cuber of pork if they had not been rounded spheres for the more perfect symmetry. They are sober and solid, as all is belonging to the institution of which they are members. They were recipients of despatches from the Superintendent, communicating a remarkable instance of resistance to authority and order of their home.

Two of the fittest and best of the swine," says Dr Woodward, in his letter bearing even with these presents, "remain behind. Before I left the sty they manifested repugnance to the exercise of the authority which disturbed their repose—they were urged to advance till they had reached the pen, when they turned up their noses, and refused to advance. They were flattered and caressed without good effect, and finally were compelled, but to no good purpose. They seemed to have that they had state rights and could nullify measures of their general government. Their pride could not be roused by the prospect of seeing public, or even by the promise of meeting the eyes of swine"—nor could their sense of justice be excited by the argument that their good piping deserved from their cheerful acquiescence in the arrangements of the great exhibition. So that their ideas could be understood by those who do not study their language of signs, they did like the law which compelled them to remove from the places of their business where they had accumulated large personal estates—they regarded it as anti-sumptuary—and questioned the power well as the right to enforce such enactment."

These bold rebels have been placed in close confinement in the custody of a faithful keeper, there to remain with no better food than bread and water, and if they should be converted to non-resistance, should they continue contumacious, they will be brought to trial at the next December term of the court, and the painful necessity will exist of inflicting capital punishment for their offences.

It should be remarked, that to drive a pig pleasantly is an accomplishment as rare as it is elegant. This branch of education has not yet been introduced in the seminaries for instruction—it is not taught in the Normal schools, or the colleges of New England—it can only be learned in the university of nature. Much mischief and great diversity of practice have resulted from the neglect of study of the art. Some have attempted to enslave the pig into the way in which he should go, by moral suasion of meal: if he was of the gentle Berkshire race, he would seriously incline his ear to an ear of corn, but not infrequently halted. Others have preferred the coercive process of fasting—the fifteen-stranded cord of compulsion around his nose: if the pig was "striped," he would not give an inch on such terms. Neither time nor care allow the discussion of the comparative advantages of the two modes, or the attempt to reconcile the discordant views in regard to being led or driven.

Some of the swine who obeyed the summons to me from the Hospital, looked as if they had forgotten to bring their heads. The omission might have been considered contempt, and to have justified sentence to a confinement as severe as that recent-

ly endured by witnesses who have been unanswerable in other courts, to stand committed until liberated by the habeas corpus, which enlarges the body of pork from the prison of the barrel. But it appeared that for the convenience of travelling, they had packed their heads too deeply in their trunks to be again taken out. The dissolution of the copartnership existing between head and body, by the pressure of rope or the motion of knife, is not considered agreeable: to have the chief end embalmed in pork must be delightful. While these animals remain under the care of Dr Woodward, the loss of the extremity is of slight consequence. At the Hospital, second hand heads are cleaned, repaired, and refurnished, so that they go as well as new ones, and perhaps the skill which exists in that institution, might take down a small understanding and set up a larger one.

It would be impossible in one day to express the sentiments of the committee in viewing the congregation of swine. They can only hope to delineate the virtues of 81 hogs by appending 81 notes, exhibiting portraits of the manners, morals, feeding, breeding and fitness of each. Compelled to part abruptly from their friends, they can only state generally—that the boars of Lowell Sibley, of Sutton, half Roebrook; of Joseph Jepherson, of Northbridge, full blood Leicestershire; of Alfred Mower, of Charlton, of the Berkshire family; of Amory Holman, of Bolton, one fourth Mackey and three fourths Grass bred; of Lewis Chapin, of Worcester, native born; of John Barnard, of Worcester, from the Bigelow stock; of Aaron Howe, of Shrewsbury, half Berkshire and half Leicestershire; of Lovell Southwick, of Sutton, with the Bedford feather; of Eleazar Porter, of Worcester, one of the Headless Hogs of the Hospital; of Benjamin P. Rice, of Worcester, a citizen of New England; of Levi Bowman, of Westboro', of the Berkshire breed; and of Harvey Dodge, of Sutton, one fourth Berkshire and three fourths Grass bred—have failed to obtain premiums; not by reason of any deficiency in their own merits, but by reason of the extraordinary excellence of their successful Berkshire rivals. We must not covet our neighbor's goods: every member of the society might honestly desire to have all the pigs of these gentlemen, and must wish that each of them should receive thanks for their exhibition of fine animals.

It is necessary to be long when there is no time to be short. Far towards the last in the order of reports, come the "Judges" of the society and the swine: in the order of merit the last should be first. Bulls are good—oxen great—heifers graceful—and all the best stock in and out of the husbandman's household, elegant and amiable: Hogs are ornamental and useful. They constitute the beautiful of the farm yard. They fill that remarkable space, only one step wide, separating the sublime from the ridiculous. The swine have stood in the dignity of conscious worth while the whole delegation to the annual county convention of herds and flocks have gone by. It has been their consolation under the preference given to others in the procession, that for them the post of honor was a station in a private pig pen. There, surrounded by attentive friends, with the affections of those who have fed them and in their turn will be fed by them, and the endearments of domestic circles, supplied with happiness by the painful three times a day, they could fill large places in life, and fill many platters of the hungry in death.

If yesterday had been to-day, or to-day was to-morrow, the report of the committee would have been more brief;—in short, if this year had been next year, the chairman would have had the honor to report nothing.

All which is respectfully submitted.

WILLIAM LINCOLN, *Chairman*.
Worcester, Oct. 9, 1833.

From the New York Observer.

DR. HUMPHREY'S THOUGHTS ON EDUCATION.

School Houses.

Are they where and what they ought to be? A great deal has been written on this subject, within a few years past, and there is, in some places, a manifest improvement in school house architecture; but I suspect that even now some thousands of school houses might be pointed out, within the bounds of New England and New York, to go no further, which are anything but neat, pleasant and convenient. I might call them *juvenile prisons*, if they were not so slightly built, and kept in such miserable repair. But whatever they may be like, let us go and visit one of them. There it stands, on a burning sand bank, or upon the margin of a dead swamp, because the place is *twenty-five rods and a half* nearer the centre of the district, than the fine verdant lawn upon which some of the proprietors were anxious to have it built. Every thing around is desolate and forbidding. The school has opened for the winter, and the glazier is coming next week to mend the windows; which, however, seems to be a needless expense, as by careful use, the boys' hats, which now supply the place of *seven by nine*, will last till spring. A little wood there is, piled up under the snow; but it is as green as a Norwegian pine, and if it were dry, there is no sign of a wood house to shelter it from the weather. This looks dreary enough, in a sharp winter morning, but let us go in; perhaps we shall find things better than we expected. Not at all. See how small the rooms is, how low the ceiling, how badly constructed the stove, or fire place, how high and rickety the slab frames, how closely huddled together the smaller scholars, half roasted on one side and half frozen on the other; how awkwardly and miserably fitted up the writing desks, how snow-blinding the light for want of curtains to exclude or soften it; how—but why should I go any further? If you wish to remain longer, I have no earthly objection, provided you will release me from this carbonic and saporific confinement.

Now I am aware, that this may be put down as an extravagant and slanderous ebullition, by some of your readers; but if any one can prove to me that there is a grain of caricature in the picture, I will reward him handsomely for his trouble. At any rate, when I had the honor, in successive winters, to exercise some of the youthful regiments of H— and L— counties, in common school tactics, it was nothing strange to have the necessary repairs put off till the last moment before the opening of the school—nay, to have the mason come in with his trowel, and the glazier with his patty or bits of tin, in the midst of our spelling and reading; to see a badly yeoman drive up, with the first load of green wood, or of what he had picked up on his farm in the last stages of decay, to make room for more to fall down and rot, against the next

season; to go sometimes to the school house in the coldest weather, and not find a handful of fire or a stick to make it of; to wait and shiver and rub the icy fingers of the smaller children, till the larger boys could go and borrow an axe, and dig out and cut an armful, and thaw off the ice, or as the case might be, finding no wood to disinter, to dismiss the school till somebody could be put up to bring on his load. All this and more I have seen and experienced myself; and in districts too, which prided themselves in being rather in the fore-ground than behind the times. That, however, was a great while ago; and school houses, perhaps, may be better now; wood may be better, and there may be more of it. But how much better? If any body will agree to pay me a generous premium for every school house I can find answering to the above description, I will make a short excursion during the next vacation; and in case of failure, I will "own beat," and bear my own expenses.

It is certain, at any rate, that our school houses in the country are for the most part fitted up with less regard to health, convenience, and attractiveness, than any other class of buildings. While every man of good judgment, in building his own house spends a great deal of time and thought in planning other conveniences, he has regard also to the health and comfort of his children in the size and arrangement of their sleeping rooms. The reflection that it will cost him a few dollars more, to give them good than poor accommodations, weighs very little with such a father. "What is property good for," he asks, "if it is not to make ourselves and our families comfortable? My children will never thank me for thrusting them into some bye corner, in their tender years, for the sake of leaving them a little more to spend after I am gone."

Nor is the care of our men of thrift and enterprise confined to their children. It extends to all their domestic animals. The farmer will not only invite you to look at the good condition of his cattle and horses, but will show you what pains and expense he has been at in the fitting up of sheds, racks and stables. The swine, even, proverbially bristling and *contrary*, though they be, must have spacious accommodations and warm beds as a matter of taste and economy. But when these same indulgent fathers and thrifty husbandmen come to the matter of their children's education, they *guess* the old school will do another year. It will want a few shingles and some other patching, to be sure, but then it looks about as well as it did ten years ago, when every body was satisfied. Besides the times are hard, and they have just been laying out so much money in building or buying land, that they have nothing to spare. Some dissent and remonstrate; but this is the voice of the majority, and it prevails.

Thus the children of the district, (from thirty to seventy or eighty in number, are compelled to take up with accommodations, in pursuing their studies through the long and cold winter, which no one would think tolerable any where but in the common school—the place of all others, I was going to say, which should be made neat, roomy, warm and in all respects attractive. There must be *aca* stables and *new* plans and experiments to fatten the full-blooded *Bothersies*, but the *old* dilapidated school-house, is almost too good to be pulled down at present.

Nay more: I am not afraid to hazard the prediction, that as the schools open this very season, many a master will find that the repairs are not

completed when he is ready to begin. The stove is not up, or the glass is not set, or the benches are not mended, or the wood is so green and wet, that you might as well undertake to burn salamanders; and that many a teacher will also, in the course of the winter, be literally frozen out, for two or three days at a time, through the neglect of those to whom he is obliged to look for the necessary supplies of fuel. Now if I am not entirely mistaken in these impressions, is it any wonder that the children in so many of our common schools do not make half the proficiency which might, under better advantages, be reasonably expected? How can they do much, when they have to burn off the ice before they can get at the wood, and it takes half the forenoon to warm a space ten feet square, nearest to the fire, and the ink freezes in their pens, and their feet ache with the cold, and every thing in short, is so cheerless and forbidding.

I do not think myself competent, if I had time, to propose the best model for common district school houses; and easy as the task may seem, I suspect that but very few professional builders have studied this simple branch of architecture with very much interest or success. Perhaps the reason is, that it has hitherto been regarded as of little importance. But really, I do not know how a man of ingenuity and practical good sense, could render himself more useful in a very considerable section of the country, than by turning his attention to the subject, and inducing the friends of common schools to build upon such improved plans as would commend themselves at once to every eye. In this way a great and most beneficial change might soon be effected—for I will not believe that the majority of parents anywhere, would rest contented with such unsightly and ill-contrived school houses as are now common, even in many parts of New England, if there were better models which they could be invited to examine.

I will only, in conclusion, throw out some half dozen *inguldras*, leaving the *positives* in more skillful hands. 1.—A school house, then, ought never to be planted down in an unhealthy or an unpleasant location. 2.—It ought never to be without a spacious wood-house and dry seasoned wood or coal. 3.—It ought not to be warmed by a *close* stove. The oxygen and hydrogen are both wanted for respiration. 4.—It ought not to have high benches without backs for the martyrdom of abecedarians, whose feet cannot reach the floors by ten or twelve good inches: and, 5.—The writing desks ought not to be so constructed as to disturb the whole school, whenever the scholars open and shut theirs.

TRANSPLANTING TREES.

The planting of trees, either fruit or forest ones, though too much neglected by farmers, is at times practiced by most of them, and should be so conducted as to not only preserve the tree and prevent the entire loss of the labor, but also to afford it the best means of a rapid and healthy growth. Trees may be transplanted at any time while the sap does not flow—a period among deciduous trees marked by the fall of the leaf; or from October to April, but the time generally chosen is the spring. Convenience, however, should be consulted in this matter, as from the full employment of time in the spring months, the operation is very hastily and imperfectly performed, frequently to the injury or less of the tree.

In transplanting trees, as much of the dirt should be retained on the roots as possible. This will prevent the drying up of the small fibrous roots which are indispensable for the nourishment of the tree, and will in part prevent that shock which plants experience more or less, when removed to a soil unlike that in which they have grown. The long roots, of course, must be cut off, and the fruit trees, those that penetrate directly downward may be spared without danger; but in forest trees the downward shoots should be retained as far as they can be. It is the custom with many in settling out trees, to dig a small hole, but far deeper than in which the tree has formerly stood. In this deep hole the roots are forced by bending, twisting and treading, the dead earth is shoveled upon them, and the trees are left to their fate. Instead of its being a wonder that many perish under such treatment, the wonder is that any survive.

When trees are to be transplanted, the hole the reception of the roots should be broad but deep, as no tree when it is removed should be in the earth more than a few inches deeper than stood before. The vegetable mould and rich earth of the surface should be retained for placing on the roots of the tree, and if there is a sufficient supply of the proper kind, it should be brought for the purpose. The tree should be removed and placed in the spot dug for it with as little disturbance of the roots as may be, and without any bending or bruising of the larger ones. If these are too low they may be cut off, but all should be allowed to remain that the pit will receive. After being secured, the best earth should be thrown on the roots and shaken or gently pressed down till the wind is covered, and the hole filled.

It is necessary that the tree transplanted should be kept firm in the earth until the roots have time to fix themselves, or it will be liable to be loose and blown over by the winds. To secure it in respect, some have recommended that a stake should be driven into the ground, the top of which towards the tree, to which the body is tied. Others, and the practice is generally followed among European planters, place three stout sticks in a triangle form across the roots of the tree, the angles being secured with a stout wood driven into the ground, and thus all shaking or injury from winds is averted. McKnight maintains that in transplanting trees, the greatest care should be taken to give them not only the same kind of soil, but the same exposure, and that the side of tree exposed to the sun before planting, should be so placed as to receive its most direct rays afterwards.

Evergreens require a different treatment: a different time of transplanting from those that they leaves in the fall. The best season for transplanting such is in the fore-part of June, or the part of May, but without some preliminary manure, many so removed will perish. It has been recommended, and the method when tried has proved successful, that some two years before removal one year at least, that with a sharp spade all surface, and most of the other root, be cut out to the distance of two or three feet from the tree, that it then be allowed to stand undisturbed until wanted for removal. The result will be, that earth near the tree will be filled with abundant fine vigorous roots, and if, when taken up, proper precautions are used in lifting it from the bed, may be removed without the least danger, or scarcely retardation of its growth.—*Genesee Farmer.*

IMPORTANT FACTS.

We observe with astonishment and regret, the conclusive evidence which appears in every direction, that the business of agriculture does not receive the attention due to it in this country, but it is treated with absolute neglect, compared with their pursuits. This ought not to be, and the inhabitants of this country will yet learn, that they have committed a gross error by abandoning the cultivation of the soil, for less independent and more precarious modes of obtaining a livelihood.

Who has ever heard of such a state of things as now exists here? We have a soil as fertile as any that the sun ever shone upon; a country almost boundless in extent, and so cheap that any man may purchase a farm with the proceeds of a few months labor, yet we are actually importing for consumption, immense quantities of agricultural products from foreign countries! A people thinly scattered over a land unequalled in fertility, and exhaustless in its resources, are buying their bread at enormous prices, from countries so overburdened with inhabitants, that political economists have feared that the earth would fail to produce sufficient to support them. Such an extraordinary and unnatural circumstance should excite attention and awaken the inquiry as to its cause.

The fault, as we have seen, is not in the soil, nor is the country overrun with inhabitants. It is, therefore, evident that the cultivation of the soil is neglected, otherwise we should be exporting agricultural products, but it is easier to show the fact, that agriculture is neglected, than to find a sufficient reason for this neglect. We apprehend, however, that it will be found to spring in a great measure, from the same causes which have produced much evil in this country, and the bitter fruits of which we are now reaping. The first and chief of these causes, is the inordinate thirst for wealth, which pervades every class of society, and induces men to abandon their legitimate business to engage in some wild, hazardous speculation, in the hope of becoming suddenly rich. It is also too often the case that the farmer becomes tired of the moderate and gradual accumulation of property by the products of his land, and leaves the cultivation of it to engage in the business of commerce or manufactures. He finds out his egregious mistake when it is too late. The property he had accumulated is often squandered and lost in consequence of his ignorance of his new business, and he again sighs for the cheerful and independent mode of life which he has abandoned, when it is out of his power to resume it. We have in our mind numberless instances of this kind, where industrious and prosperous farmers have been led to their ruin, by being induced to lay aside the implements of husbandry, and engage in the universal scramble after sudden wealth.

There is another great error prevalent upon this subject, and that is, the business of agriculture is generally looked upon as less respectable than that of commerce, manufactures, or the professions; and wealthy farmers, instead of teaching their sons their own business, most usually transform them into merchants, lawyers, doctors or divines. This is all wrong. Agriculture is the very backbone of all business, the main-spring of all wealth, and should be regarded as a profession of the highest respectability. It gives those engaged in it a feeling of independence, genuine nobleness without ostentation, honor, honesty, and firmness, well calcu-

lated to perpetuate the fine institutions of our happy country. The truth of the eloquent panegyrics of the ancients upon this employment, may be more easily realized here, than in any other country upon earth. We confidently hope to see public opinion speedily righting itself upon this subject, and to find people seeking their permanent interests, and advancing the prosperity and glory of our wide domain, by engaging more generally in this healthful, honest and independent business.—V. Y. Sm.

THE SUGAR BEET.

The culture of this root has, in many instances, been attended with the most extraordinary success. The Harrisburg Keystone gives in the following extract of a letter from Judge Lewis, some important testimony upon the subject:

"In the month of April last, I planted about an acre of sugar beets, for the purpose of feeding the cattle during the winter season. The ground consisted of several patches, some of which had been used for potatoes the year before. After it was properly prepared, deep furrows were run through it two feet apart, in which manure was afterwards deposited, which was covered by running a harrow on each side of the first, and thus forming a small ridge over the manure. Along this the beets were dropped and covered by means of a species of hand drill of my own invention, composed of a piece of 2 inch plank, about a foot long, in the shape of a triangle, with three old harrow teeth formed like small shovels of the proper shape, and a handle of about 4-12 feet long, with a calibre about the size of a rifle bore, through which the seed were made to descend into a furrow formed by the front teeth; they were covered by the two hind teeth. The seed were deposited in the row about a foot apart. On the 1st of Nov. instant, the beets were taken up. The product of 440 feet was weighed on the hay scales, and amounted to 620 lbs., which, counting 60 pounds to the bushel, would be 13 1-2 bushels. The whole product of the acre at this rate is 1333 bushels. This will ensure me plenty of good milk and butter during the winter, and may serve to show that the beet is worthy the attention of farmers who have no intention to make sugar. I consider a bushel of beets nearly equal in value to a bushel of oats. 1333 bushels at 30 cents would make the yield of an acre \$405.90."

As we ourselves dabble a very little in farming, we will add the particulars of an experiment of our own in raising the sugar beet.

A patch of three quarters of an acre was twice ploughed *very deep* and *very richly* manured with stable manure, after having been well *limed* (100 bushels to the acre) the preceding year.

The seed was planted by hand in drills, and when the plants were up, they were thinned out by hand, so as to leave them about a foot apart in the drill.

The ground was kept tolerably free of weeds till the plants had obtained a considerable growth, after which they were not much attended to.

The beets were gathered during the first week of this month, and the produce was 650 bushels—weighing fourteen tons six hundredths!

The hogs and the cows eat them greedily, either raw or boiled. The horses as yet refuse, although mixed with meal—or sprinkled with salt—or whether raw or boiled.

The value, however, of these vegetables for

milk cows is very great. It improves both the quantity and quality of the milk, without imparting to it any disagreeable flavor.—*Whany paper.*

From the American Farmer.

THE CHINESE TREE CORN.

JOHN S. STANBRO, Esq.—Dear Sir—I purchased 1 bushel of Golden B. Smith, Esq. an ear of the above corn which had been grown by Mr Grant Thorburn, of Hallett's Cove, New York, a part of which I planted in a bed in my garden, and as the success which has attended this experiment may, in part, be owing to the preparation of the ground and mode of culture, it may be as well to detail it.

The bed was at first highly manured with fresh stable dung, then spaded deep. The ground being thus prepared, I had holes dug four feet apart, about four inches deep, in each of which I dropped two grains of corn, the which I covered with a compost of equal parts of spent ashes and rich mould.—When the corn first came up it looked yellow, and supposing that it might be owing to too much acidity being in the ground, I sprinkled over each hill about half a gill of equal parts of air-slaked lime and plaster of Paris, which I mixed with the soil by gently stirring the earth round the plants of corn. I subsequently gave it three thorough weedings and hoeings, taking care each time to make my hoe penetrate deeply into the earth, and each time increasing the size of the hill around the roots. As directed by the notice published by Mr Thorburn, I have suffered the suckers to remain, and from the luxuriant appearance of my corn, and its prolific yield, I have no doubt he has hit upon the right plan of cultivating it.

Attracted by its fine appearance, I was induced a day or two since to go into the patch and count the number of ears upon some of the hills. Upon one I counted ten, upon another fourteen, and upon a third nineteen ears. This, being from two grains of corn planted, must be considered a good yield.

This corn is a pealy white, of the flint variety, the ears medium size, and I have no doubt will make an excellent crop of corn. It grows to the ordinary height, yields a great abundance of fodder, and is withal an early corn, having been sufficiently advanced two weeks since, for roasting ears.—On strong ground, well manured, with suitable culture, I have no doubt it may be made to yield an average acreable product of a hundred bushels.

By some mistake, two dozen ears of the same corn were pulled some days since for table use, and I have no hesitation in saying that it is equally as sweet as the sugar corn, with this in its favor, that the ears are nearly twice the size.

Whether this corn originated from a few grains found in a chest of tea, as asserted by Mr Thorburn, I will not pretend to say; but of this I am certain: it is a most excellent variety, and is worthy of extensive cultivation.

Should this hastily written note be deemed worthy of insertion, you can give it a place, and oblige your obedient servant,

EDWARD P. ROBERTS.

Mulberry Grove, Baltimore Co., July 31, 1839.

The wool raised in Vermont this year is worth three millions of dollars, estimating it at an average price of fifty cents a pound.

Show fell to the depth of six inches in the western part of this State on Thursday last.

NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, NOVEMBER 27, 1856.

MATERIALS FOR MANURE.

It seems almost a work of supererogation to call the attention of farmers to a subject which we have so often and so strongly urged upon them, as that of increasing their manure heap by the collection of every material to which they can have access. But we shall continue to do it on every occasion when we are likely to get a hearing. A continual dropping will wear away a stone; and possibly we may make impression at last upon some minds that are perhaps a little softer than granite.

Until the snow comes and the frost completely locks up the ground, materials may be found in all directions and on every farm, which will amply repay the labor of collection; and labor at this season can be more easily obtained than in many other cases. We are continually struck with this fact in our tours through the country; and do not admit that our farmers ought to be satisfied until they are as frugal and saving and parsimonious as the Chinese.

By way of illustration we will try to recollect a few things which met our observation recently, we shall not say where, on what road or in what neighborhood, lest we might sour the milk of some of our good friends.

We passed in the first place a grove or forest with the ground covered with fallen leaves and rotten wood. Why might not these have been collected and being deposited under cover, furnish a fine mass of excellent litter for the cow and the horse stables, and the sheep yards through the winter, from which after being surcharged with the liquids from the barn, they may be applied to the cultivated lands with no small advantage? These woods were at the border of an extensive pasture, covered with brakes, and sweet fern and bushes; why should not all these be cut down and conveyed to the manure yard, where they would soon decay and go in to the general receptacle. At one corner of the pasture there we found a bog hole full of deep black mud, and the borders of which had been enriched for a long time by the droppings of the cattle who had been accustomed to resort there for water. Here, said we to ourselves, at once is an abundant resource, a mine of wealth which cannot be exhausted for years, but which the farmer had hardly dreamt of. As we returned to the road we passed the remains of the carcass of a dead horse and the bones of two or three sheep which had died of neglect and starvation the preceding winter. There they lay bleached by the rains and winds. Why should they not now be collected, broken by a sledge hammer and used upon the land; or rather why should they not at first, immediately after death, have been covered so as to avoid poisoning the air with their offensive odors; and so that ammoniacal gases might have been collected in the soil and thus be saved for the aid of vegetation; and indeed so that the whole mass might be reduced to a condition, in which it would furnish a most enriching manure. In its present condition it was worth nothing. Near the barn at the road side, there was the site of an old house, with the cellar walls remaining, part of the chimney standing, and piles of rubbish, mortar, burnt clay, ashes, chips and innumerable unmentionables, the undisturbed accumulations of years, the growth of the thistles, and hemlock and thorn apple, and barn grass upon which demonstrated the richness which was underneath. Why was all this neglected; and why was this monument of slovenliness and sloppiness suffered to remain there year after year, an

offense to every decent traveller and an inextinguishable disgrace to its owner, who was probably too much in a hurry to get to the stop or the tavern when he went from home, to find time to remove it; and when he returned was not generally in a condition to see whether it was there or not.

We did not go far, when we met the whole troop of bristled and long-sounded quadrupeds of this capital farmer in full chase in the road, running almost as violently as a herd of wild; mother, grandpapa, and as many young ones as stood round the stake of the great English martyr at Smithfield. Here they were, lean and ravenous as wolves. As for any thought of yarding them, luring them, and making each of them pay regularly for his board by the manure which he would make and compound—this was a sort of 'book farming,' which this skillful gentleman utterly disdained. As we came near the house, here was a pile of chips, which had never been used for anything but the lighting of stoves and chimneys, and though at least ten loads of fine manure might have been taken from under them. The front yard too was ornamented with the droppings of the cows, who were accustomed to come almost into the entry of the house to be milked and to lay in the road at night, because it was rather too much trouble to yard them at the barn, as the barbed not only to be taken down but put up again twice a day. In passing round the corner of the house we came near going over shoes in the drainings of the sink, which was pouring out of the house by a short spout directly under the end window, and there they furnished a perfume without charge, excepting now and then a gentle touch of typhus fever, to the inmates; no doubt to those to whom use had rendered them familiar, quite as agreeable as a cologne bottle. Here too in unmeasured profusion lay bones and rags and old hats and chippings of leather and woollen rags and feathers, furnishing a perfect regale to the eye by a sort of charming Mosaic variety. We are not willing, however, to quit the premises of this capital farmer without mentioning an admirable contrivance for cleanliness, for which we should advise him at once to secure a patent right, if it were at all an original invention. He had a pig-stye in which he in the autumn shut up his swine to be fattened after his fashion; and a necessary, which for picturesque effect no doubt, was formed with open boards put in like the slats of a verandah, and for modesty's sake had a door, which was never confined by linges but was made to be placed and replaced by lifting, and secured in the inside by a billet of wood of the size of a city back-log, and the place appeared to be frequented by persons resembling Hogarth's Scotchman, who, poor fellow, supposed the holes were made to put his legs down; but the perfection of the whole arrangement consisted in having both these places fixed directly over a running stream of water, where all impurity was at once carried off and the most delicate nerves could not be offended.

Now such is a picture of the carefulness, economy, and good management in respect to the saving and accumulation of materials for enriching their land, we had almost said of one half the farmers of Massachusetts.—We will not, however, undertake to determine the proportion; but only say, let those whom the coat fits put it on.

H. C.

SPECULATION.

This word has become absolutely odious to almost all the sober and reflecting part of the community, and cannot sound very melodiously in the ears of many, who can lay no claims to being either sober or reflecting. It is no better in general than arrant gambling; and its tendency is to disturb all the common pursuits of fair

trade, and stop the operations of wholesome industry. A man who lives by speculation entirely, is in general living upon the necessities or weaknesses or ignorance or follies or vices of other men. This is a poor trade; and such men are commonly the cause of the community. A man buys a piece of land to-day and sells it to-morrow for twice as much as he gave. The next purchaser gets an advance upon it, and so it passes on through successive hands, without any improvement of any description whatever being made in it. Now who is benefited by such an operation? The community is not, most certainly.

A man buys into some public stock. He to-morrow sells his shares to another man at an advance; and so it goes on, passing through various hands without any change whatever in the property disposed of. Now who is benefited by this operation? Certainly not the community, for not a cent of intrinsic value is added to the property. No stock is created; and no increased value is given to the property in question by the operation, let the transfer of the property pass through over so many hands. But there is a serious injury to the community by all such operations. They excite extravagant expectations. They induce men to desert their farms and their trades, that by some chance adventure they may get rich without the slow processes of frugality and labor. Successful speculations of this nature too often ruin the operator himself, either by inducing him to hazard every thing in a single cast of the die, or hurrying him on in his uncalculated prosperity into deeper kinds of gambling, and too often impelling him into courses of extravagance, luxury, dissipation and profligacy, absolutely ruinous and dreadfully fatal.

H. C.

THRESHING MACHINE.

We have seen a Threshing Machine of an improved construction, designed to be driven by two men, which it is stated will thresh and clean at the same operation, from fifty to seventy-five bushels of grain per day. It is the invention of a Mr Davenport, of Mount Vernon, N. H. Its construction is simple, and it is easily transported in a one horse wagon. We have not seen it in operation; but from inspection there is every reason to believe that it will fulfil its promise. The grain separated from the straw, the straw carried to a convenient distance from the machine, and the grain passes immediately upon the riddles and comes out clean at the bottom. It is easily placed and worked on a barn floor. Its price is sixty-five dollars, and we believe it can be afforded at least fifteen dollars cheaper than that. It is said to have been in operation a year, and is likely to prove of great value to the farmer.

H. C.

SILK REEL.

A silk reel of a simple and beautiful construction, has been made by Dr Deane, of Greenfield, Mass., which at least answers the purpose perfectly well, and we know no higher praise that can be asked for it. It can be made for six or eight dollars, and will not be encumbered with a patent right. We shall in a few days have a model of it in Boston for the gratification of the interested and the curious.

Labor-saving machines are becoming of great importance to the farmer. While almost every thing else is done by machinery, and chickens are hatched in artificial ovens by hundreds per day, it is necessary that the farmer should avail himself of the mechanical powers in nature, to assist and further his operations, if he would not fall altogether in the rear of the other useful arts. The agricultural warehouses and plough manufactories in Boston and Worcester, will show that much has al-

MISCELLANEOUS.

PLEASURE OF PARENTAL AFFECTION.

That man must be unamiable indeed, who does not feel the greatest pleasure and delight in becoming the father of an infant born in holy wedlock. Some there are, however, who know not how to appreciate the blessing which Providence has bestowed upon them; who receive with coldness a son's greeting or a daughter's kiss, who have principle enough to feed, clothe and educate their children, and labor for their provision and support; but possess not the affection which turns duty into delight; who are surrounded with blessings, but know not the art of contracting their exquisite sweets. How different is the effect of the parental love, where nature, duty, habit, and clinging, all combine to constitute an affection the purest, the deepest, the strongest, the most enduring, and the least exacting of any of which the human heart is capable!

The selfish bachelor may shudder when he thinks of the consequences of a family; he may picture to himself hindered time and injured industry, imagine the noise and confusion, the expense and the cares, from which he is luckily free; hug himself in his solitude, and pity his unfortunate neighbor, who has half a dozen pulling children to impoverish and trouble him.

The unfortunate neighbor, however, considers himself much more fortunate than the wretched bachelor; he pities the loneliness of the bachelor's situation, and can never see, without feeling of regret, rooms where no stray plaything tells of the occasional presence of a child, gardens where no little footmarks show that there are living creatures in the house. The parent has listened to his heart, and from it he has learned a precious secret; he can convert noise into harmony, expense into self-gratification, and trouble into amusement; and ceases in one day's intercourse with his family a harvest of love and enjoyment, rich enough to pay years of toil and care. He eagerly listens on the threshold of his door for the boisterous greeting of his little ones, feels refreshed by the patterning sound of their feet as they hurry to receive his kiss, and by a noisy game at rumps with them, drives away the cares and perplexities he has experienced in business, and his intercourse with the world.

Notwithstanding the infinite pains taken to spoil nature's lovely works, there is a principle of resistance which allows of only partial success; and numbers of sweet children exist to delight, and soothe, and divert us, when we are wearied or fretted by grown-up people, and to justify all that has been written or said of the charms of childhood. It is not only to their parents and near connections that children are interesting and delightful, they are general favorites, and their caresses are slighted by none but the strange, the affected, or the mercenary; statesmen have romped with them, orators have told them stories, conquerors have submitted to their blows, judges, divines, and philosophers, have listened to their prattle and joined in their sports. They teach us one blessed, one enviable art—the art of being happy. Kind nature has given to them that useful power of accommodation to circumstances which compensates for many external disadvantages; and it is only by injudicious management on the part of parents or others who have the care of bringing them up, that the art of being happy acquire'd in their infancy, be-

comes lost to them when they arrive at maturity. He must be unamiable, indeed, who can contemplate unmoved, the joys and sports of childhood. But the good and amiable man, the tender and affectionate parent, in witnessing the infant gambols, and observing the gradual opening and expansion of their minds, feels a pleasure and delight which no language can describe, in the contemplation that *he is their father*.—*N. Y. Trib. Sun.*

AN ANECDOTE—TIE AND GOOD.—Governor Chittenden—the first of the name who filled the office of Chief Magistrate of Vermont, had two sons, named Martin and Truman. The first of these was deemed less highly endowed by nature than the other, and a college education was given him to remedy the supposed deficiency. Truman, who never lacked in natural wit, was free of the form. It chanced one day that the Governor had in his barn a calf so little and so feeble with animal instinct, as to be unable to draw sustenance from its mother cow; not all the efforts of the Governor or his help could surmount the difficulty. 'Truman' said his father, 'what shall we do with this feeble calf? How shall we begin him to suckle?' 'I don't know, really, father' returned the son with the most considerable gravity, 'unless you send him to college with Martin.'—*True Gait.*

RECOMMENDATION.—As the season has just arrived for these delicious cakes, we copy the following direction for preparing them, which we find in an exchange paper, for the ladies.

To three parts of buckwheat flour mixed into a batter, add one teaspoonful of carbonate of soda, dissolved in water, and one spoonful of tarted acid—dissolved in like manner; first whip the egg white, stir the latter well, and then put in the acid—this the use of yeast is entirely superseded, and cakes as light as a feather are made. One great advantage is, that the batter is ready for baking as soon as it is made.

A WOMAN IN A THROU—As we were passing down Vine Street, below Town, a few days since, a horse tied to a post and attached to a wagon, became much frightened, reared upon his hind legs, and was about to start off amidst a group of children in the immediate vicinity. A lady seeing the alarm of the animal, and the peril of the children, started forward, seized the reins with both hands and drew him forward with such strength, that the horse was pulled to the earth and overthrown on one side, notwithstanding he made strenuous efforts to break loose, and dragged the female to and fro for several seconds. She retained her hold however, until some men in a neighboring stone-yard came to her assistance; and thus it is probable, that by her presence of mind and nerve, she prevented some serious accident. When the reins were taken out of her hands, she was so exhausted as to be nearly unable to stand. She deserves no little credit, and may well be described as one in a thousand.—*Phila. Inq.*

FARTHY GOOD, WHETHER TRUE OR NOT.—The following is vouch'd for by the Baltimore Courier:—

A Dutchman from the West went to pay His Excellency the President of the United States a visit. He happened to call just as the President and four others were sitting down to dine. The

President had him to be seated, at the same time inquiring if there was any thing new or strange in his country.

"No I think not, except that one of my cows has five calves."

"Ah! indeed—and do they all suck at one time?"

"No sir," replied the Dutchman: "four on 'em suck, while the fifth do her backish on, slushk as I tush."

This was so significant that a clean plate was immediately ordered, and the Dutchman seated at the table, where he partook of a comfortable dinner with His Excellency the President.

WINSHIPS BRIGHTON NURSERY,

AND BOTANIC GREENS.

JOSEPH BRECK & CO., of the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Sedge, they operating on a mechanical principle not before applied, and especially for this purpose. The most prominent feature is, that the application and force of the consequent pressure of the revolving wire.

It is a great reduction of the quantum of power requisite to make, and the strength of a half grown ley is sufficient to work it very efficiently.

As the action is moderate power, it easily cuts two bushels of straw, which will fall twice as fast as has been claimed by any other machine, even when worked by horse or steam power.

3. The knives, owing to the peculiar manner in which they cut, are sharpening less often than those of any other kind.

4. The machine is simple in its construction, made and put to work very readily. It is therefore not so liable as those of the kind to be damaged in general use to get out of order.

WINSHIPS BRIGHTON NURSERY,

AND BOTANIC GREENS.

For sale, Fruit and Ornamental Trees, Shrubs, Creepers, &c., Herbariums, Potationals, Green Houses, &c., &c., Plants, &c.

Orders addressed to Messrs WINSHIP & CO., Brighton, Mass., will be promptly executed, and forwarded to any part of the or other countries.

WAGON POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, at 3 per barrel, Golden Balls.

JOSEPH BRECK & CO.

Fruit and Ornamental Trees, Flowering Shrubs, Plants, &c.

The present being the most favorable season for transplanting trees, shrubs, and plants, we would remind those who are in want of Fruit or Ornamental Trees, Shrubs, Flowering Plants, &c., that we can furnish them at the lowest price at nursery prices, well packed for transportation to any part of the country. JOSEPH BRECK & CO., October 17.

HORSE MULTICAULIS.

6000 Multicaulis, from 2 to 1 foot high, wood well ripened now standing in the field on the Jones' Place in Angell Street, 1/2 a mile from the Providence Market, for sale low (if it can be had) by JOSEPH STETSON, on the premises, or on application to STIMSON & HODGES, Providence, October 21.

PEAR TREES.

For sale at the garden of the subscriber a large collection of Standard and Dwarf Pear Trees comprising most of the choice varieties of European and American origin. Orders by mail will be immediately answered. Goshier to ROBERT MANNING.

DOMESTICATED WILD GESE.

A few pair for sale. Enquire at this office. November 7.

THE NEW ENGLAND FARMER.

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—in those who pay with sixty days from the time of subscription are entitled to a discount of 50 cents.

AGRICULTURAL.

From the Farmer's Monthly Visitor.

INDIAN CORN CROPS.

NEW HAMPSHIRE AGAINST THE UNION.

There cannot be a more desirable climate for vegetable production than one which is adapted to the growth of Indian corn; and the soil on which Indian corn grows will never fail, with a proper application of labor, to produce abundance for man and stock. Now in the production of Indian corn, the soil of New Hampshire will not shrink from a comparison with any other part of the country. The immense crops of corn which have been recently raised in the county of Strafford, in the vicinity of the beautiful Lake Winnipisseege—in Miltonborough, Tuftonborough and Wolfeborough, prising the islands and shore on the north side of the lake, and in Burnstead and Gilmanton, at a miles distance over the Gunstock mountains to south-east of the lake; these crops have been created repeatedly by gentlemen farmers in Massachusetts and other places, as being too great for belief of the credulous. One hundred thirty-three bushels to the single acre, raised if we do not mistake, on the fertile hills of Burnstead, or even a hundred and seven bushels to the acre raised by friend Brown on the Winnipisseege island, too great an amount: it was probably corn in ear—so much shelled corn could not be made row on an acre, said a distinguished agriculturist in conversation with the editor of the Visitor, did not positively contradict him, because we did not say that we had actually seen with our eyes the acre that had yielded so much. But we have now the evidence of a yield of Indian corn raised by Mr Brown the present year, "weighed by a man appointed to measure crops for premiums" in the county of Strafford; and this whole crop of weight of 8051 lbs., measuring the traced corn in ear at 70 lbs. to the bushel, and that which is not traced, at 68 1-4 to the bushel, was *one hundred and sixteen bushels*. If we can believe a interested witness, we must give credit to this amount.

We have heretofore published in the Visitor, under the hand of Mr Brown himself, the manner in which he raises these great crops of corn. Does it by putting upon the land double the quantity of manure, and by bestowing as much labor upon a single acre as is ordinarily bestowed upon two and three acres. The soil upon the islands—not alluvion, but common rocky soil with a hard pan or subsoil, is probably of that on which manure and cultivation will have the greatest effect; the same may be said of most of the swelled hill lands in Meredith, Gilmanton, and other towns in Strafford county.—The result of Mr Brown's experiment proves that corn is more profitably applied by him in the cultivation of his corn field than by farmers generally; his one acre produces a present crop equal to a common crop of three acres; and this crop

leaves the condition of the land such that it will produce, without any further application of manure, at least twice the usual amount of wheat or oats for the first year and of grass afterwards for some five or six subsequent seasons.

Mr Brown's preparation, according to our recollection, is, to take land which had been broken up from the sward and planted once with potatoes, with a first application of some twelve or fifteen loads of coarse manure before planting. After the first crop is taken off, apply twelve or fifteen loads of manure and plough it in deep in the fall. The next spring plough in at a less depth some fifteen to twenty loads more of finer manure. In this way the whole soil for six to ten inches deep is pulverized and feels the effect of the manure. In addition to these advantages, Mr Brown has an excellent kind of corn adapted to a northern climate, which he has been improving for several years, and which will come to maturity in three months from the time of planting. If we could be sure of a season of four months free from frost, there are other larger kinds of corn—the Dutton twelve and sixteen rowed, or the long eight-rowed ear called the Parker corn, for example—that might grow more upon the acre than the Brown corn. But in land prepared as he prepares his, with rows three feet apart, and the hills in the rows placed at the distance of two feet each from the other, and three stalks to the hill—we do not believe there is a kind of corn in the country that will, year in and year out, produce a greater quantity on the same ground. Mr Brown's kind yields larger ears and more in quantity of corn in proportion to the size of the stalk, than any other kind within our observation.

But Mr Brown's crop of one hundred and sixteen bushels to the acre, was not the largest crop of corn raised this year in New Hampshire. The green islands which stud the charming Winnipisseege, bear away the palm for the greatest crops of corn. Mr Robert Lamprey, whose farm is on the same island with Mr Brown's, within the limits of the town of Miltonborough, has raised this year from one acre, *one hundred and thirty-one bushels and seven quarts*, "estimated in the usual way, by measuring all in a basket and shelling one basket full." Some grains of allowance must be made for this mode of measuring, as the persons who harvested the corn would naturally feel an interest to pack the basket to be shelled quite as close as any basket which was not shelled. Mr Paul P. Pillsbury lives on Cow Island, situated in the town of Tuftonborough, some few miles eastward of Long Island on the same lake shore; and his crop of corn, measured in the same way as that of Mr Lamprey, was *one hundred and thirty bushels to the acre*.

Mr Lamprey and Mr Pillsbury have each sent to the editor of the Monthly Visitor a trace of the corn raised on their respective lots: the samples are the most beautiful we have ever seen. Both kinds of corn are in some respects similar, being a mixture resembling partly the Dutton and partly the Brown corn. Mr Lamprey's corn has the nearest resemblance of the Brown kind—the kernels

have a vanished exterior with the same elegant blazed tinge—a part is eight, and a part ten and twelve rowed. The ears are larger than the Brown corn—the kernels are smaller but the cob is larger. In Mr Pillsbury's sample the ears are large but not as long as the other—the color of the corn is a lighter yellow, the kernels something smaller, and the cob larger, especially at the stump end. In both samples the ears of corn are covered to the tips, and there was a beautiful uniformity of kernel from one end of the ear to the other.

The Brown corn, where it has had a fair trial, has fully come up to the expectations of the public. Benaiah Cooke, Esq., editor of the Cheshire Farmer, exhibited a few traces of his corn raised on his premises, at the late agricultural meeting at Keene: all the seed he raised was at once bespoken by the farmers of Cheshire; and so pressing was the demand for this seed, that Mr Cooke at once proceeded personally to Long Island, a distance of nearly one hundred miles, and purchased from Mr Brown himself, all he could spare of his great crop of the present year.

The crop of Brown corn raised this year by the editor of the Monthly Visitor, was as good as any crop we had seen in the vicinity. The ground was as good, nor did it have the advantages of that of Mr Brown. It was a track upon the intervalle bordering upon the Merrimack river, which had been formed, not by a deposit of sediment by the backing up of the raised stream, but by the washing on of sand directly over it. This land had not, until it came into our possession, been considered worth cultivation; two years ago it was covered with bushes, and where the surface was stirred the wind blew the sand over much of it so as to prevent vegetation. Yet on one acre of this land we think was produced full seventy bushels of shelled corn. Of this kind of corn we have saved full fifty bushels of seed. A part of this has been engaged in Boston. Mr Samuel Whitney, living on the premises of the editor, selected from the field about forty bushels of the finest ears of the crop, which have been carefully traced and hung up. Gentlemen who may wish to furnish themselves with this kind of corn, will please to apply to Mr Whitney, who also will have the disposition of a few bushels of Rohan potatoes raised by the editor of the Visitor.

We copy the following from the Cheshire Farmer for October:

"*Brown Corn*.—It will be recollected that we previously have given some account of a kind of corn denominated the "Brown Corn." We procured last spring, one and a half bushel of this corn of Mr Brown, and planted one acre with it, and sold the rest. Our acre did very well, producing, as was judged by many farmers who saw it, not far from forty bushels. As we picked a part of it for seed, and fed out some without measuring, we are not able to give the exact amount, though it would not vary much from 40 bushels. It is a large eight-rowed corn, and very early—a specimen of it may be seen at this office. We exhibited some of

it at the last meeting of the society in this county, and find it took very well with the farmers in this section. We have already had orders for some ten bushels of it for seed.

Concluding that what we raised would go but little way in supplying the demand, and desiring not again to be *traced* with corn, we proceeded personally to the farm of Mr Brown, a distance of 95 miles, examined his field, and purchased such of his corn as he would spare, suitable for seed, which in due time we shall have on hand for the accommodation of farmers in this section.

A few days since we received the following letter from Mr Brown, which we take the liberty to publish.

Moultonboro', (Long Island) Oct 19th, 1839.

B. Cooke, Esq.—Dear Sir—I harvested my corn last week, and I have a fine lot of seed traced in fine order. On account of tracing so much, I could not measure it in the usual way, but had it weighed by the man appointed to measure crops for premiums. The whole crop on the acre, in ears, weighed 845 lbs. We shelled both of the traced and the untraced, to get the amount in bushels—of that which was traced 70 lbs. made a bushel; of that which was not traced 6-3-4 lbs. made a bushel—whole amount 116 bushels. We first went over the piece and selected all that was suitable for seed, which was ever one-half in weight.

Mr Lamprey measured his in the usual way, by measuring all in a basket and shelling one basket full, and had 131 bushels, for which he obtained the first premium. Mr Pilsbury, on Cow Island, measured his in the same way and had 130, and took the second premium, there being but two premiums offered by the society. But the committee on crops, considering the exact manner in which I obtained the measurement, and superior quality of the specimen which I presented, recommended in their report to award me a premium, which was accepted, and I obtained a premium for the *excellence* of my corn. It seemed to be the opinion of many before harvest, that I should have the most on an acre, but the season being more suitable for their ground, it being dryer than mine, partly accounts for the result, and the manner they measured, which cannot be so exact as that of weighing, will also partly account for it. By ploughing in the manure very deep, I did not probably get so much of the strength of it as if the season had been dryer, but I would not discourage the practice of deep ploughing, and well mixing the manure with the soil. I still think it the best way; if some seasons we do not get so much of its strength, we retain the manure and enrich the soil.

I am yours, with respect,

JOHN BROWN, 24.

AGRICULTURAL WAREHOUSES.

One of the great causes which has led to the superiority of English agriculture, is to be found in the establishment of agricultural warehouses, nurseries, seedstores, &c., in all the principal cities and villages of the kingdom, where agricultural implements of the best kinds, seeds and trees of the best quality and varieties can be obtained by all who wish them, at reasonable rates. The establishments of London, and of Knight, in London, and of Lawson and Dickens, in Edinburgh, are celebrated for the extent of their collections, the great amount of business they perform, and the acknowledged benefits they have conferred on the agricul-

tural world. In these warehouses, seedstores and nurseries, may be found ploughs, harrows, rollers, and all the tools and implements required by the farmer and gardener; seeds of the purest and most approved varieties, and fruit and forest trees suitable for every situation. A large proportion of the farmers purchase at these stores their seed wheat, their grass seeds, &c., and by long experience, the proprietors of these establishments, knowing the kind and quality of the soil, can better apportion the kinds and quantity of seed required for such lands than the cultivators themselves. So extensive and necessary have these branches of business become, that in a late number of the London Gardener's Gazette, a list of those the most distinguished are given from the principal cities and towns, amounting to no less than 800.

In the U. States, such establishments could scarcely be less useful than they have proved abroad; yet their number is very limited, compared with what we think the advancement of agriculture, and the benefit of the farmer demand. A few, however, exist, and we hope their success will be such as to cause the establishment of others at all the principal points of our country. If in every principal city or village the farmer could be certain of finding at some store or warehouse, the implements he needs, of the best kinds and quality, he would esteem it a favor, as saving him much trouble in collecting from various places the articles he wants, and so with places for the sale of seeds and trees, which are becoming daily more useful and indispensable.

The agricultural warehouse of Mr Breck,² at Boston, the publisher of the New England Farmer, is one of the most extensive in New England, if not in the United States, and has been found of essential service to the farmers of that region. In the city of New York, a beginning was made some years since by Mr Fleet, then publisher of the New York Farmer, in establishing such a warehouse, and is now carried on with spirit, and we trust success, by J. W. Weaver & Co., 79 Barclay street. With the warehouse is connected a seed establishment, conducted on liberal and honorable principles, and deserving the notice and patronage of the public. At Albany, Mr W. Thorburn (not of Chinese Tree Corn memory) has added the disposal of agricultural implements to his former business as a seedsman, and is doing much to bring within the reach of farmers in that vicinity, the best implements required by the cultivator of the soil. Several minor establishments have also been opened in the State, the business of which is rapidly increasing, and the benefits of which are every year more clearly felt and acknowledged. Among the seed stores of the State, the Rochester one holds a distinguished place for extent and usefulness, and the new arrangements of Mr Batcham will doubtless give it greater efficiency and activity, and conse-

²This warehouse is 90 by 30 feet, and covers a space of 2700 square feet, occupying 5 floors, making 13,500 square feet of flooring—every part of the building being filled to overflowing with the best and most approved kinds of agricultural and horticultural implements, as well as the largest and best assortment of every variety of field, grass, garden and flower seeds to be found in any establishment of the kind in the United States. During the time this establishment has been in existence, (a period of something like 17 years,) no pains have been spared in the improvement of the various departments, in regard to its internal arrangement, quality and superior finish of the tools, excellency of the seeds, &c. J. B.

quently diffuse its benefits more extensively throughout the district.

We always hail the establishment of nurseries of fruit or forest trees, warehouses for the sale of agricultural implements, and seed stores for the dissemination of seeds of good quality, and many varieties, as an omen of good to the country; as a proof that the spirit of inquiry and observation is awake, and that our farmers are beginning to appreciate the difference that exists between implements of the same name, and seeds of the same variety. Good tools and good seeds are indispensable to good farming, and this should be understood and practised upon by the farmer. A choice of seed will not unfrequently make a difference of one-third or even more, in a crop of wheat or corn; and in nothing do farmers err more frequently than in sowing an impure, heterogeneous mass called grass seeds, but in reality made up of all manner of seed stuff for grass seed, thus propagating and perpetuating various nuisances on their farms. We say, let warehouses and seed stores be well patronized so long as they furnish good tools and pure seeds. The country reaps the benefit.—*Genesee Farmer.*

SOAP MAKING.

Much difficulty is often experienced by those who manufacture their own soap; frequently indeed the operation succeeds well, but sometimes totally fails from unknown causes. Often every precaution has been apparently taken, complete failure has been the consequence; and at times is not long past, when some have even declared that they believed their soap was *bewitched*. If the rationale on which the process is founded, but understood, the whole becomes simple and easy, and may be performed with an absolute certainty of success.

Common soft soap is composed of oil (or fat), and potash. The potash is obtained from common wood ashes, by causing water to run through which dissolves the potash contained in the ash and leaves the residue behind. The manner in which the oil or grease is obtained is well known. These are made to unite and form soap by being boiled and well stirred together.

One of the first requisites in soap making is that there should be a sufficient quantity of potash dissolved in the water, or in other words, that the solution should be *strong*: this is readily ascertained by egg; if the egg floats the ley is sufficiently strong; if it sinks, it is too weak, and must be increased in strength by evaporating a part of the water by boiling, or by passing it again through ashes.

But it not unfrequently happens that the ley found by trial to be too strong, and yet good soap cannot be produced. This is almost always owing to the potash of the ley not being *caustic*, or capable of corroding the skin, which state is absolutely requisite to success. Potash in its parent state is highly caustic; but when ashes have been some time exposed to the air, they gradually sorb from it a portion of the peculiar kind of existing in small proportion in it, known by the name of *carbonic acid*, which destroys the caustic properties of the potash, and renders it unfit for the manufacture of soap. Now, as quick lime has a stronger attraction for carbonic acid than potash, it is only necessary to place a quantity of lime in the proportion of half a bushel of lime for a head of good ashes, in the bottom of the leecher before filling it, and it will abstract the carbonic

on the potash of the ley, as it passes downward, giving it in a comparatively pure and caustic state.

In order to prevent failure, therefore, this should always be done. In order to ascertain if ley contains carbonic acid, pour a few drops of sulphuric nitric acid into a wine glass of the ley, when it contains much, a violent effervescence (or boiling up of bubbles) will instantly take place, owing to the escape of the carbonic acid. The carbonic acid may be removed from the ley and render it fit for soap making, by boiling the ley with quick lime.

If the ley be strong, if it be rendered caustic, and if there be a sufficient quantity of tolerably an fat, there can be little danger of success.—The proportions should be about thirty pounds of ley to eight or ten gallons of ley.

Hard Soap consists of soda instead of potash, used with fat; and is commonly made by adding tannin salt (which consists of muriatic acid and soda) to well made soft soap while it is yet boiling. The soda of the salt unites with the fat, and forms hard soap, while the potash unites with the muriatic acid of the salt and separates by falling to the bottom of the vessel. Different degrees of hardness in soap are obtained by using potash and soda, at the same time in different proportions.—Since grease from salt meat has a tendency to increase the hardness of soap, unless the salt be previously removed by boiling in water.

Soap of tallow is made in England, and largely in the United States, and is the best in common use; when scented with oil of caraway seeds and set into a mould, it is used for the toilette, and is called Windsor soap. Other toilette soaps are made with butter, hog's lard, or with almond, nut palm oil. Sometimes fish oil is used for coarse soaps, as well as linseed oil; and rosin is often added to give a yellow color and odor. The following proportions (by weight) have been given for a good yellow soap: tallow twenty-five, oil four and half, rosin seven, barilla, (soda) eighteen, settlings waste ley, evaporated and calcined, ten, and lin oil one-half part.

Soaps are colored blue by indigo, yellow by turmeric, &c.; and marble or veined soaps are made as: to the soap just separated from the spent ley, wley is added, and then copperas dissolved in water; red oxide of iron (or colcothar), mixed with starch is stirred in by manual dexterity, and is so used as to produce the peculiar appearance.—*Vermont Farmer.*

HAPPY CONDITION OF THE NEW ENGLAND FARMER.—The condition of a community situated as is the great mass of agriculturists in New England, is more desirable than that of any other class of men within my knowledge. If it do not attract men and women to this life—if it do not make them happy as to increase the love of life beyond the rage of sorrow, toil and pain—it is a condition which he "tall, the wise and reverend head" may envy, living within their own means, on the fruits of their own labor—enjoying abundance of the best products of the ground and the first fattings of the flocks; the appetite sharpened and sweetened; the muscular powers strengthened; the mind made vigorous and active by labor; their dependence solely on the goodness of God; their prudence having looked forward even to the destruction of a crop with a providence to supply its place: with abundant leisure for all healthy recreation and all peaceful rest; with no worldly cares and vexations

encroaching on the reflection which aids the better judgment; in the midst of those social and domestic relations which throw a charm about life—which give to moral snasion its greatest force, and which rear the tender thought to the ripe vigor of its highest usefulness,—how can we conceive any state of imperfect, erring, dependent man more truly enviable than that of the industrious, laboring, prolific farmers of New England, who live according to the best lights of their own experience? The merchant fails nine times in ten before a fortune is gained—the speculator ninety-nine times in a hundred; the mechanic and the lawyer gain only while their work is going on; the wages of the priest, like those of the common laborer, stop when he no longer works; the physician adds to his income no oftener than he visits the sick; the salary man, if he saves at all, saves only a specific sum;—the farmer, more sure of success than either, in nine cases out of ten, certain of ultimate prosperity, lays his head upon his pillow with the reflection that while he sleeps his crops are increasing to maturity and his flocks and herds growing in size and strength.—*Gov. Hill's Address at Keene.*

MAN'S NECESSITY HIS GREATEST TEMPORAL BLESSING.—For her physical and moral progression, for her increased means and wealth, and the excellent habits of her population, New England is not less indebted to the roughness and sterility of her soil than to the obstinate morals and unremitting perseverance of her original proprietors. * * * The great blessing of New England has been her hard soil, her difficulty of producing abundant products from the earth, and the necessity to labor which has pervaded almost every rank and class of her population. If a part, say one-half, could have done the work necessary to support all, then might we see at this moment a race of different color, with marks of inferiority, doing what is now done by nearly the whole superior class combined: then might we witness one class of our population physically and morally enervated—another class to the lowest pitch degraded. Slavery existed in New England before the existence of those blessed free institutions which were purchased at the expense of the blood of freemen. A race was here as "hewers of wood and drawers of water"—a black race in slavery, scattered remnants of which in some parts remain: and to no single cause so much as to the necessity that all should work to gain a competence from the ground, is it due that free white labor, diffusing the blessings of health and abundance, is the almost exclusive labor of this portion of the United States.

We cannot always have that exact state of things which all could wish. For wise and beneficent purposes, the Almighty has placed us in a state of trial and uncertainty. The fruits of well directed labor are sometimes smitten—the struggles of hard labor are sometimes crowned with utter want of success. The privations and the sufferings of the first New England settlers were far beyond the privations and sufferings of those who are now settling the new territories of the South and West. The progress of those first settlers was much slower and more tedious—the dangers and horrors of savage warfare were much more appalling—the destitution of the common necessities and comforts of life was more intense and more general. If the savage tomahawk now and then does the work of sudden murder upon our extreme frontier, the opportunity of protection or escape to those who re-

main is soon presented. To the settlers of New England for the first hundred and fifty years, not only the frequent terrors of repeated barbarian murders in the worst shape were realized, but a heartless, hopeless, never-ending fear of secret attack and massacre became the great passion, swallowing up and marring almost every species of enjoyment.

Our fathers, doomed to procure sustenance by the severest sweat of the face, the charged musket was taken to the field for defence. With every precaution, the watchful and prayerful pioneer, while cutting down the forest or tilling or gathering the fruits of the ground, was frequently shot down in the field by the Indian lurking unseen in some adjacent swamp or covert: the brains of children were dashed out in the presence of trembling mothers, torn and hurried into captivity ere the bleeding victims had ceased to struggle. The accumulated horrors of want and famine and pestilence, were but a mitigation of the greater horrors and dread of savage warfare. Within my own recollection, aged men and women lived among our ancestors, who, from their remembrance of these horrors, described their own condition with their elders, concerned for themselves as well as for their protection, in language and gestures with colors that no hieroglyphic or written or printed statement ever can equal.—*Ibid.*

BENEFITS OF ROOT CULTIVATION.—The culture of root crops for the rearing of swine and for winter feeding of cattle I believe to be a great object to most farmers. The mangel wurtzel, the sugar beet, the common beet, the carrot and perhaps the parsnip may be raised on ground that will produce a good crop of corn; the ruta baga may be raised on a lighter soil and with less manure than the other crops. In proportion to the quantity produced with the same labor, I am inclined to give the preference to the ruta baga. That crop may be raised with about as little labor as a crop of potatoes upon the same ground. If the season be fortunate, six and eight hundred and sometimes a thousand bushels to the acre are produced: a thousand bushels weighing twenty-five tons, dealt out to a stock of cattle, will be equal in value to at least ten tons of the best hay. It is a mistake to suppose that the ruta baga spoils either the meat or the milk of the creature fed upon it. This mistake originated in the fact familiar to many practical farmers, that the turning of fat cattle and cows into fresh feed, where turnips, cabbages, and onions have been raised and cleared out, leaving tops and leaves, will make them liable when slaughtered or milked, to leave the meat or the milk tainted with the taste and flavor of the articles upon which they have fed.

Milch cows fed daily on ruta baga once a day, will communicate no taste to the milk: and if there be any doubt about fat cattle, the leaving off the ruta baga one week and substituting corn or other feed, will leave their meat in as good flavor and quality as if they had fed exclusively on corn. I prefer late sowing of ruta baga, say as late as the 10th of June, to an earlier day: this root grows best in cool weather, and by late sowing it much better escapes the turnip fly and destroying grubs, and has the advantage of a vigorous growth late in the fall until severe frosts shall render it a matter of prudence to sever them. Beets of the various kinds, and carrots, to such as do not admire ruta baga, may be made well to supply their place. Fed with either, winter milked cows may be made to give double the quantity of that most necessary and

most grateful article in the consumption of every family, that they will give when fed simply on the best English hay. With the general cultivation of roots, my present conviction is that the quantity of beef and pork and butter and cheese produced in New England, may be increased one-half, and might be very easily doubled.—*Ibid.*

From the New York Observer.

DR. HUMPHREY'S THOUGHTS ON EDUCATION.

Qualifications of Teachers.

I have already said that a school-master ought to be a man of *good common sense*.

My second remark is that he ought to be *well educated*. How can he instruct others in what he has never thoroughly learned himself? All the good sense in the world, essential as this qualification is, would not fit him for the teacher's chair without a familiar acquaintance with the studies of the school. I say a *familiar* acquaintance, because if he cannot hear a class read without looking over every moment, or correct bad spelling in a composition without fumbling in the dictionary, or write a letter himself without making a dozen mistakes in orthography and the placing of capitals; if he knows so little of figures, as to be hindered and puzzled every time a slate is handed to him by a bewildered novice, and has so little knowledge of grammar as to boggle and blunder in the easiest lessons, he is not fit for a school-master, whatever else he might do. If he would keep the school "for nothing and find himself," no district could afford to employ him. Children's time is infinitely too precious to be wasted under the care of a master who is not half educated himself in the very branches he is required to teach. And besides the loss of the winter, bad habits of spelling, reading, writing, and the like, are inevitably contracted, under an incompetent master, which it will take another winter to correct. To manage and instruct a school well, a teacher must see things at a glance, and must be able to correct mistakes at the instant. He has no time to study the lessons in school, and very little out of school. He must come with a well furnished mind, or else with all possible efforts to make up the deficiency as he goes along, he cannot meet the reasonable expectations of his employers. And it makes but little difference how much he knows in the higher branches of education, if he is ignorant of the elementary principles, or if they are not quite familiar to his mind. He may even be able to construe Greek and Latin with considerable accuracy, and yet be miserably deficient in some of the commonest branches of an English education. In such cases a parent may be assured for his comfort, when he complains of his children's not being taught correctly in the common school, that the master has been half through college; but the evil is none the less for that. A child may just as well be badly taught by an ignoramus as by a graduate.

Have you then taken time and pains to qualify yourself for the highly responsible duties of a teacher? Can you read—can you spell—do you understand the powers of the letters—what do you know about accent, emphasis and cadence? Can you write—and do you know how to make and hold a pen—are you quick in figures and prompt in grammar, geography? &c. &c. In one word, are all these qualifications at "your fingers' ends"? If

not, let me advise you as a friend—I mean a friend not only to yourself, but to every body who wants a good school-teacher, not to undertake at present.—Perhaps you can earn as much some other way. But if you think you should be fond of teaching, first prepare for it. Apply yourself diligently to study; and as soon as you can get ready, present yourself to the examining committee, but not before.

A *third* essential qualification in a school-master is *aptness to teach*. However well he may understand the theory, and however affluent he may be in all needful attainments, if he lacks the gift of *communication*, he can never be a useful teacher. The knowledge is hid treasure, a sealed fountain, which may be a source of high enjoyment to the possessor, but can be of no advantage to the pupils. No one, I am aware, can certainly tell whether he possesses the faculty of teaching. Or if he does, with what success he can cultivate it, till he has a fair opportunity to make the trial. It would be unkind and extremely unfair, therefore, to say to a young teacher, you never ought to have entered a school, for it is as clear the sun, that you have no talent for the business. And so it may be *now*; but how could he know whether he had a tact or not, till he tried? If having signally failed, he persists in offering himself as a teacher, rebuke him, or what is still better, protect yourselves and your children by declining to employ him.

A *fourth* qualification, of great importance in a school-master, is *calm self control*. The temperament of some persons is altogether too mercurial for the school-room. They do well in smooth water, but make miserable steerage in rough weather. Every cross wind makes them lose their reckoning. Every little annoyance, every little jostling, disturbs and excites them. They begin to chafe and storm ere the first ounce of patience should be exhausted. So ticklish are their nerves, that they cannot bear one atom of friction. They want to have every boy sit up as straight as a candle, and be as still as a mill-stone and as mute as a pickarel. When every thing does not go exactly right, in a cold morning, it frets them exceedingly; and it requires but little provocation to throw them quite off their guard. And then they are sure to say or do something which they will be sorry for the next moment; and which hardly ever fails to lower them in the estimation of their scholars. In short, they have no self-control, which is too nearly synonymous with having no proper *self-respect*.

Now whatever else such a man may undertake, he ought never to think of keeping school. *Nerves*, in this case, is a very different thing from *nerve*.—The former he *must* have, or he will not succeed; but the latter of the latter he carries about him the better for himself and for all concerned. I will not say, that it requires the patience of Job to teach and manage a large school, because his trials were of a very different kind; but it certainly does require a great deal of patience. A teacher has so many different tempers, intellects and habits to deal with; so many questions to answer at the same moment; so many pens to make and mend; so many classes to hear; so many sums to look over and correct; and so many rogues to watch, that he must have a good deal of self-discipline to keep perfectly cool and steady through it all, when he has sixty, or seventy, or even thirty scholars; and is shut up with them six or seven hours a day, with the thermometer sometimes at blood-heat, and sometimes nearly down to zero. But I repeat the

remark already made, that no one can be duly and properly qualified to keep school, without patience and self-control. I know not how many candidates may be set aside by the application of this rule, nor do I feel answerable for it, however much the number of teachers may be reduced. It is wrong that our schools should suffer for the sake of giving employment to persons of such irritable temper and habits, as must inevitably neutralize all the good qualities, and greatly injure the tempers of our children. And who, allow me to ask, has not known some individuals of good abilities in the chair of instruction, as well as elsewhere, answering to the description which I have now given.

To be continued.

"THE DEBT-PAYING NATION."

This is the name which the United States have acquired abroad, and never was an appellation better deserved. We, as a nation, run in debt more than others, than perhaps all other nations put together. What would be said if Great Britain should run in debt two hundred millions to France, or Prussia fifty millions to Austria? We, on the contrary, thirty millions of selling our credit to the amount of hundred or two of millions, in the shape of stocks and then purchase goods annually to the amount of some twenty millions more than we can pay at the time, trusting to luck, and tempting Providence. It requires no prophetic sagacity to foretell that matters cannot always go on at this rate. Our credit must be over-taxed in time, and though our resources are immense, a sudden invitation to "char over," would produce a convulsion, of which we will remember 1837, may form a faint conception; convulsion in which the credit and the floating capital of the country would alike go to ruin. The individual is on the high road to bankruptcy, whose average expense exceeds his annual income, as the same is equally true of nations. How stands the matter with us in this respect?

In 1837 we imported in flour and wheat	\$4,276,776
In the same time we exported of the same	3,075,475
Leaving a balance against us of	\$1,201,201 for bread.
In 1837 we imported of sugar	\$7,205,904
And we exported	76,151
Leaving against us a balance of	\$7,129,753 for sugar.
In 1837 the whole of our imports was	\$140,989,217
And the sum total of our exports was	117,419,276
Leaving against us a balance of	\$23,569,941

But it will be said, this balance is paid, and the debt cancelled. So it is—but how? By transferring the account from the individuals who contracted it, to the country itself. In other words, this twenty-three millions and many more similar balances of trade against us, have been paid in stocks, or the credit of the States has been loaned to secure the foreign dealer. These balances of trade against us are not paid, and when they will

be, if we continue to buy much and sell little, is beginning to be a serious question. We are in a fair way to have a national debt accumulated upon us equal to that of Great Britain: a debt, to pay the interest of which is now weighing her agriculturists and manufacturers to the dust. The only difference will be, her indebtedness is to her own citizens: ours will be to foreigners, and a fearful power it will be for them to wield over us.

How shall this alarming evil be remedied? It would be easy to say, retrench, buy less and sell more. But such is not usually the course of individuals or nations. We have gratified our wants until they have become so interwoven with our system, that retrenchment in the means of satisfying them is not likely to be a favorite doctrine, however just and feasible it may be. The only way, then, for us, if we will have just so much, is *rather to produce the things themselves, or something that will pay for them.* We can raise our own bread, and have a large surplus to sell. We can make all the sugar emanated in the country, and we must do it. We can make the silk wanted in the United States, and if we are wise, we shall soon do it, and put a stop to the largest item in the balance against us; an item of from fifteen to twenty millions annually. Supply ourselves with these three items, and we turn the balance of trade in our favor, and bring the world in debt to us. In that case we should become a debt-receiving instead of a "debt-paying nation," and the difference there is between the actual pleasure of these two operations, (to say nothing of the profit,) will be appreciated by most.—*Genesee Farmer.*

WHEAT ON CLOVER, AND LIMING.

To the Editor of the Farmer's Register:

Norfolk county, (Va.) July 23d, 1839.

I am now getting out my little crop of wheat, and have already cleaned out 118 bushels, and feel confident of 30 to 40 more, which, by the way, is a great crop for this section of country, especially from seven acres of land. Last year I produced from a small piece of land not exceeding four and a half acres, sown with five and a half bushels of seed exactly, ninetytwo and a half bushels of good clean wheat. In sheer justice, however, to you and your works, I must say that the most credit (if there be any,) is due to you and them, especially to your work on calcareous manures. After reading and studying that and some of your first numbers of the Register, I was satisfied that by lime I could make clover, with a little farm-pen manure in addition; and from information derived from various sources, I learned that the practice of the best wheat farmers in this country and Europe was, to sow wheat on a clover ley; I have pursued it so far on a small scale, with complete success. For I am confident from some few previous trials, without the aid of lime and clover, the two crops I have mentioned would not have turned out more than one-third or one-fourth as much as they have now done, all other things being equal. So much for my little wheat crops, which I have not detailed in minutia. Our prospect of a good corn crop thus far is promising. In conclusion I do conscientiously and firmly believe that the easiest, cheapest and best manner or method of improving our lands, is by the aid of calcareous manures, when done judiciously.

R. W. SILVESTER.

The Practical Farmer names 118 cocooneries in operation in the United States.

TO FATTEN POULTRY.

An experiment has lately been tried of feeding geese with turnips cut in small pieces like dice, but less in size, and put into a trough of water; with this food alone, the effect was that six geese, each when lean weighing only nine lbs., actually gained twenty lbs. each in about three weeks fattening.

Malt is an excellent food for geese and turkeys; grains are preferred for the sake of economy, unless for immediate and rapid fattening; the grains should be boiled afresh.

Other cheap articles for fattening are oatmeal and treacle; barley-meal and milk; boiled oats and ground malt.

Corn before being given to fowls, should always be crushed and soaked in water. The food will thus go further, and it will help digestion. Hens fed thus have been known to lay during the whole of the winter months.—*Maine Farmer.*

POULTRY.

The rearing of poultry, by which we here intend the common domestic fowls, requires some care and attention, but the increased profits are usually an ample compensation for any extra expense the farmer is put to on their account. Fowls, wherever they are kept, require fresh air; yards sufficiently large to admit of the exercise of their active rambling propensities to some extent; food in sufficient quantities, and of good quality; a supply of earth, fine pebbles, &c., in which they can dust themselves, and the pebbles of which they can swallow to aid in digesting their food; a roosting place several feet from the ground, and carefully inclosed, so that their nocturnal enemies, such as the owl, skunk, weasel, &c. cannot conveniently get at them; and they should also be provided with a loft containing boxes, straw, &c. for nests. Fowls love to be tempted to lay, by having all the accommodations present, and the more secure from disturbance the better it will be for them. In making a roosting place, it should be recollected that fowls never choose a flat surface to roost upon, but one that is round, and of such a size as to be conveniently embraced by the toes of the foot. This is necessary for their ease in sleeping, for such is the peculiar muscular construction of a bird's leg, that the more the body presses upon it like a dead weight, as it always does in sleeping, the firmer the foot grasps the object it is placed upon. Some fowls cannot be induced to roost under cover, as the peacock and guinea hen, which prefer high trees or buildings; and all prefer a greater or less elevation from the earth. In the winter, fowls suffer much from cold, and they should be furnished with a house or roosting place made so tight as to prevent the injurious effects of cold as far as may be. They should also be well fed at such seasons, and prevented from rambling about in the snow. Fowls fed well through the winter, and provided with warm houses and roosting places, will not cease laying eggs for any considerable time in the whole year. They are also ready for the cook whenever desired; which is more than can be said of multitudes of fowls that find their way to our markets at all seasons of the year. The eggs of a well fed fowl are far better and richer than those from a half starved one, so that in every respect the farmer is benefited by giving to his fowls some of the attention and food he is apt to reserve for his other animals.—*Genesee Farmer.*

[Communicated.]

POSSERS INODORES.

From no motive but a desire to promote the general health, comfort and convenience, I would call attention to the enormous nuisance of *posers* as now constructed and managed. The unwholesome exhalation, the daily annoyance, the occasional horrid accident, are enough to suggest inquiry whether a remedy of the evil cannot be devised. We can scarcely dig a well because our whole peninsula has become a great filter for that which is hateful here, but capable of becoming precious elsewhere.

A complete remedy has been provided to our land. The French have what they call the *fosser inodores*. A strong and tight wooden butt is placed in a corner or small cell of a cellar, with a convenient access from without. A funnel or large tube (common if desired to every floor of the dwelling,) communicates between the closet and the butt, having valves, which prevent the escape of gases. Periodically the butt is removed by a moveable window, and carted into the country without offence to any party and without danger or night work to the laborers. Another butt takes the place of the one removed.

If there were no other advantage attending this arrangement than the suppression of those odious *nightly processions*, it would be worth a while to adopt it. The loss to the agricultural wealth of the neighborhoods of large places by the waste of saline liquids, is incalculable. But this or any other result of our bad economy in this particular, is not to be mentioned in the same month with the severe and unhealthy labor, and (*horrendum dictu*.) occasional suffocation of the men engaged in the service of depletion.

HUMANITAS.

VEGETATIVE POWERS OF SEA SAND.

A few days since a quantity of sea sand was carried out of Morecambe Bay, about a mile from the Furness shore. It had been, less than an hour previously, covered a considerable depth by the tide, and contained several cockles and other shell fish. It was immediately placed in pits or beds fifteen inches deep, and sown, without manure or admixture of any kind, with wheat, barley, peas, mustard and radish seed. In five days the mustard and radish seed had sprouted and begun to vegetate, having thrown out a considerable length of root, while (what is most extraordinary,) the shell fish were even then alive! Should, any one be at all incredulous as to the truth of this statement, he can easily try the experiment himself: an ordinary flower pot filled with sea sand, sown with almost any kind of seeds, would at once put the matter to the test. The farmers all around the bay of Morecambe, in forming composts for their wheat and barley crops, use of sea sand about 26 carts (small one-horse carts), lime, about four carts; manure, ten carts per statute acre. Why use so great a quantity of sea sand if it does not possess very considerable vegetative power?—*English pap.*

When you have finished a job of ploughing and your plough is to be idle a few days, or weeks, do not leave it exposed to the weather, but put it under shelter without delay. By doing this, you prevent a covering of rust, which will require half a day's work to wear off. The same may be said of other implements, as hoes, scythes, axes, &c. They should always, when not in use, be under cover.—*Genesee Far.*

NEW ENGLAND FARMER,

AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, DECEMBER 4, 1839.

The subjoined agreeable and popular letter is from an esteemed correspondent, whom we take pleasure in so shall hold to his word. He cannot let us hear from him too often. H. C.

MR COLMAN—Dear Sir—Whilst abroad I remarked one trait in the rural population of Europe, which I wish were to be equally remarked of our own countrymen—the little attention they pay to rain whilst engaged in their agricultural labors. In a book in your library it is remarked by the author that his farm servants lost but thirteen days in two years from wet weather. I never could remark that they paid any more regard to rain than young ducks would. It is true that there it seldom falls in torrents as it does here—rain then descending in mists, or what we term "drizzle." And yet you will seldom see American laborers continue in the field even when the weather is as moist as that. The distant appearance of a shower drives them under a cover. In England they brave the greatest storm, and plough in the face of a Northeaster that makes all rattle again.

I have some considerable acquaintance with the manners and customs of the English peasantry, having spent a long time amongst them, and being fond of mixing with them—with being both "among them and of them." They are a jovial set of fellows—Jack tars without salt water: as lively as the lads of the sea, and enjoying the alehouse as well as Jack does the forecastle. After a day of hard toil they congregate in the village tap-rooms like Shylock's merchants on the Kialto: pipes are called for, and there is the music of empty flasks, and the amatory strains of the rustic beaux resounding through the village. Jovial fellows they are, upon whom labor sits as light as thistle down.

I have compared the American with the English laborer, and am convinced that whilst the former will do in any day in which he labors the whole day, one-quarter part more than the latter, the latter actually does twice as much work in a year. The incessant plodding which gains riches—the unwearied labor which removes mountains—the continual dropping which wears away a stone, belong to the English laborer in a greater degree than to the laborer of any other nation with which I am acquainted except the Dutch. It is absolutely astonishing to see the rapidity with which an hundred acres of grain disappear before a few apparent stoggers engaged in harvesting it. But from sunrise till sunset they are continually moving—its regular as clock-work, and with as few intervals of rest.

One of the habits of the English peasantry most deserving of commendation, is that of ornamenting their gardens and cottage grounds with flowers and shrubs. I observed it in every part of England, though I think that the peasants of South Devon possessed this simple yet elegant art in the greatest perfection. The honeysuckle and woodbine creep over the grey thatch of their cottages in a manner that enchants him who has an eye for the quiet beauty of rural scenes. It was in one of those green lanes that I saw what will be ever present to the mind's eye whilst memory lives to supply it with incidents. A snug cottage with a laurel hedge and a low border of box within, a few raspberry bushes, laburnum creeping over this pretty abode of love and happiness, and on a little plat of grass in front, three or four sweet cherubs with yellow ringlets, romping with the beloved old house dog. I was, my dear sir, occasional-

ly a visitor at the houses of greater folks, but I enjoyed with more true pleasure, I remember with greater satisfaction, the hour's stroll, the twenty minutes' chat of a September in Devonshire and a summer in Surry.

He who would return to his native land well pleased with Englishmen generally, should visit most in the middle classes, and study more particularly the manners of the better class of peasantry. In high life, as it is called, manners are more artificial, and since to be what a poor man cannot afford to be, is a distinguishing sign of fashion and exclusivism, high ton takes up those virtues which the poor man dare not adopt. Hence there is less domestic virtue in the upper classes than in the lower. On the continent it is somewhat different—the peasantry being more gross, rude, illiterate, and vicious than the circle of nobility and talent.

I shall, if you please, trouble you with some further European reminiscences, by and by—

When the falling stars are shooting
And the scolded owls are hooting,
And the silent leaves are still
In the shadow of the hill,
And the ox is at his rack,
And the hen is safely back,
With old Dobbin from the mill!

In plain prose, when long winter evenings arrive I shall take up my pen again. Yours, I. A. J.

P. S.—The first four lines of the poetry are Byron's; the other three my own. I think mine are the best.—That last line is "supernaturally fine," as they say in Kentucky.

AGRICULTURE IN EUROPE.

Agriculture in Europe is now receiving an attention which it has never received in any preceding time. The long continuance of peace among the great nations, who for so many years, we had almost said centuries, had time to think of little else than conquest and military glory, has been in the highest measure favorable to the cultivation of the common and practical arts of life, and of agriculture in an especial manner, as the great art involving and demanding the aid of all others. Implements of husbandry have been substituted for weapons of war; and fields that have been watered by the blood and whitened with the bones of slaughtered thousands, are now seen glistening and waving with golden harvests.

In England, great as the improvements were before that time, yet within the last fifteen years it is confidently stated, that by an improved cultivation, the agricultural products have increased at least twenty-five per cent. in many parts of that country: that is to say, the amount of crop on the same extent of land is greatly increased, and the expenses of cultivation either not increased or diminished; or, to state in a form perhaps more intelligible, the profits of agriculture are advanced one-quarter by improved cultivation.

The same results are appearing in France. In England the introduction of the turnip husbandry produced the most extraordinary results; and of a permanent character. It enabled the farmers to keep much more stock than could be kept on dry hay and straw, and to keep a superior stock and in much better condition. It enabled them to enrich their lands very greatly by feeding off the turnips on the ground on which they were grown, and served to increase their manure heaps at the barn, when the turnips were fed to the cattle in the yard. The careful cultivation which good crops of this root demanded, made a fine preparation for wheat or oats or barley; and thus every thing went forward by a joint and reciprocal operation. In many of the counties of England the turnip cultivation has been the foundation of their improved husbandry; has changed the

whole aspect of things; more than trebled or quadrupled in many cases the value of estates, as appears by their increased rental, and by the grain and wool, and beef and mutton which it has enabled the farmers to produce, it has proved the source of immense wealth.

What the turnip husbandry has done for England the sugar beet cultivation is now doing for France: with this superior advantage, that the sugar obtained must be considered as, to a degree, an extra profit. The leaves and the pumice afford a large amount of feed for stock; the cultivation which the plant requires, prepares in a capital manner, the ground for other crops; and the increase of live stock on the farm, where plenty of feed is produced in order to keep them, carries every thing else forward in a rapid ratio. The sugar obtained from the root affords a most ample profit, were there nothing else obtained from the cultivation.

The agricultural publications now going on in France, of which we have received several of a most valuable character, indicate an extraordinary attention to this great subject and a high degree of improvement.

In reference to the manufacture of sugar from beet, we learn that so far as cheapness of operation and amount obtained per centage, the business was never more prosperous. The improvements which have taken place within a few years, are very great. The beet is now operated upon by rasping or grating as soon as taken from the field; and this often early in September. It is then leached, if the expression be proper, by cold water. This carries down all the saccharine matter, leaving behind all the mucilage, which has given to the sugar an unpleasant taste; and to get rid of which has long been a great desideratum. The saccharine matter is then subjected to a process of purification, crystallization and refinement, which enables them to obtain at least eight per cent of sugar and at so moderate a rate that they can afford to pay the government excise of seven cents per pound and leave a handsome profit to the farmer and manufacturer. From all that can be learnt, there is little doubt that the improvements are such that it can soon be made an article of profitable household manufacture. This is a great desideratum, and a point which we confidently believed at one time had been gained by our respected friend at Stoneham; but in the absence of all advices from him, we are gratified with this intelligence from abroad, which we have received from an authentic source, and have only to congratulate ourselves that in spite of all delays and hindrances the world will go round. This intelligence is highly gratifying. Europe now is only half a month's journey, and a quickened enterprise and public spirit diffuse intelligence almost with the rapidity of light.

H. C.

THE CULTIVATOR'S ALMANAC and Cabinet of Agricultural Knowledge for the year 1840. By Wm. Buckminster.

This is beyond question, for the purpose intended, the best Almanac that has ever come under our notice. The Farmer's Almanac, so called, which, for the want of a better publication of the kind, has been so many years patronised among us, is a very inferior publication and always abounding in misettable trash of a low description intermixed with some useful matter. What go under the name of the Comic Almanacs are in general infamous for their vulgarity, indecency and baldness; and it is surprising that respectable people will sell them, and still more that decent people will buy them or permit them to be brought into their premises.

The Cultivator's Almanac is, so far as we have seen, unexceptionable as a useful family almanac. It contains the usual astronomical calculations, the accuracy of which

If you have been rightly informed of their source, may be depended on; and subjoined to them is a considerable amount of valuable agricultural reading, of a practical character, for every month. We may not agree in all the opinions advanced, but that neither proves their truth or error, their propriety or inexpediency. They will lead to inquiry, observation and experiment, and we leave to every man the honest exercise of his own judgment. We wish the book entire success. H. C.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Nov. 30, 1830.

The President of the Society exhibited St Germain, Eastern Beurre, Turkish Bon Chretien; and another variety of Peas, name unknown—all grown by a friend of his. For the Committee,

E. M. RICHARDS.

James L. L. F. Warren, Brighton, exhibited a basket of Tomatoes. He has gathered one bushel the present week. For the Committee,

E. M. R.

MASS. HORTICULTURAL SOCIETY.

The members are notified that a stated meeting will be held at their rooms, No. 23 Tremont Row, on Saturday, the 7th inst. at 11 o'clock, A. M.

E. M. RICHARDS, Rec. Sec.

December 4th, 1839.

BRIGHTON MARKET.—MONDAY, DEC. 2, 1839.

Reported for the New England Farmer.

At Market 1150 Beef Cattle, 420 Stores, 1075 Sheep and 415 Swine.

PRICES.—Beef Cattle.—Last week's prices for a like quality were not sustained. A few choice cattle were probably sold at a price something above our highest quotations. We quote First quality, \$6 75. Second quality, \$6 00 a \$6 50. Third quality, \$4 50 a \$5 50.

Barrelling Cattle.—Several lots were sold. Mess \$5 50; No. 1 \$5 00.

Stores.—Yearlings \$9 n \$12. Two Year Old \$15 a \$26.

Sheep.—Lots at \$1 50, \$1 88, \$2 12, and \$2 50.

Swine.—Several small lots to close were sold at 3 and 3 1/2. One at 4 and one at 4 1/2. At retail 4 1/2 for sows and 5 1/2 for barrows.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending December 1.

Dec., 1839.	6 A.M.	12 M.	6 P.M.	Wind.	
Monday,	25	53	53	44	S.

A RARE CHANCE.

For sale. A partner wishing to withdraw from an old established Agricultural Implement and Seed Warehouse, having a good run of country custom, would be willing to dispose of his interest on liberal terms, as he is about engaging in other pursuits. To a person wishing to engage in a respectable and profitable business, having some ready capital, it is an opportunity rarely to be met with. A liberal credit will be given on most of the purchase money if properly secured. Any communications addressed "Lafayette," New York city, will be treated strictly confidential.

SPLENDID BULBOS FLOWER ROOTS.

Just received by JOSEPH BRECK & CO. from Holland, very large and well selected assortment of Dutch Bulbous Roots, among which are the following:—

HYACINTHS.—Double white, double white with red and purple eyes, double rust, double red, dark blue, light blue and yellow, single white, white with red and purple eyes, rose, pink, red, light and dark blue, yellow and variegated, comprising 120 varieties of choice named sorts.

TULIPS.—Fine late named sorts, fine don't do, mixed single, mixed double, single and double Van Throll for forcing, Patis, &c. &c.

CROWN IMPERIALS.—Double red and yellow, single red and yellow, striped leaves, &c.

POLYANTHUS NARCISSUS.—White, yellow, white with yellow and citron cups, and citron with yellow cups.

NARCISSUS.—Orange Phoenix, Sulphur Phoenix, Incomparable, Van Sion, and Trestus centus, with double flowers; Trumpet major, Sulphur and Potentus, with single.

JOSQUILLAS.—Double and single.

RYSCUSCULUS.—Large double red and yellow Turkey, and other varieties.

ANEMONES.—Many fine mixed and named varieties.

LILIES.—English, Persian, Spanish and Sessans.

CRYSANTHEMS.—White, blue, purple, yellow, cloth of gold, striped, &c. in 25 sorts.

GLADIOLUS.—Bizenium communis, with purple, red and white flowers; Cardinalis.

LILIES.—Double white Chinese, double red, do, double red and double white, double purple fringed, fennel-leaved, &c.

Also—Snow Drops, Anaryllis, Tuberosus, Ornithogonum of all sorts, Arum dracunculus, Geranium tuberosum, Allium flavum, Hyacinthus monstrosus, pianosus, botrioides and Belgicus of sorts; Fritillarias, Cyclamen, &c.

The above choice collection of bulbs have been selected with much care, from one of the best houses in Holland, and are offered to purchasers with great confidence, believing they will give universal satisfaction to all who will give them a fair trial. Orders should be forwarded soon, to the subscriber, No. 52 North Market Street, office of the New England Farmer. A liberal discount will be made to dealers. October 23. JOSEPH BRECK & CO.

IMPROVED PIGS FOR SALE.

For sale three, improved Pigs of the following breeds; One half Berkshire and half Mucky; One half Berkshire, quarter Mucky and quarter Mecha. One half Berkshire and half a large English breed, name not known.

The above hogs are two years old; they are disposed of on account of keeping young sows of their get for breeders. They will be sold cheap if applied for soon. For terms, &c. apply to J. BRECK & CO. November 13.

BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones from the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of Ground Bone, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel; put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells
Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention

ROHAN POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, at 85 per barrel. October 16. JOSEPH BRECK & CO.

Fruit and Ornamental Trees, Mulberries, &c.

Fruit Trees of all the different species—of the most celebrated and surpassing kinds—the collection now offered is large. The Catalogue of Fruit and Ornamental Trees and Shrubs, Roses, and Herbaceous Flowering Plants, for 1839, is ready and will be sent to whosoever who apply. In that catalogue the very best kinds of fruits, so far as proved, are particularly designated by a star.

10000 TREES, MERITCAULUS Trees or any other reasonable quantity, or cuttings of the same, are now offered. The trees are genuine; all being raised by the subscriber, either at his Nursery here, or at his Southern Establishment at Portsmouth in Lower Virginia. Also the Elata, Cantone, Broussa, Moretti or Alpine, and some other Mulberries, Cockspur and Duchinon for Hedges, &c. &c.

All orders will be promptly attended to, and trees when so ordered will be securely packed for safe transportation to distant places. WILLIAM KENRICK. Nonantum Hill, Newton, Mass. Oct. 9.

MISCELLANEOUS.

TROPICAL PLANTS—SPICES.

Cinnamon is a tropical plant, growing in the East Indies, and is largely cultivated in the island of Ceylon, where there are more than 16,000 acres in cinnamon plantations. The bark of large shoots of thicker branches is coarse, the finer kinds are obtained from the smaller or more delicate shoots. The best is thin, smooth, shining, and of a light yellow color, bends before breaking, and is splintery in its fracture.

Cassia.—The cassia of commerce is nothing but an inferior quality of cinnamon. The finest cinnamon brings two dollars a pound, the second sort from one dollar thirty to one dollar fifty cents, and the third sort about a dollar. These are the prices in England, where the duties are from twentytwo to seventyfive cents per pound.

Pepper grows on a perennial climbing plant. The leaves are heart-shaped, with a glossy surface, and have little smell or pungency. Small white flowers grow abundantly on all the branches, and these are succeeded by the berries, which are green when young, and become of a bright red when approaching maturity. They hang in large clusters, like bunches of grapes; but the berries grow distinct, more in the manner of currants. It is raised in plantations of five hundred to one thousand plants, divided by hedges. Sumatra, and the neighboring islands in the Indian Archipelago, produce the greatest abundance of this spice.

Ginger grows both in the East and West Indies. It has a perennial root with annual stems. The roots creep and extend under ground in joints, from each of which a slender stem shoots forth in spring, and attains a height of two or three feet. On the top of the stalk is a scaly spike, from each of which scales a blue flower appears. When arrived at maturity, the root is taken up, and forms the ginger of commerce. It is afterwards ground in flour or other mills for use.

Nutmeg and **Mace** are the produce of the same plant. It has its male or barren flowers upon another, being a dioecious plant. The flowers are white, bell-shaped, and grow at the extremities of the branches, two or three together. The embryo fruit lies at the bottom of the female flower, like a little red knob, which afterwards expands, and at the end of nine or ten months it has the appearance of a peach. The outer coat is fibrous and hard, about half an inch thick; and when arrived at maturity this bursts and a membranous covering of a fine red color is seen, enveloping the thin black shell which encloses the kernel or nutmeg. The covering is the mace of commerce. The mace resembles verdant net work; and, when collected, is left in the shade to dry, after which it is pressed closely in bags and exported. The shell of the nutmeg is hard, and is subjected to the heat of fire before being broken. The kernel thus shrivels up, and is then subjected to the action of lime and sea water to destroy the vegetating principle.

Fools line the hedges which bound the road of life—what can the wise man do but smile as he passes along it.

Morus Multicaulis, Esq., is likely to be strongly opposed as a presidential candidate, by Rohan Potato and Ruta Baga, Esqrs.

Winter is coming, and it is incumbent on the head of every family to devise measures for keeping his households, as well as himself, warm and comfortable during the approaching winter. To do this, it is not only necessary to look to the quantity and quality of fuel in store—but the doors must be latched, the windows fastened down and caulked, and every crevice in the floor or wainscot filled.—The cold air must be excluded—until that is done it is folly to expect that a room can be kept warm. Indeed in many of our New England dwellings, where the furniture and the arrangements present an aspect of competence and comfort, it is usual in very cold weather for the blue looking group collected around the fire to complain that their shins are roasting, while their shoulders are freezing!—Currents of air rush in from various quarters—and agues, colds, catarrhs, and rheumatism, are the order of the day. A couple of hours' labor at this season, will prevent weeks and months of discomfort hereafter.—*Merc. Jour.*

Fidelity of a Dog.—The *St. Augustine News* of a late date, mentions the following touching incident:

An Irish greyhound, owned by Col Harney, and which he had brought from Missouri, had formerly a very strong attachment to M. Dallan, the owner of the trading establishment at Caloocanlatelite. On the massacre of the men at that post, but little hopes were entertained by the survivors but that the dog had either been killed or captured by the Indians. Fourteen days after the occurrence, on the arrival of troops to give sculpture to these victims of Indian faithlessness, this faithful and attached animal was found, barely able to stand, emitting a feeble howl over the remains of his friend, Mr Dallan. The corse around were denuded by vultures, but Dallan was uninjured. This noble trait of fidelity was duly appreciated by the troops, and Ronco, the trusty guardian of a dead friend, is now sincerely and devoutly cherished by the garrison at Tampa Bay.

The poor pittance of seventy years is not worth being a villain for. What matters it if your neighbor lies in a splendid tomb? Sleep you with innocence. Look behind you through the track of time! a vast desert lies open in retrospect; through this desert have your fathers journeyed; wearied with tears and sorrows they sink from the walks of men. You must leave them where they fall; and you are to go a little further, where you will find eternal rest. Whatever you may have to encounter between the cradle and the grave, every moment is big with innumerable events which come not in succession, but bursting forcibly from a revolving and unknown cause, fly over the orb with diversified influence.—*Blair.*

Imaginary evils.—If we except the blessings of strength, health, and testimony of a good conscience, all the other conveniences and pleasures of life depend on opinion. Except pain of body and remorse of conscience, all our evils are imaginary.

BENEVOLENCE.—Well, neighbor B, what's the most Christian news this morning?" said a pious gentleman to his rich friend, the deacon. "I have just bought a barrel of flour for a poor woman."—"Just like you! Who is it that you have made happy by your charity this time?" "*My wife!*"

An. Mterative.—"If you don't accept my challenge," said one gentleman of honor to another, "I'll gazette you—so take your choice." "Go ahead," said the other—"I had rather fill six gazettes than one coffin."

A writer in the Morning Dispatch says the coloring matter of the Blue Ink, so much used, is not Prussic Acid, but Indigo. The spurious, pale blue ink is of Indigo, but the real article, "blue as a whetstone," when spread on paper, and growing in a few days as black as jet, is one of the most poisonous of all known substances.—*Trae.*

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay and Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent objects of this application, and some of the consequent peculiarities of the machine are:

1. Secures a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With one this moderates power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

WINSHIP'S BRIGHTON NURSERY,

AND BOTANIC GARDENS.

Fruit and Ornamental Trees, Shrubs, Creepers, Herbaceous, Perennials, Green House Plants, &c.

Orders addressed to Messrs WINSHIP Brighton, Mass., will be promptly executed and forwarded to any part of this or other countries.

April 19.

Fruit and Ornamental Trees, Flowering Shrubs, Plants, &c.

The present being the most favorable season for transplanting all hardy trees and shrubs, we would remind those who are in want of Fruit or Ornamental Trees, Shrubs, Herbaceous Plants, &c. that we can furnish them at short notice at nursery prices, well packed for transportation to any part of the country. JOSEPH BRECK & CO. October 15.

FRUIT AND ORNAMENTAL TREES, &c.

An extensive assortment of the finest varieties of Fruit Trees, and a great variety of Ornamental Trees of large size. A fine collection of Herbaceous Plants, Roses, Honey-suckles, Peonies, &c. 50,000 genuine *Morus Multicaulis* Trees, of large size, the growth of Virginia. Also—1000 bushels of Idaho Potatoes. Orders addressed to the subscriber will receive prompt attention. JOHN A. KENRICK. Newton, Nov. 4, 1839.

PEAR TREES.

For sale at the garden of the subscriber a large collection of Standard and Dwarf Pear Trees comprising most of the choice varieties of European and American origin.

Orders by mail will be immediately answered. ROBERT MANNING. October 16.

DOMESTICATED WILD GESE.

A few pair for sale. Enquire at this office. November 6.

GREENHOUSE GLASS.

All sizes and qualities, for sale by LORING & KUPPER, No. 10 Merchants' Row. November 6. 21

AGRICULTURAL.

ADDRESS

delivered before the *Agricultural and Horticultural Societies of New Haven County, Sept. 25, 1839.*—
By HON. JESSE BUEL.

I appear here, gentlemen, by invitation, to address you on the cultivation of the soil, which is the object of the associations here convened to promote improvement in. I have been prompted in the undertaking, rather by a desire to render a service, than from a confidence in my ability to perform one; and in the few remarks I have to offer, all need much of your indulgence, for defect in style and deficiency in matter.

Agriculture and Horticulture are intimately related to each other. They both depend upon the soil, and the animals and plants which it nurtures. Labor, for profit, and for pleasure. They both minister, and are indispensable, to our wants and comforts. They are governed in their operations by the same natural laws. Agriculture has cognizance of the farm, which supplies our principal wants: Horticulture, of the garden, which administers to our more refined appetites, to our health, and to the rational pleasures of the mind. The one gives us bread and meat, and the materials for our clothing; the other the choice delicacies for our table, and multiplies around us the charms of rural beauty and rural scenery. Both tend to beget habits of useful industry and sober reflection, and to improve us in all the social relations of life. It is befitting, therefore, that institutions designed to foster and promote improvements in these primary and associate branches of labor, should unite in their anniversary celebration, and in returning thanks to the Supreme Being, for the bounties of a fruitful season.

Of the utility of these celebrations, and exhibition of the products of the farm and garden which are made at them, I have no kind of doubt. They bring to public notice whatever is new and most valuable, in a business which highly interests us. They perform the work of years, in diffusing useful knowledge in all the departments of rural labor.—They awaken, in the bosoms of hundreds, the dormant powers of the mind, which otherwise might have slumbered in apathy. They excite to industry, to emulation, and to the study of those laws which every where control the visible creation, and which enlighten and reward all who humbly seek and follow their counsels. Nor is it the cultivator of the farm and garden alone that are to be benefited by these exhibitions. Whatever tends to increase and improve the products of the soil, serves to augment the common stock, and enables the grower to supply the market with more and better products, and to buy more liberally of the other classes in return. The merchant, the manufacturer, the mechanic, and the professional man, have all, therefore, as deep an interest in promoting the improvement of agriculture and horticulture, as the farmer and gardener have. Society is in some

measure a joint concern, at least so far as relates to what are termed the producing classes; the more these earn by their labor, the greater is the accession of substantial wealth to the community. The amount of honey in a hive, depends not upon the number of bees which it contains, but upon the labor and skill of the working bees. The farmer virtually provides for the other classes, and is at the same time their principal patron and customer; and although his labors are too often held to be low and menial, by those who cannot or will not appreciate their value, his condition affords the best criterion by which to judge of the welfare of those around him. No country can long flourish, or preserve its moral and physical health, whose agriculture is neglected and degraded.—The amount of a farmer's sales, and of his purchases, will depend upon the surplus products of his farm, and upon the profits of his labor. Double these by an improved system of husbandry, which I feel assured can be done, and which has been far more than realized, in many old districts of our country, and you will double the substantial wealth of the neighborhood, and impart corresponding life and activity to every other department of business. If we look to Spain, to Portugal, to a great portion of Italy, to South America, or any other country where agriculture is neglected, or holds but a subordinate rank, we shall find a degraded population, characterized by superstitious ignorance, poverty and crime. Every class of the community, therefore, has a deep interest in promoting the improvement of the soil; and all should willingly contribute their aid towards enlightening, honoring, and rewarding those who are honestly employed in its cultivation.

With regard to the utility of agricultural and horticultural societies, much will depend upon the objects which bring together their members. If they associate for selfish purposes, merely to monopolize the spoils, and withdraw whenever they are disappointed in their sinister hopes, jealousies and apathy will ensue, and the association will fall, as many under like circumstances have fallen, without public loss or public regret. But if the association is formed for mutual improvement, and in the patriotic desire to do a public good; to stimulate and reward industry and enterprise, however humble their condition—and strives by concentrated and persevering efforts, to improve the condition of a district, of a county, or a state,—then will it inspire public confidence, obtain public support, and become a public blessing. To illustrate this last proposition, I beg to refer to some association which have been tried, and whose labors have been crowned with palpable and brilliant success.

The counties of Berkshire, Essex and Worcester in Massachusetts, have each, for many years, maintained an agricultural society; and they each distribute ten or twelve hundred dollars a year, one half of which is paid out of the state treasury, in prizes to successful competitors in the various departments of agricultural and household labor. It is said, and I believe with truth, that every dollar thus expended has made a return of twenty dollars, in the increase of agricultural products which it

has caused; and so satisfied are the inhabitants of the benefits of the expenditure, that an increased spirit is annually manifested, by all classes, to maintain and perpetuate these nurseries of industry and improvement.

The Highland Society of Scotland affords another illustrious example of the utility of agricultural associations, when conducted with a view to public improvement. This society was organized in 1784, but so few were its members and so limited its means, that it attracted but little public notice, nor effected any great improvement in husbandry till the commencement of the nineteenth century. Yet it had sown the good seed which never fails, under proper management, to yield to the husbandman a bountiful harvest. Nor did it fail in this case.—The society now numbers twentytwo hundred members, embracing most of the opulent and influential men of the country, of all professions, and distributes annually in prizes, about seventeen thousand dollars. In no country or district has agriculture made more rapid strides in improvement, than it has in Scotland, since the organization of this society; and although it may not have been the only, it most assuredly has been a principal cause of this wonderful and salutary change. Up to 1792, the agriculture of Scotland, to adopt the language of the Edinburgh Quarterly Journal of Agriculture, was "wretched—excessively bad, in all its localities." Hardly any wheat was attempted to be grown: oats fill of thistles was the standard crop, and this was repeated on the greater part of the arable land, while it would produce twice the seed thrown into it; turnips, as part of the rotation of crops, was unknown, few potatoes were raised, and no grass seeds or clover were sown. A great part of the summer was employed, in the now fertile shire of Fife, in pulling thistles out of the oats, and bringing them home for the horses, or moving the rushes, or other aquatic plants, that grew on the bogs, around the homestead." But a change soon came over the land. The seed which had been sown by the Highland Society had germinated, and its luxuriant foliage already covered the soil. In 1815, according to the authority I am quoting—"beautiful fields of wheat were to be seen.—drilled green crops every where abounded.—the bogs had disappeared,—the thistles no longer existed,—naked fallows were abolished, draining was extensively introduced: wet lands were made dry; poor weeping clays were converted into turnip soils; and whole parishes were completely transformed from unsightly marshes into beautiful and rich wheat fields; and where the plough could scarcely be driven for slush and water, were heavy crops per acre, and heavy weight per bushel." The improvements in Scotch husbandry have continued to advance, until, according to the estimate of, Sir John Sinclair, and Professor Lowe, both high authorities,—until the acreable products of her soil more than double those of our Atlantic States.

The means adopted by the Highland Society to effect these radical improvements in Scotch husbandry, are such as may be employed by us with almost a certainty of corresponding success. "In

the days of its youth and feebleness," says the Quarterly Journal I have just quoted, "the Highland Society sent the Leaven of the tennp husbandry into all the glens and straths of the north, by offers of small prizes to certain Highland parishes, and the same may be said as to the growth of clover and the finer grasses. As it advanced in strength, as to numbers, and to cash, attention was turned to premiums for stock; then came offers of reward to men of science to discover better implements and machines, to diminish friction, and consequently draught, such as in the threshing mill, and other parts of agricultural machinery. Still advancing in the scale of intellect and of science, premiums were offered for essays to bring to light the facts connected with chemistry and natural philosophy; and, under the auspices of the society, was set up the Quarterly Journal of Agriculture, a work which has been the vehicle of conveying so much useful information to the agriculturist, that we humbly venture to say, it ought to appear on the book-shelf and table of every farmer's parlor. After this, the great stock shows were resolved upon." At the Glasgow show in 1838, there were exhibited for prizes, 461 neat cattle, 121 horses, 274 sheep, and 47 swine; total, 903 domestic animals, in 634 lots. Of the other kinds of competitors, the numbers were as follows:

For Butter,	18
" Full Milk Cheese,	15
" Skim Milk Cheese,	6
" Wool,	8
" Roots and Seeds,	13
" Implements,	28
—	—

In 88 lots.

The number of persons present at the exhibition was estimated at over 17,000, besides workmen and official people,—not one thousand of whom probably left the exhibition without carrying home with him some newly acquired knowledge in his business, or some new stimulus to improvement and industry. Not only has Scotland profited by the labors of her agricultural society, but Great Britain generally, and even the United States have been highly benefited by them. The information which that society has promulgated, has been widely disseminated among us by our agricultural journals, and has contributed not a little to the improvement of the agriculture of our country. And in England, which had been thrown into the back-ground by the superior improvement of Scotch husbandry, it has within the last year, induced the formation of the English Agricultural Society, on a broad and liberal scale, which promises important advantages to English husbandry and to agriculture generally.

As evidence of the utility of horticultural societies in multiplying and improving the products of our gardens, and in promoting rural embellishments, I would refer to the neighborhoods of Boston and Philadelphia, where societies of this kind have long existed, and to the Horticultural Society of London. In the first named cities, and their environs, the progress of horticultural improvement has been manifestly great. Many new and choice fruits, culinary vegetables and ornamental plants, have been introduced, culture has been much improved, the markets better supplied, and prices cheapened.—The London Society, although its garden has been established but about twenty years, has concentrated in it from both continents, and from the islands of the sea, embracing every clime, more than five

thousand varieties of edible fruits, including fourteen hundred varieties of the apple, and seven hundred of the pear, and an innumerable number of ornamental plants, many of them before unknown in our catalogues. Its collections of pears, which embrace hundreds of recent origin, from Flanders and from France, have been already broadly spread over these States, and supply our dessert with a successions of this delicious fruit. As a corresponding member of this society, I have participated, and have enabled others to participate, in the good which it has been generously diffusing abroad. In 1825, and at subsequent periods, I have been supplied liberally with grafts of the choicest fruits which it had collected.

The great obstacles to horticultural improvement are ignorance of the relative merits of different kinds of fruits and culinary vegetables, and of the proper modes of cultivating and preparing them for the table. The generality of country gardens exhibit but a scanty assortment of vegetable productions, and these are but badly cultivated, and often of inferior quality. The tendency of horticultural exhibitions is, to show the good and bad in contrast, or rather to promulgate a knowledge of the better sorts, of their culture and use—to excite useful competition, and to demonstrate the utility of garden culture, as a source of health, pleasure, and profit. I have had many fruits presented to me, which the donors considered of the first quality, but which I found, on comparison, to be of secondary, or inferior grade. The man who has seen or tasted only inferior fruits, may well mistake them for good ones. It is as easy to cultivate good fruits as bad ones; and no one eats so good fruits as he who cultivates them himself. It is as easy to cultivate the vergetale as it is the choke pear; the green gage as the horse plum; and yet the difference between them, in all the qualities which we most esteem, is incomparably great. But till we can show our neighbor better fruits, he will continue to cultivate and rest content with his choke pear and horse plum.

With regard to what is termed ornamental gardening, or the cultivation of flowering shrubs and plants, there is an objection, real or affected, often made by very many people, on the ground that it yields no profit. If the great object of life was to accumulate money, without enjoying any of the comforts which it confers, save the gratification of animal appetite, the objection would be conclusive. But we are endowed with other and higher appetites than the mere brute; and Providence has every where surrounded us with suitable objects for their development, and innocent gratification. And shall we reject the proffered benefaction so kindly tendered for our benefit, because it adds nothing to our pelf? And what is there in the natural creation, better calculated to soften down the rough asperities of our nature, to awaken kind feelings towards each other, and excite reverence and love for the Most High, than a familiar acquaintance with the wonders and beauties of His vegetable Kingdom? Did you ever know a misanthrope, or a miser, who was an admirer of flowers? I would not recommend the neglect of more important duties for the culture of a flower garden; yet when their is ability or leisure, and these may be found to a greater or less extent in almost every family, a taste for floral beauties should be inculcated in the young, not only as a source of rational pleasure, but as a salutary precaution against bad companions and bad habits. The mind must be employed

and must have recreation. It is better to direct it to the works of the Creator than to the works of man. Lord Bacon has said of the garden, "it affords the purest of human pleasures—the greatest refreshment to the spirits of man—without which, buildings and palaces are but gross handiworks."

But I am forgetting myself. In my ardent commend horticulture, for its useful, elevating, and purifying influence upon the habits and manners of society, I did not recollect that I am addressing the highly polished inhabitants of a classic city, who have long since demonstrated, in practice, the truth of the lessons I would inculcate. I will therefore dismiss this branch of my subject, and turn to the more rugged, though not less important topic of agriculture; barely adding,—

That in all endeavors to improve the condition of society, whether religious, moral, or industrial, individual efforts and example can affect but little; and hence, that in every great work of reform or improvement, the concentrated strength of many has been resorted to, and brought to a focus by means of associations; and that the great objects of society are not likely to be promoted in a more eminent degree, by any, than by associations formed for like purposes with those which I have now the honor to address.

Being a native of this State, and having spent my early days within its borders, I can well remember the farming practices that were wont to prevail. The farm was, to use the commendatory language of that day, "suitably divided into meadow, pasture and plough land," and each division was exclusively devoted to its object, until most of the nutritious grasses had "*run out*," in the meadow, and the plough land had become too much impoverished to bear a remunerating crop. Many an acre was turned into "old field," or commons, destitute alike of natural or artificial herbage, affording scant gleanings to half famished cattle. I beg not to be misunderstood. I am describing what *was* a feature in Yankee husbandry. Farming has no doubt recently undergone great improvements in Connecticut, as it has elsewhere. Yet on a fair comparison with highly cultivated agricultural districts, I believe that it will be found that the husbandry of this State, in the main, is susceptible of great improvement. The lands of Connecticut were originally rich and productive. The earthy elements remain in a great measure unchanged; the seasons are about as propitious as they were wont to be; and the lessons in improvement that have been taught elsewhere leave little reason to doubt that under proper management, they may again be restored to their original fertility.

{Concluded next week }

From the Genesee Farmer.

HINTS TO FARMERS.

MR. TRUCKER.—The time is near at hand that requires the attention of every farmer in our country respecting the protection of their domestic animal through the inclemencies of the coming winter.—It is highly necessary that we should have our out buildings in good repair for winter, and see that every thing is taken care of, and put in their respective places ready for use in the spring. The present time is a very important one for doing all these various employments, so that when cold winter comes, we shall be ready to sit down by our own firesides, and enjoy all the pleasures that can be derived from a domestic life. No season in the

ear can farmers enjoy themselves so well as in the winter; then their labors are closed for a season, and all they have to do, is to see that their cattle are well taken care of, and have a sufficient quantity of food to eat. At this season of the year the farmer can inform himself respecting the different modes and regulations of farming the coming year. The evenings are of good length, and when the day has passed away, he can sit down with his children around him, and obtain all the knowledge he consistently can in ascertaining a right method to pursue agriculture in future. The right method for us to obtain a complete knowledge of agriculture, is to subscribe for some agricultural journal and lend our leisure moments to its perusal. Many farmers of my acquaintance, in this section of country, are as ignorant of what is transacted in our government, as though they were inhabitants of some other clime, and did not as much as even pursue a paper.

While I am now writing, the 10th of November, the ground is entirely covered with snow, and very cold too; which ought to make us farmers very diligent in preparing our buildings to receive the coming storms of winter with readiness. Let us be very expeditious, and improve the present moments in repairing and fixing our sheds, barns, &c. to protect our domestic animals through the winter season. Nothing appears so negligent in the eyes of the people, as to see cattle and sheep exposed to winter's blasts, with scarcely enough to eat, and almost frozen to death. It is enough to make the blood run cold in our veins, to see such negligence carried into effect in this highly favored country, where every thing is so very plenty. Every farmer of common sense ought to know, that to have first rate cattle or sheep, they must, of course, be protected from the cold weather, be pretty well taken care of, and not more than half starved. In this way, farmers will have good cattle and sheep, and find them always ready for market, and bring a very high price, too.

The greatest difficulty with the farmers in this section is, they neglect to prepare sheds for the protection of cattle, and thus we are always hearing them complaining about having poor cattle in the spring of the year. Now, the reason of their cattle being so very poor, is obvious to every farmer who has tried the protection of their domestic animals in the winter. No farmer can expect to have first rate cattle, and let them be exposed to the inclemencies of our cold climate. I care not how well they are taken care of, unless they are protected, they will look poor when spring arrives. Many farmers in this region, who have heretofore made it their practice to winter their cattle exposed to the cold storms, have come to the final conclusion that it is a very poor rule to follow, and have commenced erecting out-buildings for their protection. A great many in our country do not believe that sheep need any protection; they say their wool will keep them from being cold, and will do just as well as to have shelters for them. Now, sheep, in my opinion, need a shelter in winters as much as our horses or cattle, that is, if we wish them to look fine in the spring, and ready for market any time. Sheep are useful animals to mankind, therefore it stands us in hand to have them protected from the cold storms, which are our constant visitors in this latitude, at this season of the year. In wintering calves, it requires very careful management on the part of the farmer, to have them look fine when winter has passed away,

and the beauties of spring have arrived. As our country grows older, no doubt it will grow wiser, and the farmers learn the right method of pursuing their pursuits of husbandry in future years. What few years I have been permitted to live, I can see that agriculture has improved a great deal, and will in all probability, continue to improve, until it arrives to perfection. The farmers can, at present, perform their usual pursuits with a great deal more ease and comfort, than in former years, and enjoy all the pleasures of a rural and domestic life. Twenty years ago there was scarcely an out-building upon a farm in this section of country; but of late years, the farmers are becoming more wise, and have commenced erecting sheds, &c., for the protection of their cattle and sheep; and they find it to the comfort and convenience of the animals, and therefore a neat profit to themselves. The time, I hope, is not distant, when the farmers in our own happy country will make it their practice to protect their cattle and sheep during our long and severe winters; and when this is done, there will not be so much complaint about poor cattle in the spring. No one will pretend to say that protection is an injury to cattle, though there are many that pretend to say they will do just as well, and not cost half as much. Now, sir, to keep a lot of cattle through the winter, under protection, does not cost one cent more than to have them ranging from one field to another, and foddered about stacks.

W. S. T.

[The following Report having been mislaid must be our apology for its not appearing sooner.]

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Oct. 19, 1839.

Dr Z. B. Adams exhibited several baskets of the St Michael's, Seckle and St Germain Pears.

Mr French exhibited the following Apples, viz: Yellow Bellflower, Monstrous Pippin, Lady (Pomme d'Api,) Hawthorndean, and four unnamed sorts; also the Wilkinson Pear, and one sort the produce of an imported tree—name unknown.

Mr Paine exhibited very superior specimens of the Brown Beurre Pear, from the well known garden of Perrin May, Esq., Boston.

Mr R. Ward, of Roxbury, exhibited large and beautiful specimens of the Seckle Pear: we think they have not been surpassed at any exhibition this season.

Mr Manning exhibited the Boxford, Killiam Hill and Ribstone Pippin Apples.

Mr Lowell exhibited the Glout Morceau, Delight of Hardenpont, and Grande Bretagne d'or Pears.

Mr Isaac Harris exhibited a basket of St Michael's Pears, the produce of his garden, North Bennet St.

Mr J. H. Donklee exhibited specimens of the large Spanish chesnuts, grown in his garden at Brighton.

J. P. Davis, Esq. exhibited specimens of the following Pears, viz: Easter Beurre, Duchess d'Angouleme, Beurre d'Amalis, Beurre Diel, Beurre d'Arenburg and Dix Pears; Talnan Sweet Apples. The Easter Beurre and Duchess d'Angouleme were very large and beautiful—the latter weighing 17 ounces.

The Society are under great obligations to N. Longworth, Esq., of Cincinnati, Ohio, (by the politeness of Mr Stetson, of N. Orleans,) for the present of a basket of fine native Grapes. These grapes, Mr Longworth states, after twenty five years

search, to be the finest he has been able to meet with, and from an examination of the same, the committee acquiesce in the opinion of Mr Longworth and believe from their fine flavor and delicate pulp, they are the best native grape which has been presented to the Society.

The following Pears from the collection provided by the Society, were examined to-day, viz: Wilkinson, Verte Longue, (New Duhaud,) Winter Nelis, Beurre Diel, Alpha and Napoleon.

It will no doubt be gratifying to the friends of the Massachusetts Horticultural Society to know that this is the only institution in America or Europe which has established a weekly exhibition of fruit and flowers—a custom so conducive to improvement that we are surprised it has not been more generally adopted. One of its most important advantages is the opportunity thus afforded to the amateur, of comparing in a vast variety of instances, fruits of the same species under different degrees of cultivation, some raised in exposed situations, with no more care than every farmer can bestow upon his apple orchards, and others whose growth has been sheltered by trellises and walls, in the gardens of the city and vicinity and sedulously trained upon the most enlightened principles of the art.

Many of the garden fruits at the exhibitions of the Society are superb, and we are particularly pleased to observe so frequently among them those old and universal favorites, the St Michael's and Brown Beurre, equal or superior in size, color, and flavor, to the best specimens of former days.

We regret that not a single specimen of the Doyenne Gris has been exhibited during the present season. A sometimes met with this pear of highly respectable appearance, raised on standard trees, so that there is reason to expect very beautiful specimens under more favorable circumstances.

At no remote period we hope to see the skill and assiduity of our horticultural friends, rewarded by an abundant supply of all the best of the old and new varieties, grown either against a wall, a trellis or as dwarf standards. From this method of cultivation, which we are glad to see is yearly extending, the most satisfactory results may be anticipated, and in a few years our exhibitions may be enriched by numerous specimens, which like the St Michael's, Brown Beurre, Duchess d'Angouleme, and Beurre Diel of the past week, will far surpass the figures and descriptions of the European Pono-logical works.

For the Committer,

ROBERT MANNING.

Great Yield of Wheat.—The Amesbury Transcript says Richard White, Esq., of South Hampton, N. H. raised this season from fourteen quarts of Black Sea wheat, fifteen bushels. It was sown on half an acre of land in May, and all the compost that was used was one barrel of lime, slacked and spread at the time of sowing.

Working Oxen.—When oxen refuse to work equally well on either side, or when they pull off against each other, yoke them on the side you wish them to work, and turn them out to feed in that way; they soon become accustomed to it, and work afterwards on either side alike.—*Amer. Farmer.*

The Philadelphia Gazette says corn cobs are better than charcoal to kindle coal fires.

From the New York Observer.

DR. HUMPHREY'S THOUGHTS ON EDUCATION.

Qualifications of Teachers.

(Continued.)

A fifth qualification for the highly responsible office of school teacher is the *faculty of government*. Every school as well as every family must be governed. *How* the prerogative should be exercised, we will inquire in another place. But I repeat that every school *must* be governed. No system of popular education can be sustained, or ought to be sustained, where the scholars are the masters. We send our children to school to be under governors as well as tutors; to learn obedience, as well as to be ably and faithfully instructed in the elements of useful knowledge.

In the first place, their own best good requires it. The boy that is allowed to do as he pleases in school, is not the boy to apply his mind diligently and successfully to his studies. He has too many other things on his hands. And what is true of one individual, is true of the whole school. Where there is little or no order and subordination, not one in ten will be disposed to make the most of his time and opportunities, if he *could*; and not one in the school, be it ever so large, will be able to if he *would*. How can he? Want of government, is but another name for universal disorder. And where lawless confusion reigns, where there is every thing to distract the thoughts and nothing to fix them, how can you look for study and improvement? It is only where the discordant elements of a district are brought together and subjected to a controlling central power, and every thing falls into its proper place, and is kept there, that any educational system will succeed. The school must first be hushed to silence; every scholar must have his place and his task assigned him, and the question of entire subjection to rules must be settled, before there can be any real study. This being admitted, it follows, that you could hardly inflict a greater personal injury upon your children, than by sending them to an ungoverned school: for they would not only lose their time, but contract habits of insubordination, which would expose them to a thousand indiscretions and dangers in after life.

In the next place, the great interest which parents have in the education and good conduct of their children, requires that the schools to which they send them, should be well governed. If children are not kept in proper subjection at school, it will be far more difficult to control them at home. What the parent does one day to secure implicit obedience in his family, may be counteracted and nullified by a riotous laxness in the school, the next. How often has this counteraction been felt and deplored. And besides, are not "the children which God hath given us," "bone of our bone and flesh of our flesh"? Can they lose their education or any part of it for want of proper discipline, and we not suffer with them? Can they become restive under the wholesome restraints of society, in consequence of not having been kept under due subjection in school—can they violate the laws of the state, and suffer the penalty, and we not smart for it ourselves? It were impossible.

It seems hardly necessary to add, once more, that the whole community has a deep stake in the government of its common schools. What it wants for its highest security and prosperity, is the great-

est possible number of good and enlightened citizens—men who having been accustomed to subordination in the family and the school, are prepared to submit, as a matter of course, to all the needful restraints of civil society. In well governed schools you find all the elements of well governed states, and without these essential elements in the former, who will answer for a cheerful and sacred regard to the laws in the latter? But who are to be the governors in our elementary and higher schools? The teachers, certainly, if anybody. We call them school-masters, and so they ought to be. But how can a man who has no talent for government, hold the reins with a strong and steady hand? He may stamp and threaten: he may fettle and flog, and thus make transgressors occasionally afraid of his terrors; but if there is nothing in his mind to sway the minds of his pupils; if he does not know how to bring them into subjection by some better influence than mere dread of punishment, he cannot be said to govern. There may be, and often is, a great deal of severity where there is very little government. The faculty of which I am speaking may doubtless be very much improved by experience. But some very estimable persons never can establish and maintain a proper degree of authority in the school-room, and therefore ought at once to withdraw and give place to those who can.

APPLICATION OF THE PRINCIPLES OF THE ROTATION OF CROPS.

There is scarcely any condition of agriculture, in the least degree advanced, or improved in operation, which is not based on some rude system of rotation, or succession of crops in a certain order.—It has long been known and almost universally acted upon, that, as to grain crops at least, the same kind could not be produced successively on the same land, without a rapid decline of product, from some other cause or causes besides the more lessening of the fertility of the land. For when land so treated and so reduced in product was put under some other crop, the product of such other crop was greatly better. Therefore, except in the earliest and rudest cultivation of a new country, no where is there to be found cultivated the same grain crop for many years in succession, without the interposition of some other crop, of other grain or of grass. Cotton is the only tilled large crop in this country which has not been alternated with other cultivation, and which is tended for years together on the same land. This practice is recommended by the clean condition of the land required by that crop, and which its repeated culture secures. But it may well be doubted whether the diseases and enormous losses of product in this crop, are not to be ascribed to its being continued so long on the same land.

But though every farmer uses something of a rotation, still the most usual courses of crops are very imperfect and highly objectionable; and there is scarcely any scheme of rotation which does not offend greatly, in some of its features, against the correct principles or theory of rotation.

The fact of the certain and rapid decline of product of any one crop repeated year after year on the same land, was universally conceded, and the practice generally abandoned, by practical cultivators, without their troubling themselves to investigate the causes. Theoretical and scientific agriculturists have entertained different views at different times, and each has had its reign. Formerly

it was supposed, and generally admitted, that each plant drew from the soil some food peculiar to itself, and thus rapidly exhausted the soil of this its own peculiar nutriment, while there still remained unconsumed, and in abundance, the food to support plants of other kinds. But though this theory passed current long, without dispute, because it served to explain the effects produced, it was gradual, weakened, and finally overthrown, by later and more correct views of the nature of the food of plants. It is but within the last few years that a new and opposite doctrine has been started, which is at least the most in fashion at present, if not the most generally received. This is founded on the discoveries of Macaire, De Candolle and Towers, of the excretions of plants by their roots; and the inference thence drawn that the rejected excrement is fit to serve as food for other plants, but is useless, if not absolutely hurtful to the kind from which it was thrown off. And hence also would follow the necessity for a change of crops.

Without denying or advocating either of these doctrines, I will yet add to whatever may be the main cause which calls for a frequent change of crops, *another cause*, of at least very considerable operation, and which has been already named the first of these numbers. This is, that every plant is subject to be preyed on by its own peculiar tribes of insects, which are continued to be supplied by their proper food, and favored by the still continuing circumstances of the field, and therefore are increased continually in numbers, and in the destructive ravages, so long as the crop which feeds them, and the circumstances which favored their remain unchanged; and that these insects must be destroyed or greatly reduced in their numbers at powers of mischief, by a total change of the ground and of the treatment and condition of the field.—Perhaps these depredators may be invisible, for their minute sizes, and yet so numerous as to cause any extent of injury that is found to be suffered by unchanged tillage of any one crop, and which avoided by convertible husbandry or a rotation of crops.

But luckily, though the causes of such evils may be uncertain, the effects and the remedies are therefore not unknown. And the observations of both scientific and practical agriculturists have served to establish what have been termed the *principles of the rotation of crops*, which furnish a body of rules by which to test every particular scheme, or show its advantages and defects. But though most of these principles and the rules founded on them are universally received, still perhaps every writer and reasoner upon rotations differs in some important respect from all others; and my own views, and still more the rules and applicator founded thereon, which have been and will be offered in these numbers, have no authority, either in previous precepts or examples of practice. The adoption of the above named and new reason for rotation of crops, would alone require the introduction of new rules in determining a proper order of succession, and a considerable departure from the stated rules prescribed by any previous writer on this subject. But though the principles and rule laid down by every modern and well informed agriculturist may have differed in some respect from all others, and even if all were wrong as to the main cause of the necessity of changing crops, still all were right in the main, in their general precept and rules of ordinary procedure.

But though many scientific writers have laid

own the principles of proper successions of crops, and all modern agriculturists in writing, or in practice, have advocated particular rotations, still scarcely any two agree fully in their rules; and agreement in practice seems more the result of old custom and neighborhood example, than of thinking and reasoning. It is manifest that no particular course of crops can be prescribed as the best for an extensive agricultural region, nor for fields of different soil on the same farm, nor for the different conditions at different times, or even the same field, it is as much quackery to direct the same rotation or an extensive region, as it is to prescribe the same medicine for all diseases. When we hear of particular rotation (no matter what,) being generally pursued throughout a large district, it is pretty good evidence that the rule is pursued from custom, and not by reason. Some of our best farmers have no regular rotation, though always aiming to observe the sound principles of the succession of crops, by varying the succession, according to the changes of circumstances.

But if neither reasoning nor precept can point out always a right or perfect rotation, it is easy enough to learn from both what is wrong and injurious. And we can scarcely find any regular rotation in this country, which does not offend against some admitted principle and rule, and the most common have scarcely one redeeming quality, no matter by what test or principles the practice be tried.

The most important and indeed *indispensable* requisite of any good scheme of rotation, or course of crops, I take to be the following; and the observance of them may be termed the *three primary rules for rotations*. 1st. That the several crops which form the course, are among the most *profitable to the cultivator*, in the circumstances in which he is placed, of climate, soil and market. 2nd.—That the whole course of crops, taken through, is *profitable to the land*—serving to increase its productiveness, if poor—and at least retaining its productiveness, if already rich. 3rd. That each crop in the rotation serves to prepare for and aid the cultivation and production of the next which is to follow it, instead of obstructing either or both.

The two first of these requisites, either expressly or by implication, may be considered as embraced in every theoretical scheme of rotation, and aimed (however ineffectually) to be preserved in every judicious farmer's practice. The third is almost disregarded by all, and is certainly not by any placed in the important position, or viewed in the light which I think it deserves.

If all these three requisites be secured, any rotation will be good; if either be neglected, or be but imperfectly secured, the rotation will certainly be a bad one. The best devised rotation for the improvement of the land and its products, and perfecting the tillage, would be inadmissible, if any of the crops were of such kind as not to be either sold, consumed, or otherwise profitably used, by the farmer. Neither would the greatest annual sales justify another rotation, if it worked to impoverish the farm. And even if the *kind* of crops were to be the most profitable, and the improvement of fertility regularly advancing, what will it profit the proprietor, if the rotation operates to produce weeds and depredating insects in such numbers as greatly to increase his labors, and also to diminish their products?

Scientific agriculturists have laid down so many principles or rules, to be observed in planning ro-

tations, that it is impossible in practice to observe all, or perhaps half of them. Thus the English writers insist, perhaps more strongly than on any other point, that green (or grass and roots, or leguminous) crops, and white (or grain) crops should regularly be alternated. Others, that tap-rooted plants should alternate with fibrous and shallow rooted. But all these are minor considerations compared to the foregoing; and each or all of them might come in conflict, in the circumstances of this country, with one or more of the more important and indispensable requisites.—*Ed. Farmer's Register.*

[Communicated.]

TREATISE ON SWINE.

We learn that Messrs Weeks, Jordan & Co. have now in press and nearly ready for publication a work entitled the *AMERICAN SWINE BREEDER: A Practical Treatise on the Selection, Rearing and Fattening of Swine*. By HENRY W. ELLSWORTH. A treatise of this kind has long been needed by the agricultural community, and we hesitate not to promise for it a favorable reception and extensive sale. The volume exhibits *fully* the subject on which it treats, and contains numerous cuts of pens, troughs, piggeries, and different boiling and steaming apparatus. In short, it will be found a complete guide to the breeder of these animals; filled with interesting matter, presented in a neat and accurate style.

It is indeed gratifying to us, to announce the first comprehensive work on swine,—for beside the short pamphlet of Henderson, and the imperfect "Manuel du Charcutier" of the French Encyclopedia, little has been written on swine,—as an American production. Mr. Ellsworth has shown himself a master of his subject, and is copious in the details presented, and illustrates his suggestions by frequent reference to the practice of distinguished American and European breeders.

The design of the volume is sufficiently explained in the following short extract from the first chapter. "The object of the following pages is to present, within narrow limits and under proper heads, both general information and practical directions, in regard to the selection and management of swine; and to furnish, as it were, a digest, which the reader can consult at ease, of the results attending numerous investigations and experiments on this interesting subject, whose records are now scattered, too diffusely for general reference, throughout the multiplied agricultural periodicals of the day."

Our limits will only admit a passing notice of the contents of the different chapters. The first contains a description of the species of swine peculiar to the old Continent and its Islands, together with the various breeds of England and this country. The second chapter is on Breeding, which is ably discussed at length, and contains also directions for the treatment of young pigs—the apportionment of the litters of the sow, to suitable periods of the year, &c.—together with the method of spaying, and its substitutes.

The third chapter enforces the necessity of cleanliness, and furnishes numerous plans of enclosures, pens, troughs, piggeries, &c. The fourth chapter presents the various modes of preparing food, and contains also several cuts of boiling and steaming apparatus. The fifth chapter enters fully into a comparison of the various articles used as the food of swine. The sixth exhibits the modes pursued by

distinguished breeders in the rearing of the animals;—the diseases of swine and their remedies, together with the modes of slaughtering hogs, packing pork and bacon, the erection of smoke-houses, &c. &c. &c.

We repeat in conclusion that whether we regard the typographical execution of the volume, or the style of the author, the work will prove an acceptable offering to American farmers; and we doubt not they will appreciate the merits of a full and practical treatise on a subject so important to their interest.

We understand that it is the intention of the publishers of this volume, to make this the first of a series of agricultural works, adapted to this country. Their design is an excellent one, and we wish them success in its fulfilment. The present treatise is a 16mo. of about 300 pages.

WINTER BUTTER.

The best and the richest butter of the year is that made after the vegetation of the year is developed in May and June, as the food is sweeter then than at any other time. But notwithstanding all the care that can be used, in ordinary cases, such butter cannot be preserved through the summer, in a state fit for winter's use. There can be no doubt that packed in jars perfectly close, entirely freed from all buttermilk or extraneous matters, salted in the just proportion with pure salt, and kept at a temperature below 50°, the butter of June would be in perfection in January. This combination of favorable circumstances, however, can be rarely obtained, and farmers, as well as others, who do not keep milch cows for the purpose of supplying them with milk and butter through the winter, must rely on butter packed in autumn for their winter supply. Too many farmers, we think, are in the habit of delaying the providing their stock of butter too late in the season. The reasons for this are, it does not require as much care in making and working the butter to make it keep well, as it would if made earlier in the season; and if made late, and after a low temperature has arrived, packing may be dispensed with, or at least, may be performed very imperfectly. But such late made butter has several disadvantages. It is usually made from vegetation that has been more or less frost bitten, and therefore, does not produce milk of the richness and purity which is essential to the making of the best butter. Further, as the grasses decay, the range of feeding by the animals is increased, and vegetation, which at other times would be refused by the cows, is now eaten with avidity by them. If the farmer has a good supply of pumpkins or carrots which he can feed to his cows, he can make first rate butter at any time; but unless he is so provided, his stock of winter butter should be put down before his cows are driven to subsist on food that will be sure to deteriorate the article. The tops of almost any of the cultivated roots produce a greater effect on the butter than the roots themselves. Thus, when we have fed out the tops of the ruta baga to our cows, the effect on the butter has been very distinct and disagreeable, while in that from the cows fed on the roots and hay, very little alteration of taste was perceptible. Such butter should not be used for keeping, as it never grows better. Too much of the butter offered in the markets of this country is only fit for the soap-makers, and to them it should be consigned.—*Genesee Farmer.*

NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, DECEMBER 11, 1839.

WESTBORO' AGRICULTURAL SOCIETY.

We subjoin the Constitution of a Town Agricultural Society lately formed in Westboro', one of the best farming towns in the State, and continuing in proportion to its population, as large a number of inquisitive and well informed farmers as any other. It is an omen of good, and we wish that such a society were formed in every town in the State; or that where that might not be found convenient, that a society should be formed in every half dozen towns within easy distance of each other.

Such societies have been constituted at different times in several towns in the State, and while conducted with spirit, were productive of great pleasure and great good. But every thing useful in them must depend on their being conducted with spirit, interest and punctuality. The members must not suffer trifling matters to prevent their attendance; and they must in the best sense of the terms be glad to distribute and willing to communicate. They must be ready to detail their own experience; and be willing to listen to the experience of others. They must, in common parlance, 'give and take.' This supposes, however, that they have something to give. This should induce them to read and to make experiments; to inquire and observe. We say read. We recollect very well when advice to farmers to read would have been likely to have been met with a sneer. Those days are long since passed; and instead of being now as formerly ridiculous to commend book farming, the man only makes himself ridiculous, who talks against it.

By book farming in this case, we cannot be misunderstood, at least by the intelligent and reflecting; and as to those who are neither intelligent nor reflecting, it is a hopeless undertaking to attempt to correct their opinions.

Agriculture in the main is a science founded upon facts. There certainly is no reason why these facts should not be recorded and communicated in books; but there is this great advantage in its being so done over mere oral communication, in that the record of it is likely to be much more exact. In all our intercourse with farmers, we have found no reluctance in communicating what they have done; but many of these identical persons will speak with scorn of agricultural books and papers; and yet most of these agricultural books and papers communicate only what others have done.

But the knowledge of mere facts and actual experiments, connected with cultivation, is not all that is important in agriculture. Science in various departments has an intimate connexion with agriculture. Chemistry has already rendered much, and promises to render still more substantial aid to agriculture. It intimately concerned with the nature of soils and of manures; with the operations of heat and cold, of dryness and moisture upon vegetation; with many of the uses and modes of preparation of vegetable products; and with the influences of various substances in nature upon animal and vegetable life. We are not over sanguine in our expectations of the advantages which are to be derived from the application of chemical science to agriculture, because we perfectly understand that there is a limit to the researches of man, beyond which his sagacity cannot penetrate. Chemistry may explain to us the primary component parts of different soils and manures, and yet find it impossible so to combine these different

properties and elements as to produce the soil best and most exactly fitted to advance vegetation in the most perfect manner; as chemistry may be able to explain with exactness the component parts of blood, and yet be unable by the combination of any substances, in the most careful and exact manner, to produce a single perfect drop. Yet no one can doubt that chemistry, though it may not accomplish all that might be desired, may yet effect much that is useful. It may point out fundamental deficiencies in some soils which art can supply; and remedies in others which art can easily remove; and it may often detect the existence of mineral substances or acids, which operate as poison to vegetation, but which could be detected and corrected by no other means.

The application of chemical science to agriculture is comparatively of recent date, and its advances are of course imperfect; but we do not see why in respect to manures for example, it may not presently enable us to supply them in an artificial and concentrated form, so as to dispense with an immense amount of labor which is now necessary.

Chemistry has already rendered an immense benefit to agriculture, to mention no other case, in teaching the art of manufacturing sugar from beets, and especially in the great improvements which have been introduced into this process, by which the expense of the manufacture is greatly reduced and the amount per centage obtained is very much increased. The process of refining the product is likewise a chemical operation, in which science has lent its aid to the greatest advantage.

We might illustrate the importance and advantages of science to agriculture in various other respects; not only of chemistry but of botany, of mechanics, of mineralogy, of comparative anatomy, of the veterinary art, and in truth of every department of natural science. All knowledge of this kind, to say nothing of its value as a means of enjoyment and a source of the highest pleasure and improvement, has a direct bearing upon cultivation, general husbandry, and agricultural improvement.

The farmer likewise is directly concerned in the science of political economy. He is a citizen, and as such has responsible duties to discharge to the community. If the cultivator of large products, he is interested in all questions relating to the protection of domestic industry; in the commerce which deals in the large products of agriculture, and in which the trade of the world is concerned.

The farmer likewise is deeply concerned in every thing connected with education and the improvement of the mind. 'Knowledge is power'; physical power; moral power. Knowledge is pleasure. The mind was made for the acquisition of knowledge as much as the body was made to desire food. In proportion as education, intellectual education, proceeds among the farmers, their perceptions are sharpened, their judgment strengthened and improved; and all this will have an immediate and most useful bearing upon their great art as well as upon their personal character. In proportion as education advances among the farmers, their rank as a class in society is at once advanced; their self-respect stimulated and their ambition of excellence in their particular pursuit awakened. In proportion as education advances, a new and inexhaustible source of pleasure is continually unfolding itself to them; and their intervals of leisure instead of being devoted to low sensual indulgences or squandered in inaction and stupidity, will become fruitful in innocent pleasures and improvements.

Under these circumstances we recommend books to farmers. We think associations of the kind which we here notice, may be made eminently instrumental not only of direct improvement in the practical parts of the

art by inducing experiments and by the communicating of these experiments to each other, and by exciting a spirited emulation in an art and pursuit where rivalry and emulation can possibly do no harm; but also by leading to mental improvement; by stimulating intellectual and scientific inquiry, not only in all those branches of knowledge which bear either directly or indirectly upon the art itself, but in every thing which may contribute to the improvement, the consequent respectability and happiness of rural life. It would be therefore exceedingly desirable to connect with such an association a good social library of practical works, so that the members may be induced to read, may gratify their love of knowledge; and by storing their own minds with information from experiment, inquiry, and study, will be able to render such meetings interesting and instructive. These objects will be aimed at as we hope in this Westboro' association, and that in these respects they will present a bright and useful example to their brother farmers. We know there are men engaged in it who have an intelligent and just appreciation of the object of such an association which we have pointed out; and are not wanting in spirit to further these objects.

We hope we may be allowed to make one or two more suggestions. We say then let such an association be composed as it will of course be by the farmers of the same town, all neighbors and friends, be open to the women. Let them come in. They take an important part in our agriculture. The dairy business, the mill business, and the poultry yard belong immediately to their province; and it would be of the greatest importance if our country women could be made interested in every branch and operation of husbandry. To say nothing of the pleasure which they might find in such associations, the fact that women by reason of death or accident, are often left in the care of large farms, would find great advantages from such knowledge as they might here obtain or be induced to seek; and would in this way become much better fitted to be the helpmates of intelligent and enterprising men. We have the pleasure to know several admirable instances in the commonwealth, where women may be said to have made them selves thorough masters in this matter; and of some widows left with a numerous family of children dependent upon them, who have managed large estates which otherwise must have been sacrificed by a compulsory sale with excellent skill and success, and have thus kept their families together.

One more suggestion, which is, the hope that the Westboro' Society will provide annually for a town show, of live stock, of dairy produce, and of household manufactures. Wherever these shows have been introduced and maintained with spirit, they have been productive of the best and most lasting effects. But we have already extended these remarks much farther than we at first designed; and proceed to give the Constitution of the Society.

H. C.

PREAMBLE.

Impressed with the importance of the great improvements that may be made in Agriculture, and convinced that a society of agriculturists can more easily as well as more expeditiously than individuals, collect and distribute such information as cannot but tend to increase the product and improve the soil of our country—whose names are herewith subscribed, have associated ourselves (together with such others as may join in conformity to such rules of admission as are now or hereafter may be adopted,) into a society for improvements in agriculture, and to be governed by the following

CONSTITUTION.

ART. I. The association shall be known by the name of the "Agricultural Society of Westboro' and Vicinity."

ART. 2. The officers of the Society shall consist of President, two Vice Presidents, Secretary and Treasurer, and five Directors, who shall constitute a board to manage the affairs of the Society, and shall be chosen ballot.

ART. 3. The annual meeting shall be in Westboro' on the first Thursday of January, at one o'clock, P. M. the choice of officers and for the transaction of any business proposed by the Board of Directors. The stall meetings of the Society shall be on the evenings of the first Thursday in February, March, April, November and December. The President shall preside at all meetings, and in his absence or the absence of the Vice President, a President pro tempore shall be chosen.—In members shall constitute a quorum for doing business, and a less number may adjourn the annual meeting should there not be a quorum before three o'clock.

ART. 4. It shall be the duty of the Board of Directors to meet at least once in three months, to correspond with their Secretary with such societies or individuals as they may judge proper, and also to propose at any meetings of the Society, subjects for discussion, investigation or actual experiment.

ART. 5. It shall be the duty of the Secretary to keep a record of all the proceedings of the Society and of the Board of Directors, to take charge of all the books and papers of the Society until otherwise disposed of by their direction.

ART. 6. The Treasurer shall collect and receive all moneys belonging to the Society, and hold the same subject to the direction of the Board of Directors, and audit his accounts annually to the Society.

ART. 7. Any person on recommendation of any member at a previous stated meeting, and receiving the votes of two-thirds of the members present, and paying to the Treasury fifty cents, and signing the rules adopted by the Society, shall be entitled to all the privileges of membership.

ART. 8. No business shall be transacted at any meeting of the Society, after 9 o'clock, P. M., and no member shall be allowed to speak more than twice upon the same subject, at one and the same meeting, without liberty first obtained from said meeting.

ART. 9. No alteration or addition shall be made to its Constitution, unless proposed at a previous regular meeting, and the same mentioned in the notification for a meeting at which it is to be considered, and by a vote two-thirds of the members present.

OFFICERS OF THE SOCIETY.

President—LOVETT PETERS.
Vice Presidents—Ous Brigham, Nahum Fisher.
Secretary—George Denny.
Treasurer—James Leach.
Directors—Jonathan Forbes, Nathaniel E. Fisher, Elier Brigham, Samuel Chamberlain, Abijah Wood.

The exhibition of butter and cheese, for the splendid premiums of the Massachusetts Agricultural Society, took place at Quincy Hall on Wednesday last, the 4th inst. There were thirteen entries of butter and eight of cheese. None of the butter or cheese was of a quality, in the opinion of the Committee, to warrant the statement of the highest premiums, but gratuities are given to several individuals for butter and cheese, not of the highest order of excellence, of a very good quality hereafter.

The first distinction was given, for butter, to Wm. a-top of Barnet, Vt. 2d to Luther Chamberlain of Westboro. 3d to Daniel Chamberlain of do 4th to Richard Hildreth of Sterling.

For Cheese—The first distinction to T. Fisher of Burke, Vt. 2d to D. Lee of Barre. 3d to E. Field of Lew Braintree.

The prices of butter at the public sale varied from 23 3/4 cents, and of cheese from 11 1/2 to 13 1/2 cents.

BRIGHTON MARKET—MONDAY, Dec. 9, 1879.

Reported for the New England Farmer.

At Market 750 Beef Cattle, 275 Steers, 1300 Sheep and 450 Swine.

Prices—**Beef Cattle**.—We shall quote to correspond with last week; prices however were hardly sustained or a like quality. First quality, \$6 75. Second quality, \$6 00 a \$6 50. Third quality, \$4 50 a \$5 20.

Barrelling Cattle.—Mess \$5 50; No. 1 \$5 00.

Stores.—Yearlings \$9 a \$12. Two Year Old \$15 a \$26.

Sheep.—We quote lots at \$1 62, \$2 00, and \$2 62.

Swine.—A lot of selected barrows at 4 3/4; a lot of large sows at 3; a lot at 4; one entire lot to close at 3 1/2 and 3 1/2. At retail from 4 to 5 1/2.

THERMOMETRICAL.

Reported for the New England Farmer.

Range of the Thermometer at the Garden of the proprietors of the New England Farmer, Brighton, Mass. in a shaded Northernly exposure, week ending December 8.

SPLENDID BULBOUS FLOWER ROOTS.

Just received by JOSEPH BRECK & CO., from Holland, a very large and well selected assortment of Dutch Bulbous Roots, among which are the following—

HYACINTHS—Double white, double white with red and purple eyes, double rosy, double red, dark blue, light blue and yellow, single white, white with red and purple eyes, rosy, pink, red, light and dark blue, yellow and variegated, comprising 150 varieties of choice named sorts.

TULIPS—Fine late named sorts, fine double do, mixed single, mixed double, single and double Van Throff for forcing, *Pearls*, &c. &c.

CROWN IMPERIALS—Double red and yellow, single red and yellow, striped leaves, &c.

POLYANTHUS NARCISSES—White, yellow, white with yellow and citron cups, and citron with yellow cups.

NARCISSES—Orange Phoenix, Sulphur Phoenix, Incomparable, Van Sion, and *Tratus* canthus, with double flowers; Trumpet major, Sulphur and Poeticus, with single.

JONQUILLES—Double and single.

RANUNCULUS—Large double red and yellow Turkey, and other varieties.

ANEMONES—Many fine mixed and named varieties.

IRIS—English, Persian, Spanish and Sussiana.

CROCUS—White, blue, purple, yellow, cloth of gold, striped, &c. in 25 sorts.

GLADIOLUS—Bisantium communis, with purple, red and white flowers; Cardinalis.

LILIES—Double and single white, striped leaved, and spotted; Calcedonia, Buliferum, Martigon, Kamshaktian, Auratica, &c.

PROSIS—Double white Chinese, double red do, double red and double white, double purple fringed, funnel-faced, &c.

Also—**Show Drops**. Amaryllis, Tuberoses, Ornithogiluzums of all sorts, Arum draucum, Geranium tuberosum, Allium flavum, Hyacinthus non-strosus, plamosus, hiotriodes and Belgicus of sorts; Fritillaria, Cyclamens, &c.

The above choice collection of bulbs have been selected with much care, from one of the best houses in Holland, and are offered to purchasers with great confidence, believing they will give universal satisfaction to all who will give them a fair trial. Orders should be forwarded soon, to the subscriber, No. 52 North Market Street, office of the New England Farmer. A liberal discount will be made to dealers. October 23. JOSEPH BRECK & CO.

IMPROVED PIGS FOR SALE.

For sale three, improved Fairs of the following breeds; One half Berkshire and half Manky. One half Berkshire, quarter Macky and quarter Mocha. One half Berkshire and half a large English breed, name not known.

The above hogs are two years old; they are disposed of on account of keeping young sows of their get for breeders. They will be sold cheap if applied for soon. For terms, &c. apply to J. BRECK & CO. November 13.

BONE MANURE.

The subscriber intimates to his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of ground Bones, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel, put up in casks and delivered at any part of the city at 49 cents per bushel, and no charge for casks or carting.

Also, ground Oyster Shells. Orders left at the Bone Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

ROHAN POTATOES.

For sale at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, at 85 per barrel. October 16. JOSEPH BRECK & CO.

MISCELLANEOUS.

ANECDOTE OF A DOG.

A gentleman residing in Seville, had a dog named Carlo, and a fine knowing dog he was. His master who had much confidence in his prudence and discretion, not only employed him to bring provisions from the market, but also entrusted him with money to pay for the various articles commissioned. For a long time Carlo conducted himself in the most irreproachable manner, carrying the billet and money to the butcher's and conveying home a piece of beef or a fine fat piglet, as the case might be. Carlo continued to fill his situation in the commissariat to the entire satisfaction of the parties concerned: no fraud, no peculation, was ever laid to his charge; in short, Carlo showed by his daily conduct, that he not only knew the duties of a commissary, but what is still more remarkable he actually practised them. But alas! how many men in the midst of an honorable career may be tempted to make a false step—so it was with Carlo. Some shabby dog, it was supposed, had affronted him; he set down the basket, and while engaged in chastising his foe, an urchin peeped into the basket, seized the piece of money, and directly made off, without waiting to congratulate the victor. Carlo having sufficiently punished his adversary, shook his ears, and quite unconscious of the loss he had sustained, seized the basket with his teeth, trotted off to market in double quick time, and presented himself before the butcher. "How is this? there is no money here Carlo," said the butcher, after taking out the billet, and turning the basket upside down. For a few moments Carlo hung his head in evident confusion, and then as if a sudden thought had struck him, he rushed out of the market. Away he went helter skelter through the crowded streets, upsetting a Gallego with his water jar, bouncing against a seller of water melons, and running full tilt against an Italian pedlar, creating dire confusion among his saints and madonnas; on he went till he reached the square where a number of boys were collected and playing at pitch and toss. Here Carlo made a halt for a few minutes, until seeing a piece of money similar to the one that had been stolen from him, he pounced upon it and disappeared, to the great astonishment of its owner. Carlo went directly to the butcher, gave him the money, took up the well filled basket, and what is not the least remarkable part of the story, he returned home by a circuitous route, by which means he avoided passing through the square, having doubtless, reasons of his own for declining a meeting with the young gambler.—*The Sportsman*.

GRATITUDE.—The rector of the parish my friend lived in was a man who added to the income he derived for his living a very handsome private fortune, which he entirely devoted to the benefit of the poor around him. Among the objects of his bounty, one old woman, a childless widow, was remarkably distinguished. Whether commiserating her utter helplessness or her complete isolation, he went farther to relieve her than many, if not all, the other poor. She frequently was in a habit, of pleading her poverty as a reason for her not appearing in church among her neighbors; and he gladly seized an opportunity of so improving her condition, that on this score at least, no impediment existed. When all his little plans for her

comfort had been carried into execution, he took the opportunity one day of dropping in, as if accidentally, to speak to her. By degrees he led the subject to her changed condition in life—the alternative from a cold, damp, smoky hovel, to a warm, clean, slated house—the cheerful garden before the door, that replaced the mud-heap and the duck-pool—and all the other happy changes which a few weeks had effected. And he then asked, did she not feel grateful to a bountiful Providence that had showered down so many blessings upon her head?

"Ah, troth, it's thrue, for yer honor, I am grateful," she replied, in a whining, discordant tone, which astonished the worthy parson.

"Of course you are, my good woman, of course you are—but I mean to say, don't you feel that every moment you live is too short to express your thankfulness to this kind Providence for what he has done?"

"Ah! darlint, it's all thrue—he's very good—he's mighty kind, so he is."

"Why then not acknowledge it in a different manner?" said the parson with some heat—"Has he not housed you, and fed you, and clothed you?"

"Yes, alannah, he done it all."

"Well, where is your gratitude for all these mercies?"

"A, sure if he did," said the old crone, roused at length by the impertinence of the questioner—"sure if he did, *does't he take it out o' me in the corns?*"—*Confessions of Harry Lorrequer*.

Royal Economy.—When Charles VIII. of France, was once at Bourges, he ordered a pair of boots to be made for him. As he was trying them on, the intendant of his household came in and said to the shoemaker, "take away your boots; we can't afford a new pair yet; his majesty must wear his old ones a month longer." The king, it is said, commended the intendant for his prudence. Now-a-days, he would chance to be sent to Bedlam as a lunatic.

Comfort of Children.—Call not that man wretched who, whatever else he suffers as to pain inflicted, or pleasure denied, has a child for whom he hopes and on whom he doats. Poverty may grind him to the dust, obscurity may cast its darkest mantle over him, the song of the gay may be far from his own dwelling, his face may be unknown to his neighbors, and his voice may be unheeded by those among whom he dwells—even pain may rack his joints, and sleep may flee from his pillow; but he has a gem, with which he would not part for wealth defying competition, for fame filling a world's ear, for the luxury of the highest health, or for the sweetest sleep that ever sat upon a mortal's eye.—*Cateridge*.

Concise Criticism.—Sheridan had a very concise formula as a reply to the new publications that were constantly sent to him, viz.—"Dear sir, I have received your exquisite work, and I have no doubt I shall be highly delighted after I have read it."

Foote once dined at an inn where he was charged an enormous price for his meal, which led him to inquire the landlord's name. "Partridge, and please you," replied the host. "Partridge," resumed Foote, "it should be *Woodcock*, by the length of your bill."

Bank Failures.—The Augusta Age states on good authority, that in addition to the Washington County Bank at Calais, the Frankfort Bank at Frankfort, and the Medomak Bank at Waldoboro' have failed.

The value of Sons.—A short time since a man was heard lamenting the death of two of his sons "Two stout, hearty boys," said he, "and died just afore hain't time.—I'd rather gen nine shillings—its eny-most ondid me."

Grave Amusement.—The following introduction to a piece of poetry in a late number of the Spring field Republican, is quite novel to us: "The following lines were written more than sixty year ago, by one who has for many years slept in his grave, *merely for his own amusement.*"

A German priest walking in procession at the head of his parishioners, over uncultivated fields in order to procure a blessing on their future crop when he came to those of unpromising appearance would pass on, saying, "Here prayers and singing will avail nothing: this must have manure."

Complimentary.—An erratic poetical genius about town, was highly delighted the other day, by the editor's telling him he resembled Lord Byron. "D you really think so?" asked the moonstruck sonneteer in an ecstasy—"pray in what respect?" "Why, you wear your shirt collar upside down and get 'corn'd' on gin and water!"

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, Green's Patent Straw, Hay, a Stalk Cutter, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.

2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.

3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.

4. The machine is simple in its construction, made a put together very strongly. It is therefore not so liable to the complicated machines in general use to get out of order.

DOMESTICATED WILD GESE.

A few pair for sale. Enquire at this office. November 6.

GREENHOUSE GLASS,

All sizes and qualities, for sale by LORING & KUPPE No. 10 Merchants' Row. November 6. 2t

A RARE CHANCE.

For sale. A partner wishing to withdraw from a established Agricultural Implement and Seed Warehouse having a good run of country custom, would be willing to dispose of his interest on liberal terms, as he is about engaging in other pursuits. To a person wishing to engage a respectable and profitable business, having some real capital, it is an opportunity rarely to be met with. A liberal credit will be given on most of the purchase money if properly secured. Any communications addressed "Lafayette New York city, will be attended strictly confidential.

THE NEW ENGLAND FARMER.

Is published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay will sixty days from the time of subscribing are entitled to a reduction of 50 cents.

AGRICULTURAL.

ADDRESS

Delivered before the *Agricultural and Horticultural Societies of New Haven County, Sept. 25, 1830.*
By HON. JESSE BUEL.

[Concluded from page 198.]

In a late tour which I made through parts of New York and New Jersey, I found many evidences of recent improvement, and I doubt not similar ones bound in my native state. In a part of Dutchess county, which I visited, the best farms have been sold, within my recollection, with improvements and buildings, at from seven to seventeen dollars an acre. They cannot now be bought for one hundred dollars an acre; and one was sold last year at auction, without buildings, at one hundred and thirty dollars an acre. Fifteen years ago, a farm in western New York, of 400 acres, exhausted by bad husbandry, was bought by a Scotch farmer for \$4000. This farm has been so improved by good husbandry, that the owner was last year offered for \$40,000. He refused the offer, upon the ground that it actually netted him the interest of \$60,000, or \$10.50 the acre. A farm was pointed out to me in New Jersey, which was recently sold for \$1000 an acre, and that was all it was said to have been worth in its then condition. By a liberal outlay in draining, it being level and wet ground, and in liming, manuring, &c., it is now considered worth \$125 an acre. I went over another farm which a few years ago was bought at the same price, and which now, on account of the improvements which have been made upon it, is considered worth \$100 per acre. I am informed on the best authority, that similar cases of the rapid increase in the products and value of farms, consequent upon an improved system of management, are to be found in Pennsylvania, Delaware, and Maryland. Although these cases are isolated ones, they nevertheless serve to show the practicability of vastly increasing the value and products of our exhausted lands.

Among the causes which have essentially contributed to the deterioration of our lands, and the consequent depression of our agriculture, I consider the following as prominent:

Ignorance of the principles of agriculture;

The want of a sufficient outlay in the management of our farms; and

The low estimation in which the employment has been held by all classes, including farmers themselves.

Agriculture has too generally been considered a business requiring mere physical power, with which the principles of natural science had little or nothing to do. To plough, sow, and gather the crop, has been the general routine of farming operations, regardless of the poverty which our practice was inflicting upon the soil and upon our children. Like the reckless heir of wealth, we found ourselves in possession of a treasure; and without inquiring for what purpose it came into our hands, or realizing our obligations to husband and preserve it, for oth-

ers, we have squandered it lavishly, through our ignorance or our folly. True, we have been occasionally admonished of our error by the schoolmen; who, wrapped in abstract science, and knowing little of the practically of its application to husbandry, have as often tended to confuse and mystify, as to enlighten and instruct. Hence the prejudice which has arisen, against book-farming. But science and art are now uniting their labors, and are deriving mutual aid from each other, on the farm, as they have for some time been doing in the manufactory and in the shop of the artisan. A new era is dawning upon the vision of the farmer; new light is illumining his path, and a new interest and new pleasures are urging him on to improvement. He begins to study the laws which Providence has ordained for the government of improved culture, and he finds in their application to his labors, the means of increasing profits and high intellectual enjoyment. And the more he studies and is guided by these laws, the more does he become satisfied of former errors, and of his comparative limited sphere of usefulness. Science is probably capable of rendering more important services to husbandry than to any other branch of labor, and presents a wider field of useful study to the cultivator of the soil, than to any other class of society.

The deficiency in farming capital, or rather the stinginess with which capital is employed in improving and maintaining the condition of our lands, is another cause of declension in the profits and character of our agriculture. The farmer is too prone to invest his surplus means in some new business, or in adding to his acres, instead of applying them to increase the profits of his labor and the products of his farm. He either works more land than he can work well and profitably, or he diverts to other objects the means which would yield a better return if applied to the improvement of the farm. He is apt to consider twenty or thirty dollars an enormous and wasteful outlay upon an acre of land, or upon a choice animal; and yet the interest of this outlay will be ten times paid by the increase of crop or the increase of the animal; and in most cases the principal also will be returned to him in the course of two or three years. Many of the most thriving farmers in southern New York, New Jersey and Pennsylvania, make a quadrennial expenditure of twenty dollars or more to manure an acre; and it has become a maxim with them, that the more the outlay for manure, the greater the net profit of their lands. But it is not the outlay for manure alone, that demands a liberal expenditure of capital. Good seed, good farm stock, and good implements, are all essential to the economy of labor, and to neat and profitable farming. And I think it will appear from the cases I have quoted, that in many locations, capital may be very advantageously employed in reclaiming wet and marshy grounds, generally rich and the most productive when laid dry.

When our cattle grow lean, and threaten to disappoint our hopes of profit, we do not hesitate to impute the evil to the want of food, or to inatten-

tion in the herdsman. And if we are prudent managers we at once graduate our stock to our food, knowing that one well fed animal is of more value in the market, than two animals that carry but skin and bones, and take care that the food is properly fed out. When our crops become lean, we need not hesitate to ascribe the decrease in product to like causes—want of food, or want of attention in the farmer; and prudence and profit in like manner require, that our crops, like our animals, should be limited to the food and labor which we have to bestow upon them. In other words, an acre well manured and well worked, will be found to be more profitable than four poor acres badly worked.

I may be here asked, from whence are to be obtained the vast supplies of manure requisite to manure our old lands? I answer, from a multiplicity of sources around us—from every animal and vegetable substance within our reach. Nothing that has once been part of an animal or a vegetable, but can be converted into corn, grass, and roots. I think I may assume as facts, that upon an average, not half the manure is saved upon our farms that might be, and that this moiety is half lost before it is applied to the soil. Every horse, ox or cow, wintered upon the farm, if well fed, and littered with the straw, stalks, &c., of the crop, should make from six to ten cords of good manure. Dr Coventry, late professor of agriculture at Edinburgh, estimated that the straw of an ordinary acre of grain, computed at 21 cwt., may be converted by the urine and liquids of the stables and cattle yards, into three and a half tons of manure; that meadows that cut one and a half tons of hay, will give four tons of manure; clover, the first year, six tons, and the second year, five and a half tons per acre; and that with the extraneous substances which may, with due care, be collected without expense from the roads, the ditches, the ponds, and from refuse of every kind about the house and premises, the acreable amount should be amply sufficient for a full supply of manure once during every course of the four year system of husbandry. Arthur Young, with 6 horses, 4 cows, and 9 hogs, which consumed 16 loads of hay and 20 loads of straw, obtained 118 loads of manure, 36 bushels to each; and from 45 fattening oxen, well fed and littered, 600 tons of rotten manure. But an American lawyer,* and an excellent practical farmer withal, has gone beyond these estimates. I visited his farm a few weeks ago, which lies upon the sea shore. It consists of about 200 acres, most of which was in a course of crops. The crops of the season had all received an ample supply of manure, as their appearance indicated—and yet I was shown masses of well prepared compost, in reserve, consisting of yard manure, peat ashes, peat earth, sea weed, and fish—estimated at twenty-five hundred loads—all produced upon his own farm.

The third obstacle to agricultural improvement, which I propose to notice, is the subordinate rank to which this employment has been consigned, and to which the farmers themselves have contributed,

*W. A. Seelye, Esq., of Staten Island.

by a want of respect for themselves and respect for their vocation. The wholesome habits of society have been so broken up, by the civil and political convulsions of the age, and the inordinate thirst for acquiring wealth and fashionable consequence, through mercantile and other speculations, that honest productive labor has been thrown entirely into the background, and considered not only ungentle but menial and servile. Yet I venture to lay down this proposition, that he who provides for the wants and comforts of himself and family, and renders some service to society at large, by his mental and physical industry, performs one of the high duties of life: and will ultimately be rewarded in the conscientious rectitude of his life, by a greater measure of substantial happiness than he who makes millions by fraud and speculation, to be squandered in extravagance or wasted in folly, by his children or grand-children. The revolutions that are constantly taking place in families, sufficiently admonish us, that it is not the *wealth* we leave to our children, but the industrial and moral habits in which we educate them, that secures to them worldly prosperity, and the treasure of an approving conscience.

The farmers, I have remarked, share in the errors of the day. Not content with the gains which are ever the reward of prudent industry, and which might be greatly increased by the culture of the mind—nor content with one of the most independent conditions in society, hundreds and thousands of them seek other and new employments, and some of truly menial character, to get rid of labor, the greatest blessing to man, and to raise themselves in the imaginary scale of fashionable society. And if they cannot participate themselves in this imaginary greatness, (and it is seldom any thing more than imaginary) they are anxious to indict the evil upon their posterity,—to rear their sons to the law, the rail-road to office,—to political power and turmoil—to make them merchants, a useful but greatly overstocked business, or to place them in some other genteel employment, which shall exempt them from the toils of labor, the salt that best preserves from moral corruption.

Mistaken men! What class in society have within their reach so many of the elements of human enjoyments—so many facilities for dispensing benefits to others—one of the first duties and richest pleasures of life—as the independent tillers of the soil? "The farmer," says Franklin, "has no need of popular favor: the success of his crops depends only on the blessing of God upon his honest industry." If discreetly conducted on the improved principles of husbandry, agriculture offers the certain means of acquiring wealth, and as rapidly as is consistent with the pure enjoyments of life, or with the good order and prosperous condition of society. Agriculture is the golden mean, secure alike from the temptations of mushroom opulence, and the craven sycofancy and dependence of poverty. "Give me neither poverty nor riches," was the prayer of the wise man of Scripture, "lest," he added, "lest I be full and deny thee, and say, who is the Lord? or lest I be poor and steal, and take the name of my God in vain."

When we consider that agriculture is the great business of the nation—of mankind,—that its successful prosecution depends upon a knowledge in the cultivators of the soil, of the principles of natural science—and that *our* agriculture stands in special need of this auxiliary aid,—we cannot withhold our surprise and regret, that we have not long since established professional schools, in which our

youth, or such of them as are designed to manage this branch of national labor, might be taught simultaneously, the principles and practice of their future business of life, and on which, more than any other branch of business, the fortunes of our country, moral, political, and national, essentially depend. We require an introductory study of years in the principles of law and medicine, before we permit the pupil to practice in these professions. We require a like preliminary study in our military and naval schools, in the science of war and navigation, ere the student is deemed qualified to command.—And yet, in agriculture, by which, under the blessing of Providence, we virtually "live, move, and have our being," and which truly embraces a wider range of useful science than either law, medicine, war, or navigation, we have no schools, we give no instruction, we bestow no governmental patronage. Scientific knowledge is deemed indispensable in many minor employments of life; but in this great business, in which its influence would be most potent and useful, we consider it, judging from our practice, of less consequence than the fictions of the novelist. We regard *mind* as the efficient power in most other pursuits; while we forget, that in agriculture, it is the Archimedean lever, which, though it does not *more*, tends to *fill* a world with plenty, with moral health, and human happiness.—Can it excite surprise, that under these circumstances of gross neglect, agriculture should have become among us, in popular estimation, a clownish and ignoble employment?

In the absence of agricultural professional schools could we not do much to enlighten and raise the character of American husbandry, by making its principles a branch of study in our district schools? This knowledge would seldom come amiss, and it would often prove a ready help under misfortune, to those who had failed in other business. What man is there, who may not expect, at some time of life, to profit directly by a knowledge of these principles? Who does not hope to become the owner, or cultivator, of a garden or a farm? And what man, enjoying the blessing of health, would be at a loss for the means of an honest livelihood, whose mind had been early imbued with the philosophy of rural culture—and who would rather work than beg?

An early acquaintance with natural science, is calculated to beget a taste for rural life and rural labor, as a source of pleasure, profit, and honor. It will stimulate to the improvement of the mind, to elevate and purify it—to self-respect, to moral deportment: and it will tend to deter from the formation of bad habits, which steal upon the ignorant and the idle unawares, and which consign thousands of young men to poverty and disgrace, if not to premature graves. A knowledge of these principles, to a very useful extent, can be acquired with as much facility in the school or upon the farm, as other branches of learning. Why, then, shall they not be taught? Why shall we withhold from our agricultural population that knowledge which is so indispensable to their profit, to their independence, and to their correct bearing as freemen? Why, while we boast of our superior privileges, keep in comparative ignorance of their business, that class of our citizens who are truly the conservators of our freedom? I know of but one objection—the want of teachers. A few years ago, civil engineers were not to be found among us. The demand for them created a supply. We have demonstrated that we have the materials for civil engineers, and that we can work

them up. We have materials for teachers of agricultural science, which we can also work up. Demand will always ensure a supply.

The enumeration of the foregoing obstacles to agricultural improvement, sufficiently indicates the means which will be efficient in removing them.—The means consist, so far as I now propose to notice them—

1. In giving a *professional* education to the young farmer, which shall embrace the *principles* and the *practice* of the business which he is designed to follow in life—and

2. In diffusing more extensively, among those who have completed their juvenile studies, and are better fitted to profit by the lessons of wisdom and experience, a knowledge of the same principles and of the best modes of practice which these principles inculcate, and which experience has proved to be sound.

We have professional schools in almost every business of life, except in the cultivation of the soil, one of the most important and essential of them all, and one embracing a larger scope of useful study in natural science and in usefulness to the temporal wants of the human family, than any other. The policy of monarchs, and of privileged orders, has been to repress intelligence in the agricultural mass in order to keep them in a subordinate station. But neither the policy nor the practice should be countenanced by us. Our agriculturists are our privileged class, if we have such. They are our sovereigns, because, from their superior numbers, they must ever control our political destinies, for good or for evil. And the more intelligent and independent we can render them, the more safe we make our country from the convulsions of internal feuds, and the danger of foreign war.

I put the question to fathers—Would you esteem that son less, or think him less likely to fulfil the great duties of life, who had been educated in a professional school of agriculture, with all the high qualifications which it would confer for public and domestic usefulness, than him who had been educated for the counter, the bar, or other high professional callings? On which could you best rely for support and comfort in the decline of life? Nay, I will venture to carry the appeal farther—to the discriminating judgment of the unmarried lady.—Would you reject, as a partner for life, the student of such a college, coming forth with a sound mind, deeply imbued with useful knowledge, and a hale constitution, invigorated by manly exercise, whose cares and affections were likely to be concentrated upon home and country, and whose precepts and examples would tend to diffuse industry, prosperity, and rural happiness around him? The father's response would be, I think, an unhesitating *no*, to the first question; and the lady's, after due deliberation, I verily suspect, would be a half articulate *amen*. I pretend not to the spirit of prophecy, yet I venture to predict, that many who now hear me, will live to see professional schools of agriculture established in our land, to see their utility extolled, and to be induced to consider them the best nurseries for republican virtues, and the surest guarantee for the perpetuity of our liberties. They should be established—they will be established—and the sooner they are established, the better for our country.

To those who have passed to manhood, and who have made up their minds, from necessity or from choice, to till the ground, the means of improvement—of studying the principles of their business

—and of becoming acquainted with the most approved and modern practices in husbandry—the opportunities of acquiring useful knowledge are abundant and cheap. One of these means and a valuable one, is proffered him through the exhibitions and publications of these societies. Another is the perusal of books upon agriculture and rural economy, which should form a part of social and rural libraries. And another facility of acquiring this useful knowledge, is afforded by the agricultural periodicals of our country, which, besides containing much that is instructive in the philosophy of farming, are a record of the best modes of practice, and of much that is new and important, in the various departments of rural and household labor. A volume of the *Cultivator*, of which I can speak with accuracy, contains about as much matter as five or six volumes of the popular novels of the day, and twice as much as four numbers of our literary quarterly journals. The price of the *Cultivator* is one dollar per annum. I verily think, that if the farmer would divide his patronage between political and agricultural journals, he would be a manifest gainer, in his fortune and in his family—would be more happy in his business, and domestic in his habits—a better manager and a more useful citizen.

Time will not permit me to go into the details of modern improvements in husbandry. These improvements are great, and afford the brightest hopes to the philanthropist and the patriot. No one who can carry back his memory forty years, can withhold his wonder at the astonishing improvements which have in that time been made in the manufacturing and mechanic arts, by reason of the aids of science; and those who can scan the future, will have no less reason to rejoice, in the anticipated advantages which are in prospect, from an improved culture of the mind and the soil, consequent upon a better system of education to the agricultural population, and the general diffusion of useful knowledge, which is likely to result from it.

I will merely further remark to the farmer, that if he would prosper in his business, he should study practice, and adopt the better system of husbandry which is abroad in the land, and which has already greatly profited thousands, so far as his soil and circumstances will permit,—that he should drain his wet lands, economize his manures and apply them with judgment,—to cultivate well, what he does cultivate,—to alternate his crops,—to extend his root culture,—to increase and improve his stock, as the products of his farm will permit,—and to substitute fallow crops for naked fallows.

In conclusion, gentlemen, permit me to express my hearty wish, that success and honor may crown your efforts to improve the condition of your country, industrial and moral, associate benefits almost as intimately connected as cause and effect—and that you may long live to enjoy the blessings which are promised to him who truly loves his neighbor and reveres and worships his God.

SOUTH CAROLINA.

An Agricultural Convention, consisting of delegates from the various parts of the State of South Carolina, assembled at Columbia on the 26th ult.—The Governor, in his speech, recommends the adoption of measures by the Legislature for the improvement of agriculture, and particularly an appropriation for an agricultural survey. On this subject he says:

“It is a lamentable truth, that while other bran-

ches of industry have received an impulse, by wholesome laws, the great interests of agriculture have been passed by almost with silent contempt. It is now time for the State to dismiss from her counsels this cold indifference, and to take such action on the subject as will promote its success. In exploring the causes which have retarded the progress of the State in population, wealth and importance, none is more prominent than the utter neglect of this primary pursuit. It cannot be doubted that South Carolina once possessed a soil of unsurpassed fertility. But this rich gift of a kind Providence has been, in a great measure lost, by a most pernicious course of husbandry. A large portion of this once flourishing region, blessed too, with a propitious climate, has been reduced to sterility. Yet all hope of reclaiming and restoring to its wonted productiveness, our exhausted soil, is not in vain. It is a beneficent provision of a good Providence, that beneath the surface of the earth are to be found substances of the most fertilizing qualities. Their discovery, however, requires the application of science, and means seldom possessed by individuals. It is in such a case, that a wise and patriotic Legislature should extend its aid. But to subserve fully the interests of Agriculture, the Legislature should not confine its operations to a Geological Survey alone. With this, should be connected an Agricultural Survey. While the former would bring us acquainted with all the substances which enter into the composition of that portion of the earth to which we can have access, the latter will elicit a mass of information in relation to every thing that concerns agriculture, which cannot fail to be highly useful. In other countries, the utility of agricultural surveys has been fully proved, by the valuable results. But in carrying into effect such surveys, as have been mentioned, the value of the results would depend upon the selection of an individual possessing the highest qualifications, combining a profound knowledge of the subjects of investigation, a sound discriminating judgment, and an untiring zeal and industry. The expense of such a project should not be weighed against the incalculable importance of the end proposed. Being deeply impressed with the practical usefulness of such surveys, I earnestly recommend that you provide for their accomplishment.

The following are the Governor's remarks on the subject of Education.

But while the development of the physical resources of our country should claim so large a share of your serious attention, popular education ought to hold the first place in your estimation. It is knowledge, intellectual, moral and religious, that constitutes the man. Without its possession, wealth would be a curse, instead of a blessing. Besides, the stability and permanence of our republican institutions, have their own guarantee, in an intelligent, moral and religious population. Hence this important subject has commanded the warmest regard of those who have preceded us. The establishment of the College, and the adoption of the Free School System, are enduring monuments to the memory of those by whose sagacious efforts they were brought into existence.—The former, from small beginnings, has risen to a proud eminence among the literary institutions of our great confederacy, and is annually sending forth a band of well-educated youths, the future glory and ornament of their country; the latter, although based

upon the soundest principles of a free Government, has not yielded all those benefits which its intrinsic excellence so justly deserved. At your last session, commissioners were appointed, in every election district of the State, to examine and revise the Free School system, and to report to the Executive such amendments or alterations, as they might deem useful. Many of these commissioners, with a very commendable zeal and ability, have discharged the important duty assigned to them, while others have failed to make reports. In obedience to your resolution, I have placed the reports which have been made, in the hands of a commission of two gentlemen, Professors Elliott and Thornwell, to be examined by them, and a system to be devised, and submitted to you, at the present session. Their report, as soon as prepared, shall be transmitted to you, with the reports of the district commissioners.

It affords me unfeigned pleasure, to announce to you, that the College continues to answer the high expectations of the State. It is rapidly advancing in a career of prosperity and usefulness, which must redound to the lasting benefit of the country. It steadily increases in numbers, although the standard of admission is higher than formerly. I ardently recommend this noble institution to your paternal and fostering care. The State can only expect to maintain its wonted high character, by an enlightened population, well grounded in solid learning, and a lofty moral elevation.

A Rule worthy of the Farmer's attention.—A most important axiom to be kept in mind by every farmer is, to break up and cultivate no arable land to be laid down again with depreciated strength; in other words, no crop requiring the plough or cultivator and hoe should be put into the ground the present year which will leave the ground in a worse condition than it was before the work was begun. It will, when adopted as a principle, be very easy for every farmer to make his calculation in any crop requiring the hoe, so to improve the capacity of his land that it shall yield more than it has done before. A plenty of good barn yard, hog yard, stable or compost manure will effectually do this business on almost every retentive soil: in some cases of low and wet grounds, the simple application of sand or gravel with a small quantity of the stimulating manures will accomplish every thing to be wished: in other cases of sandy, porous soil, the application of clay or other adhesive earths, with the free use of plaster of Paris and some stimulating manures, will do wonders. The observance of the principle of constant renovation will soon bring New England to rank with the best cultivated districts of England and Scotland, and even with the still higher improvements exhibited in Flemish husbandry.—*Gov. Hill's Address.*

Value of Salt.—An increased quantity of salt used by the farmer in various ways would be of eminent benefit. Salt ought to bear a less price than it now does throughout the country. Much of the expense of salt is in the price of transport: it is a taxed article, and assists in the revenues of the government. I am confident that fine salt sprinkled over the ground in the quantity of three or four bushels to the acre will not only contribute to drive off insects and other destructive vermin, but in most vegetable crops will prevent blight. A sprinkling of salt in the feed of most animals will contribute to their healthy growth.—*Ibid.*

For the New England Farmer.

LABOR AND LABOR-SAVING MACHINES.

We conceive that many American writers, in urging the adoption of foreign agricultural improvements, overlook one very important ingredient in European farming, essential to a high standard of husbandry, and that is the extreme low rate of wages abroad compared with what it is in this country. In the old and fully-peopled countries of Europe, is a large surplus population, incapable of being landholders, or entering into commerce and the trades, from the arbitrary rules that govern them, and who must content themselves with the smallest daily pittance or starve. Such a population is more at the disposal of the farming than any other interest in society, and is one of the main pillars of the high and improving state of English, Scotch, and French agriculture. With us the farmer has no such resource. Ours is a new country, and, from the freedom and elasticity of action engendered by our institutions, and the inducements held out to exertion, all are striving to outstrip each other in the acquisition of wealth and reputation. Land is cheap and abundant, and there is ample room for action; and every man who has a common degree of intelligence and industry, may become a landholder. Men follow their natural inclinations, and prefer being independent citizens and their own masters, to being in the employment of other individuals. Under this state of things, those pursuits that are carried on with much manual labor, are attended with the most expense to those engaged in them, and meet with no small obstacle to their success in the fact, that they create a demand, for which the supply is by no means adequate. American farming is one of these pursuits; its various operations being almost entirely performed by bodily labor, unassisted in a great degree, by nature or art. To every pursuit and profession among us have the sciences and arts lent more assistance than to our husbandry; and we believe that this is one very great reason why all other pursuits are so much in advance of it. The innumerable results of human invention, the application of the laws that govern the operations of nature, to the daily avocations of man, have carried us forward with an incredible rapidity as a commercial and manufacturing people. They have been capital and labor to us, amply supplying the deficiencies of both.

Amid this hurrying forward to perfection of almost every calling amongst us, we would not say that our agriculture remains where it stood fifty years ago, for we believe it has advanced within that period—but we find it creeping on at a comparatively snail's pace unassisted, in a great measure, by art or science, and harassed by the same impediments, that hampered it in the days of our fathers. We speak, of course, of the general state of American farming, as manifested throughout the country, and would not include those exceptions in districts and individuals, that, from their rarity, do us the more honor.

With nothing have our farmers had to contend more than this scarcity of labor we have referred to. The high rate of wages has eaten up the profits of the farm, and debarred them from making many improvements in their husbandry; and this the more so, inasmuch as the raising of crops for the market, requiring much and constant manual labor, has been the prevailing agricultural interest. This obstacle to their more rapid improvement and success has been so prominent and palpable, that we have

often wondered at the neglect and indifference manifested by many of our farmers towards those implements and machines that have been offered them from time to time, for abridging and facilitating the labors of the farm.

Husbandmen should remember that just in proportion as they save in the *time of performing* their daily operations, just in the same proportion do they economise in the item of labor, and in the expense incurred by it. As for instance, if my two hired men, at the expense of a dollar a day apiece, can thresh with the flail, one hundred bushels of grain in ten days, the threshing of my grain will have cost me *twenty* dollars, taking no account of the inevitable loss by waste. Now if by the use of a threshing machine, at an expense say, of two dollars per day, with the assistance of a man and a boy at one dollar and a half per day, my one hundred bushels of grain can be threshed in two days, it will be done at an expense of *seven* dollars instead of twenty, with a gain also, of *eight* days time. We presume the items in this estimate are incorrect, but we believe the difference in time and expense will not be found to be much exaggerated, and will serve to illustrate our proposition, that *whatever is saved in the time of performing the daily operations of the farm, is so much gained in the wages of labor.*

We advance another proposition, that, not only so, by the use of labor-saving machines, economise in time and the expense attending labor, but also that *just in proportion as we economise in those two items, just in the same proportion does the same amount of capital go further in the cultivation and improvement of the farm.* If I have twenty dollars to pay for threshing one hundred bushels of grain by the flail in ten days, and can, by the use of a threshing machine, have the same amount threshed in two days for seven dollars, I have actually gained eight days and thirteen dollars, which I may spend in other duties upon the farm, or, which is the same thing, I can with the same amount of capital, perform nearly three times as much labor in three quarters of the time.

We would suggest then, on the strength of these two propositions, that, by the aid of labor-saving implements, our farmers may perform the usual labors of the farm at a much reduced expense, and, with the same outlay of capital, may also accomplish a very much increased amount of labor, and consequently an increased production. We know that it will be objected, that this appears very well upon paper, and may accord very well with a closet calculation, but that we have omitted to take notice of the item of the *first expense* of all machines, more particularly those of modern invention, and of the constant wear-and-tear attending their operation. We have made a liberal allowance for all this in the two general propositions we have advanced—the more liberal, inasmuch as wherever labor-saving machinery upon farms has come under our notice, the expense of purchase and repairs has been more than amply made good by the expense saved in the wages of hired men, by the superior and expeditious manner in which the various operations of the farm have been performed, and by the greater amount accomplished.

Our limits will allow us to record but one instance of the successful employment of labor-saving machinery upon farms, and there is no feature in the farming in the instance referred to, that we more admire than the manner in which art and science are made to supply the place of several pair

of hands. We will only say that the gentleman referred to is one of the most intelligent and distinguished farmers in the State of New York, whose *practice* as well as his experience and opinions, may be most confidently relied upon. Our friend, in the first place, has upon his farm a portable *horse-power*, a machine in too common use to need a description, and which, by the medium of the wheel and band, is capable of giving motion to machine for various purposes. In connection with this power, he employs a grain thresher, (of whose invention we do not recollect,) by which his grain is threshed in a third or quarter of the usual time, with scarcely any of the waste attendant upon the use of the flail, and which, when he is not using it himself, is passing from farmer to farmer to expedite their operations. By the aid of the same horse power applied to a simple circular saw by means of a band and wheel, he is enabled to effect the cutting of his winter's fuel, in a very few days (we had almost said *hours*), without any of that waste of chips that, in a series of years makes no small item in the farmer's economy. The same band and wheel transferred to his grindstone, and a pair of hands are saved at the crank, while by the increased power and velocity, two can be employed at the stone with greater ease and expedition than once could be by the aid of the common handle. The power obtained by the wheel and band, again transferred to his hay and straw cutter, and a couple of hours work prepares cut feed for a stock of twenty head for several days, and thus brings into successful operation a machine, that has not been in general use for a large stock of cattle from the great length of time required to cut the food by manual labor. By the use of the horse-rake, he contrives to save the labor of several hours and men in raking his level lands, and by a simple machine, we believe of his own construction, he plasters an extent of land in a few moments, that would require an hour or two to pass over, if the plaster should be sown by hand. Indeed he forces machinery to perform for him every operation on the farm, whereby he can save *time* and *wages* paid to hired men,—a system which he finds more expensive than the old-fashioned method of entire hand labor at the onset, but infinitely, *infinitely* more economical in the end.

And now when we ask ourselves how many of our farmers will be convinced of the truth of what we have said sufficiently to practice upon it, we find but a discouraging answer in our observation upon the prevalent systems of husbandry about us. When we urge the adoption of improved agricultural implements and labor-saving machines, we are met with excuses of a want of capital to meet the first expense,—of an inability to use successful implements and machines, from their complicated character,—and of a want of confidence in all improvements in agricultural implements, from the repeated instances of quackery under which they have suffered, in the numerous machines that have been palmed upon them as useful inventions and which turned out to be mere *clap-net*. In reply to all this we can only say, begin on a small scale, but do not be *afraid* to venture. Whether it be a horse-rake, or an improved plough, or what not, incur the *first expense*, and its use will repay you four-fold. Be not alarmed because the dollar you invest to-day will not return to you to-morrow, but be contented to wait, if there is any reasonable hope that it may come back to you at a more distant day trebled or quadrupled. And remember when you purchase, that the object of all improve-

farming tools or machinery, should be to perform, in a given time, a *greater amount* of work in a more *thorough and economical* manner, than the implements for which they are substitutes. With this object in view, purchase the most simply constructed machines, and neither condemn them or be discouraged because after a few trials they do not fulfill your expectations. Let them be *well* tested, and every attempt made to discover the cause of failure before they are given up. Be careful that this cause be not in the employer rather than the machine. And the farmer's well known intelligence and caution must be his protection against the employment of machinery or modes of farming of any sort, that are of doubtful utility. By placing a proper degree of confidence in the experience and opinions of those who have fairly tested various farming instruments, and by exercising his own judgment critically, there is no reason why the farmer more than any other man, should be the dupe of useless inventions.

We have already extended our remarks to a greater length than we had intended. But the importance of the subject must be our apology, and we shall be content with having drawn any to an attentive consideration of what we have said, and the various conclusions to which our suggestions may lead. H. V.

Greenfield, Nov. 30, 1839.

From the New York Observer.

DR. HUMPHREY'S THOUGHTS ON EDUCATION.

Qualifications of Teachers.

(Continued.)

Every schoolmaster, I have said, should be a man of good, plain common sense—should be well educated himself—should be apt to teach—should be a man of good temper and entire self-control, and should possess the faculty of governing his scholars, so as to gain their affections, at the same time that he secures their implicit obedience.

My next remark is, that he ought to have a particular fondness for teaching. This remark is founded on a very important general principle, viz., that in every employment, other things being equal, men succeed best in what suits their taste. One man has a talent, or genius, if you please, for painting, and another for architecture; one has a taste for mathematics, another for languages, and another for the natural sciences; one is enthusiastically fond of poetry, and another of music; one has a natural turn for mechanics, and another for the independent and invigorating pursuits of agriculture, and as a matter of course, every man will betake himself more cheerfully and successfully to whatever he has a taste for, than to any thing else. It often happens that persons from mere fondness for their profession, trade or employment, excel others who are greatly their superiors in abilities and achievements.

It is as desirable, and almost as necessary, that men should be *born* schoolmasters, as poets, musicians and painters. If a person loves to teach, loves to be surrounded from morning to night, by a group of young immortal beings, whose minds are continually expanding, and loves to watch their progress in all the elementary branches of education, his task, which to another might be insupportably irksome, will be pleasant; the thousand little annoyances and perplexities which every teacher

must meet with, will scarcely be felt; the time will be too short for his daily exercises; his engagement will expire ere he is aware of it; and great as may have been his toil, he will close the school with regret. Such a teacher, when his other qualifications are respectable, will be almost sure to succeed anywhere. Every body will see that he is seeking not his own ease and emolument, but the good of his pupils: he will infuse something of his own enthusiasm into their minds; the confidence of his employer will be secured, and all things will go well. But on the other hand, if the schoolmaster whom you employ would never teach another day if he could help it—that is, if he could do as well for himself in some other way; if his grand object is to get so many dollars a month; if he had rather begin every morning a few minutes too late than too early; if the time hangs heavy upon his hands, and he puts his watch often to his ear, and wonders when it will be noon; if the greatest interest he takes in the children, is to send them back every night to their parents; if he spends more thoughts in contriving how he shall get through the winter, with the least amount of labor to himself or with the least interruption to some ulterior object of pursuit; or if he tries to be faithful merely in obedience to the dictates of conscience, while his heart and his flesh are all the while crying out, O what a weariness, what a weariness! if, in fine, he has no real fondness for teaching, but rather an aversion, let him not thrust himself into a place which might be better filled by another. Let him find something else to do, which he likes, if he can; and if he cannot, it is better to betake himself *reluctantly*, if he must, to almost any other employment for a livelihood than to school-keeping.

Another prime and essential qualification in a schoolmaster, is *good principles*. In all ordinary cases, when we are about to confide any of our interests to a third person, one of our first questions is, can we trust him? Is he honest? Will he be faithful? And we are the more particular and anxious in proportion to the value of the stake.—Now what higher responsibility can a parent devolve upon another, than the right moral direction of the minds and hearts of his children? Next to the parent, certainly no one has so much influence over the child as a popular teacher. The chair which he occupies is his throne. His word is the law, to which all his juvenile subjects implicitly bow. He holds their whole moral destiny, as it were, in his hands. What he believes they believe. What he says they repeat. If he is a man of high moral principle, they will soon find it out; and they will be ready to embrace whatever sentiments he expresses, because they love to admire the man. Even when he takes no particular pains to mould their characters, there will go out from him a silent and pervading influence, which will be none the less potent, for being unseen and unsuspected. The price of such a teacher is "above rubies." Many, in after life, will "rise up and call him blessed."

But suppose him, on the other hand, to be a man of loose and depraved moral principles—a plausible and insinuating infidel, or a bewildered and vacillating skeptic. Suppose he disbelieves, or even doubts the truth of the scriptures, or the certainty of future rewards and punishments. Is such a man fit to keep school? If he had the talents of a Voltaire, or a Bolingbroke, would you employ him? Would any thing tempt you to expose your children to such a deadly influence, for a single month? Some may suppose, that it is a matter of but little

consequence what a schoolmaster believes, provided he keeps it to himself. But if his principles are bad, are corrupt, or merely of the Galileo school, will he keep them to himself? *can* he? Did you ever know a cause without an effect? He may not think it expedient to disclose his principles—he may even take pains to conceal them; but he will find it extremely difficult. The moral perceptions of children are as instinctive as they are inexplicable. They cannot be every day under the care of a teacher, even for a short time, without almost reading the "thoughts and intents of his heart." And besides all this, so long as our children are depraved, and so much more susceptible to evil than to good influences, they will imbibe contagion, where no moral test can detect it, and yield unconsciously to the power of elective affinities, which it may be impossible ever to dissolve. Would you plant the *barberry bush* in your wheat field, or the deadly *apoc* under your nursery window? Would you pay any one for planting them, or even suffer it to be done for nothing? And can you wittingly expose the tenderest part of yourselves to infinitely greater hazards in the school room? No. If the highest intelligence, "ruin'd," were to "transform himself into an angel of light," and you could be sure he never would disclose his true character, but would immeasurably excel all other teachers, in every branch of instruction, you would shudder with horror at the bare thought of employing him.

(To be continued.)

MORUS MULTICAULIS.—A few days ago a countryman from Bucks county came into the Northern Liberties, with his wagon loaded with Multicaulis trees, thinking he could sell them, as he had last fall, for a good price. As he neared Callowhill street, the boys gathered, mobbed him, and dozens at a time shouted "hurrah for Multicaulis!" and repeated the shout as often as fresh reinforcements arrived, until the street was filled. The countryman finally got permission from the owner of a vacant lot, to throw his *very valuable* load on it, and drove off in a full trot, leaving his tormentors to amuse themselves with multicaulis switches. The poor fellow had seen the *humbig Swantonian sale*, as published in the multicaulis papers, S. C. Socy's Journal, Baltimore Silk Manual, &c. &c., all of which papers were got up by the *patriotic silk society* to gull and delude the unsuspecting and ignorant farmer, to obtain a dollar for a tree which can be raised for one cent, with profit.—*Philad. Ledger.*

"Association, even where only two or three are gathered together," is more potent than individual effort alone: the experience of several collected is better than the experience of one. Where much time is not consumed—where too much expense is not incurred—where the shadow is not grasped for the substance—where a passion for extended experiments does not outstrip and leave common sense behind—we may expect to derive much benefit from the efforts of agricultural societies. There are counties and districts of New England much indebted to them for the superiority which they have attained. Berkshire in Massachusetts, was the first to institute, and has been the longest to persevere in her agricultural society: her mountain region can find at this time no superior in the United States in fertility and production. Ten thousand fleeces are taken from her hills, and her valleys groan with their crops.—*Gov. Hill's Address.*

NEW ENGLAND FARMER, AND HORTICULTURAL REGISTER.

BOSTON, WEDNESDAY, DECEMBER 18, 1839.

AGRICULTURAL MEETINGS.

The pleasure which was afforded by these meetings the last winter, during the session of the Legislature, the information which they elicited and dispensed, and the increasing interest which seemed to be taken in them, as the close of the session approached, all serve to recommend a renewal of them the ensuing session. The Commissioner therefore designs immediately after the commencement of the session, to make application for the use of the Hall one evening in the week, which he cannot doubt will be readily granted for this purpose; and he hopes the farmers in the Legislature will condescend to second these efforts. Success must depend on them. He hopes likewise that those of them who have valuable or unusual products of any kind of which samples may be easily transported, will bring such samples for exhibition.

Various questions will come up for consideration; and among others, several gentlemen have suggested for inquiry the expediency of holding annually a State Agricultural Convention, during the session of the Legislature. We shall express no opinion on this matter farther than to say, that it is deserving of much attention; and we shall take an early opportunity to offer it for the consideration of the meeting.

It will be refreshing and pleasant to turn aside once a week from the turmoil and vexation of party politics, and topics which seldom fail to produce angry and resentful feelings, and pass an evening in inquisitorial and conversation upon the topics which have no tendencies to engender strife, and whose great object is to make the condition of mankind more comfortable, prosperous, improved and happy.

H. C.

SCIENCE IMPORTANT TO THE FARMER.

We have received from our valuable correspondent W. B., in the absence of Mr Colman, the following communication, containing not merely remarks, but an essay on the importance of education to the farmer. The article presents many truths clothed in an original, beautiful, and sometimes highly poetical manner. We would call the attention of our readers, especially the farmers, to its perusal, requesting them to reflect upon its contents. We feel confident that every farmer who loves his noble calling, will unite with us in thanking W. B. and requesting him to continue his remarks. J. B.

MR COLMAN—We have just returned from listening to a sermon on education, a subject which very properly comes within the province of the divine as well as the civil and philanthropist, inasmuch as knowledge throws a charm around the beauties of religion, and fits men for higher and purer joys in the future, as it renders them more useful and happier in the present world. We must confess that we were astonished and somewhat disgusted, by some sentiments advanced, such as that it is no disparagement to farmers if they cannot solve a problem in Euclid,—that their time need not be spent in reading Latin and Greek, and that natural science need not claim his attention. The ideas communicated were strong and full, that if the farmer knew enough to trudge through life in his profession, and the mechanic to manufacture his wares, their cup of knowledge was full!! and this from the lips of one who justly discovers all zeal in the education of his own family.

Now we have no idea that the time has come in our American Israel, when mankind are to be divided off into castes, unless merit and demerit draw the line, and that knowledge is to be circumscribed in its operations, shedding its beauties with sunbeam brilliancy on one part of community, and shining through a cloud darkly, if shining at all, on the other. It cannot be while yet the dying groans of pilgrims are upon our ears, and the blood which was spilt in the revolution is still fresh before our eyes. If so, we may soon see our temples prostrate, through the influence of error, and all the glad prospects of a coming future, which our wise men so gladly hail, crumbled to the dust.

Man was created in the image of his God. He was sent to earth an innocent, intelligent being, and a farmer. When the Creator had looked upon the last and noblest specimen of his handy work and "pronounced it good," he gave him special injunction to "dress the earth and keep it," and he gave him dominion over the fowl of the air and over the fish of the sea, "and brought unto him the fowls and beasts of the field, and he named them," probably according to their ranks and orders; yet as his was then the only language of earth, it is not probable that he gave them names in all languages as we do, for the benefit of all nations. Yet the naming of them, was probably as scientific an operation as the dividing of them into classes, orders, &c is now. Hence we can form no other conclusion, than that Adam was a farmer, and a scientific one. But like some modern farmers, he ventured upon an uncertain speculation, which resulted in most disastrous consequences, involving himself and "his heirs and assigns" in difficulties beyond their power of extinction. His patrimony which was amply sufficient to have afforded all of his posterity a homestead where each of them might have pursued his heaven-appointed calling, was forfeited, consequently new professions must be created for the benefit of his sons, and as the earth was doomed to send up thorns and thistles, mingled with its more valuable productions, many of them soon learned to avoid its cultivation.

Agriculture, then, was man's employment in the days of his innocence. All other professions came in consequence of his apostasy. Death was decreed as his inevitable doom, and sickness and pain became its sure precursor. The physician was appointed to offer remedies for the evils to which he had justly become an heir. Sin had sown tares and thorns and thistles in his heart, and the divine was sent as a messenger of mercy, to pluck them out, and point his dejected soul to light and happiness on high. Through man's perversion, laws must be enacted to restrain his wayward steps, and litigation gave rise to those who professionally would see justice secure the rights of all. Other professions were originated, as circumstances required, and others yet will continue to burst into existence, as man advances in a social and refined state. All professions, therefore, are succeeding and subservient to that of the farmer. He might pursue his calling, though in a most imperfect manner, without their aid; but were his art annihilated, theirs must follow in the train, and man would become a fugitive and a vagabond on the earth—a savage, barbarous being.

But it is needless for us to dwell upon the antiquity or necessity of agriculture. We would rather, by simple detail, give convincing proof, that in order to its perfect success, its operator should possess an eminent quantity of common sense and a thorough scientific education. For our last assertion, we are aware we have exposed ourselves to a nest of hornets about our ears. But what then? We may as well be stung to death as to be trampled down; and notwithstanding the argument of "old men, and men of renown," that our fathers have planted and sown successfully and have filled their barns and storehouses abundantly, without this aid about newspaper and book farming, we would still with the brow of an Atlas reiterate it, and we wish we could make the nations hear and believe our sentiments,—farmers should be men of extensive professional reading, of sound practice, (not simply theorists,) of scientific education, from the fact that their profession involves a greater amount of science than any other. All nature, the rolling sun and changing moon, the air, the ocean and the earth operates in subservience to his success, or in their varied movement, counteract his designs. The frost and the storms, the gentle rains and roaring floods, the rattling

and fleecy snow, in their appointed seasons, affect his interest. A knowledge of them must, therefore, contribute essentially to his success.

It is a well known fact that the sun is the great regulator of seasons; that through his influence spring sends forth its lovely enamellings, and that summer and autumn load the earth with their rich harvest; that in consequence of his absent journeyings, winter exercises his tyrant sway, and binds the earth, the river and the little rivulet in fetters of frost, which, as they loosen their hold, break the soil and loosen it to receive the warm influences of returning sunbeams, and to allow the grass and tender herb to shoot their sustaining roots abroad. Sunshine also regulates the atmosphere, and prepares it to receive the exhaling vapor until it congregates in clouds and descends in soft showers upon the thirsty earth. Does not science, and would it not more effectually, if better understood, tell us how and why these operations are performed, and enabling us to some extent to guard against the future, in less matters than months and seasons, by watching his appearance?

The time has been, when great dependence was placed upon the age of the moon in regulating the affairs of husbandry, most of which have been denounced as the errors of a dark age. We have no idea of taking the grains into the moon to sow, or of driving hogs or bees there for slaughter. "T would be a very inconvenient process. Nor do we believe that the moon in any of her phases, would, without concurring causes, produce seed-time or harvest, or cause a single spire of grass to spring up in the midst of desolation. Yet we do believe that (perhaps in connection with other causes) it has its influence upon the atmosphere as well as upon the ocean, and that its influence extends to some degree to plants and animals, and that by watching its phases and place in the heavens, evils of sad nature to the farmer may be avoided, and benefits achieved. This may be called the work of observation, but science aids us in determining beforehand, what observation can only confirm.

The atmosphere has a direct influence upon agricultural operations, for in its bosom the storm is gathered and the whirlwind chained, and ere they are loosed, there are signs in the sky which sound their approach, and by the science of aëology we are often led to anticipate coming events at least for the day and the morrow, which may offer much "of weal or wo" to his labors and interest.

Old ocean, too, though restricted to bounds which it cannot pass, often in the midst of a calm announces the coming storm, or raises its pestiferous breath, and "sends blasting and mildew over the land." Though its effects must necessarily be most felt in its vicinity, they often extend themselves into the interior. That its good effects may be appreciated and its bad ones shunned, a knowledge of "its laws, manners and customs" may very properly be investigated.

The earth and all that is therein and what dwells upon it, and grows out of it, must necessarily, as it is the great field of his operations, present a field, urging his investigation. And here several distinct sciences demand his attention, in proportion as he would have success crown his efforts. A knowledge of them as also of those which have been named, may indeed be thought unnecessary, since multitudes have gone before him without so much as inquiring into them, and this with much apparent success. But it does not appear what the farmers of other ages would have been, had they been men of sound practical science. This, however, we do know, that wherever ignorance and intelligence plough and sow side by side, nature dispenses more liberal rewards on the latter.

Yours, truly,
W. B.
Mount Osceola, Dec. 6, 1839.

Massachusetts Horticultural Society.

EXHIBITION OF FRUITS.

Saturday, Dec. 7, 1839.

The specimens of fruits exhibited this day were as follows:

By the President, fine specimens of *Ester Beurre*, *St Germain*, *Turkish Bon Chretien?* and one sort of *Pears* not named.

The above were exhibited last week.

By T. Lee, Esq., Jamaica Plain: two specimens of *ears*—fine—not named.

By M. P. Sawyer, Esq., *Passé Colmar* and *St Germain Pears*—excellent specimens. Also, fine specimens of *Sylvanche Vert*, *Pear*; also, specimens of *Apples*, viz: *Bellflower*, a *Sweeting* from New York, and one from Newbury, not named.

Nath'l Dorr, Esq., of Roxbury, presented specimens of the "*Wild Fig*," brought by him from Michigan—it did there to be a very pleasant fruit. The seed of this is distributed among the members for trial here.

For the Committee,

JAMES L. L. F. WARREN.

VEGETABLE CUTTER.

Willis's New Improved Vegetable Cutter. This machine is calculated for cutting up vegetables and esculent roots for fodder, and is one of the most useful and economical machines that the farmer can use. The subscribers feel great confidence in recommending this machine to the public; they are aware that it has been long wanted and they now offer a machine that cannot fail to give satisfaction upon a fair trial. It will cut with ease from one to two bushels per minute, in the best possible manner, and is not liable to get out of order, being made in the most substantial manner. No farmer should be without one of them. For sale at the Agricultural Warehouse, 51 and 52 North Market Street, December 18.

JOSEPH BRECK & CO.

GREEN'S PATENT STRAW CUTTER.

JOSEPH BRECK & CO. at the New England Agricultural Warehouse and Seed Store, Nos. 51 and 52 North Market Street, have for sale, *Green's Patent Straw Hay and Stalk Cutter*, operating on a mechanical principle not before applied to any implement for this purpose. The most prominent effects of this application, and some of the consequent peculiarities of the machine are:

1. So great a reduction of the quantum of power requisite to use it, that the strength of a half grown boy is sufficient to work it very efficiently.
2. With even this moderate power, it easily cuts two bushels a minute, which is full twice as fast as has been claimed by any other machine even when worked by horse or steam power.
3. The knives, owing to the peculiar manner in which they cut, require sharpening less often than those of any other straw cutter.
4. The machine is simple in its construction, made and put together very strongly. It is therefore not so liable as the complicated machines in general use to get out of order.

BONE MANURE.

The subscriber informs his friends and the public, that after ten years experience, he is fully convinced that ground bones form the most powerful stimulant that can be applied to the earth as a manure.

He keeps constantly on hand a supply of *Ground Bone*, and solicits the patronage of the agricultural community. Price at the Mill 35 cents per bushel, put up in casks and delivered at any part of the city at 40 cents per bushel, and no charge for casks or carting.

Also, *ground Oyster Shells*.
Orders left at the Flour Mill, near Tremont road, in Roxbury, at the New England Agricultural Warehouse and Seed Store, No. 52 North Market Street, or through the Post Office will meet with prompt attention.

A RARE CHANCE.

For sale. A partner wishing to withdraw from an old established Agricultural Implement and Seed Warehouse, having a good run of country custom, would be willing to dispose of his interest on liberal terms, as he is about engaging in other pursuits. To a person wishing to engage in a respectable and profitable business, having some ready capital, it is an opportunity rarely to be met with. A liberal credit will be given on most of the purchase money if properly secured. Any communications addressed to "Lafayette," New York city, will be treated strictly confidential.

WELLES'S PREMIUM FOR APPLES.

At a meeting of the Massachusetts Horticultural Society, in August last, it was *Voted*, that a first Premium of *thirty dollars* be awarded the second Saturday of January, 1840, for the best specimen of Apples, produced on or before that time from seedling trees, which shall have been brought into notice since year 1829.

That a second Premium of *twenty dollars*, and a third Premium of *ten dollars*, be awarded at the same time for the next best similar specimens.

That the quantity of each shall not be less than four zen.

The Committee on Fruits are particularly requested to sit at the Rooms of the Society on Saturday, the 11th day of January next, at 10 o'clock A. M. for the purpose of awarding the Premiums above mentioned, also for awarding Premiums on Fruits for the year 1839.

E. M. RICHARDS, Chairman.

WANTED.
From 5 to 10 tons of *Ruta Daga*, *Mangel Wurtzel* and *gar Peets*. Apply at C. N. HARTSHORN, corner of Washington Street, and Pleasant Street.
Boston, December 13, 1839. 21

NOTICE.
